Again, in dealing with God on behalf of man, the oneness of mind with the Father which towards man took the form of condemnation of sin, became in his dealing with the Father in relation to us a perfect confession of our sins, which was a perfect Amen in humanity to the judgment of God on the sin of man. Such an Amen was due in the truth of all things, due on our behalf, though we could not render it, due from him as in our nature and our true brother. He who was the truth, could not be in humanity and not utter it. This confession of our sins by him who, as the Son of God and the son of man in one person, could perfectly realise the evil of man's alienation—this Amen from the depths of the humanity of Christ to the divine condemnation of sin, has all the elements of a perfect repentance in humanity, for all the sin of man—all except the personal consciousness of sin; and by that perfect response or Amen to the mind of God, in relation to sin, is the wrath of God rightly met, and that is awarded to divine justice which is its due, and could alone satisfy it. This confession of the world's sin by the Head and Representative of humanity, was followed up by his intercession as a part of the full response of the mind of the Son

to the mind of the Father. 'He bore the sins of many, and made intercession for the transgressors.'

(3) F. D. Maurice professed to hold a purely biblical theology, as opposed to the theologies of consciousness, which he repudiated. His doctrine of the atonement is the answer which the Bible gives to the demands of a sin-smitten conscience. A sinner requires, and is content to be told on the authority of Scripture, that the Son of God has taken away sin. This message from God is the gospel for all men. The sinner wants to be assured that God has spoken, that he has declared himself the Reconciler, and desires to be shown how and in whom he has accomplished that work on his behalf.

To this question—How and in whom the work of reconciliation has been accomplished—Maurice replied as follows: The will of God is set forth in the Bible to be a will which is good to all, and the ground of all that is right, true, just, and gracious; the Bible also sets forth the Son of God as being one in will, purpose, and substance with the Father, and shows that his whole life on earth was an exhibition of, and submission to his Father's will. The Son of God was Lord of men, the Root and Head of humanity, and the source of all light and righteousness in man. Being thus one with God and one with man, he brought the will of God into our nature, and fulfilled it in our nature perfectly. In the fulfilment of this will in our nature, as its head, he shared its sufferings, enduring that wrath or punishment which proceeded from Holy Love; thus realising, on the one hand, the sins of the world, and on the other, the consuming fury of the holiness of the love of God, with an anguish which only a perfectly pure and holy Being, who is also a perfectly sympathising and gracious Being, can feel. The man Christ Jesus was for this reason the object of his Father's continual complacency—a complacency fully drawn out by the death of the cross—which so perfectly brought out to view the uttermost power of self-sacrifice which lay hidden in the divine love, and consequently he exhibited humanity, in its head, atoned for, reconciled.

Atonement, DAY OF. See FAST.

Atossa, daughter of Cyrus and wife successively of Cambyases, Smerdis, and Darius Hystaspes, said to have been put to death by Xerxes, her son by Darius.

Atoxyl, an arsenic compound, helpful in Sleeping Sickness (q.v.), but apt to cause blindness.

Atrato, a river of Colombia, interesting because it was repeatedly made to bear a part in schemes for a ship-canal across the Isthmus of Panamá. Rising on the Western Cordillera at an altitude of 10,560 feet above sea-level, it runs 305 miles northward through low, swampy, and unhealthy country in the department of Cauca, and falls by several mouths, interrupted by bars, into the Gulf of Darien, through the bay of Uriaba on its western side. It is navigable by steamers for fully 250 miles, being 750 to 1000 feet wide, and 8 to 70 feet deep. A route, surveyed by the United States government in 1871, proposed to connect the Atrato and the Jurador, flowing into the Pacific, by a canal 48 miles long. At the Paris International

Congress (1879) for deciding the best route for the interoceanic canal, that route was, with various others, discussed and rejected in favour of De Lesseps' line from Limon to Panamá. Gold-dust and platinum are found in and about the Atrato.

Atrauli (*Atrouli*), a town of British India, in the United Provinces, 16 miles NE. of Aligarh. Founded about the 12th century, it is well built, with wide streets, a good bazaar, and an abundant supply of water. Pop. 13,000.

Atrek, a river of Persia, rising in Khorasan, among the Hazár Masjid Mountains, and thence flowing nearly 350 miles westward to the Caspian Sea, from Shatt downwards along the boundary with Transcaspia. Its width at the mouth is usually only 30 feet, but in the spring tides it overflows its banks to a width of over two miles.

Atreus, son of Pelops, grandson of Tantalus, and elder brother of Thyestes. He was married first to Cleola, who bore him Pleisthenes, then to Érope, who had been wife of his son Pleisthenes, and who bore him Agamemnon and Menelaus, and lastly to Pelopia, daughter of his brother Thyestes. Having to flee for the murder of his half-brother Chrysippus, he came along with Thyestes to Mycenæ, and ultimately became its king. Here his wife Érope was seduced by Thyestes, who, when banished for this outrage, sent Pleisthenes to slay Atreus, but the latter slew the youth instead, not knowing him at the time to be his own son. In revenge he killed the two sons of Thyestes, and placed their flesh before the father at a banquet ostentatiously made to celebrate the reconciliation. The unhappy father fled in horror, and the vengeance of heaven, in the shape of famine, fell on Atreus for his abominable atrocity. Advised by the oracle to call back Thyestes, he went to search for him, and at the court of King Thesprotus married his third wife Pelopia, whom he believed to be a daughter of Thesprotus, but who was really a daughter of Thyestes, and at the time with child by him. This child, Ægisthus, afterwards slew Atreus when commissioned by the latter to slay his own father Thyestes. The tragic fate of the house of Pelops gave materials to the great tragic poets of Greece, whom Milton in his *Il Penseroso* speaks of as 'presenting Thebes or Pelops' line, or the tale of Troy divine.

Atri, or ADRIA. See ADRIA.

Atriplex. See CHENOPODIACEÆ and ORACHE.

Atrium, in Roman Architecture, was the hall which formed the chief part of a Roman house; into it one entered from the vestibule by the main door. It was lighted from the roof, which sloped towards an opening in the centre (the *compluvium*), through which the rain-water flowed into a kind of cistern situated on the floor (the *impluvium*). On both sides, passages led to the several chambers, and behind it was the roofless *cavedium*. In early Rome, the family gods and the nuptial couch stood in the atrium, which was used as the common public apartment, where the mistress and her maids sat spinning; but in later times it was reserved as a general waiting-room for visitors and clients.—In ecclesiastical architecture, the atrium was an open court before a church, where penitents and others stood to solicit the prayers of the faithful.

Atropa. See BELLADONNA.

Atropatene, NW. Media, now Azerbaijan.

Atrophy (Gr. *a-*, 'not,' and *trophê*, 'nourishment'), an alteration of the vital processes in a living organism, either animal or vegetable, resulting in a diminution in size and functional activity of the whole organism (general atrophy), or of certain of its organs or tissues. It may be a

natural process, as in atrophy of the thymus gland during childhood, or in general atrophy of old age, but is much more commonly the result of disease or injury. It may be caused (1) by a deficient supply of nourishment, as by starvation, or by pressure on the arteries supplying a part with blood, as when beggars produce atrophy of their muscles by tight bandaging of their limbs; (2) by excessive waste of tissue, as in fevers; (3) by diminished functional activity; (4) by loss of nerve-control, as when the skin wastes in locomotor ataxia, leprosy, &c.; and (5) by certain poisons, such as iodine, lead. Compare HYPERTROPHY, NUTRITION.

Atropine, or ATROPIA, $C_{17}H_{23}NO_3$, is an alkaloid existing in all parts of the deadly nightshade (*Atropa belladonna*). It is isomeric with hyoscyamine and hyoscyne, and can be prepared from these. The best source is Egyptian henbane. The Thorn-apple (q.v.) yields Daturine, a mixture of atropine and hyoscyne. Atropine may be prepared from the juice of belladonna by heating it to 194° F. (90° C.), filtering, and after addition of potash, shaking with chloroform. The crude alkaloid obtained after evaporation of the chloroform is purified by crystallisation from hot alcohol. The crystals occur in colourless silky needles, united in tufts. It is very poisonous, the death of a grain causing dryness of the throat; but it is nevertheless used internally or by injection in cases of whooping-cough and ptialism. It is also used as an antidote in cases of opium poisoning. A solution of sulphate of atropia in water dropped into the eye is now generally preferred to belladonna lotions or ointments for eye diseases. It produces dilatation of the pupil and paralysis of the accommodation, which do not completely pass away for some days; and also a sedative and curative effect in many inflamed conditions. A solution of about four grains to the ounce is most often employed; but a single drop of a very much weaker solution affects the pupil.

Atropos, one of the Fates. See FATE.

Attaché (Fr.), one attached to or connected with another, as a part of his suite or attendants. The term is specifically applied to young diplomats on the staff of an ambassador.

Attachment is the form of process by the authority of which the person or the goods of a debtor may in certain specified cases (see DEBT) be seized in satisfaction. As a proceeding against the person, it is a species of criminal process, and has the force of much that will be found under ARREST (q.v.). In form, it is a writ addressed to the sheriff, commanding him to attach the person against whom it is issued, and have him before the court to answer for some act or default amounting to contempt of court. Thus, in Hawkins's Pleas of the Crown, such contempts are thus classed: (1) Disobedience to the Queen's writs; (2) Contempts in the face of a court; (3) Contemptuous words or writings concerning a court; (4) Refusing to comply with the rules and awards of a court; and (5) Forgery of writs, or any other deceit tending to impose on a court. Parties are also liable to the process of attachment as for a contempt of court where, in an arbitration (see ARBITRATION) the award having been made a rule of court, the parties refuse to obey the same. In Chancery, there may be attachment of the person for judicial default or other offence to the court, as, for example, where a defendant fails to put in a proper defence to the plaintiff's statement of claim. A witness who fails to attend when duly summoned is in such event considered to have committed a contempt of court, and to be liable to be punished for such contempt by attachment.

No attachment may be issued without the leave of the court, to be applied for on notice to the party against whom it issues.

The proceeding by attachment of debts or goods in hands of a third party resembles in some respects the Scots diligence or process of arrestment (see ARRESTMENT). The best illustration we can give of it, in this sense, is that relating to the power of a judgment creditor to recover under his judgment. Under the rules of court now in force, a judgment creditor may, on an *ex parte* application, obtain a garnishee order to attach debts owing to the debtor from any third person within the jurisdiction; and the third person or Garnishee (q.v.) may be ordered to attend and show cause why he should not pay his debt to the judgment creditor. This latter proceeding is the equivalent of the action of forthcoming in Scotland. The ordinary diligence of arrestment in execution against the movable estate of a debtor, as practised in Scotland, is in England not usually called attachment, but simply execution of judgment debt.

Foreign Attachment originated in the custom whereby the citizens of London, Bristol, Exeter, and Lancaster, when suing foreigners—i.e. debtors outside the city—were entitled before judgment to attach their goods or debts in the hands of a garnishee, and so compel them to appear and plead. It is still competent in the Mayor's Court of London, though not in the High Court of Justice. It resembles the Scottish procedure of arrestment in security and *ad fundandam jurisdictionem*. See ARRESTMENT.

In the United States, attachment may be defined as the taking into the custody of the law the person or property of one who is already before the court, or of one whom it is sought to bring before the court; also a writ for this purpose. To some extent it is of the nature of a criminal process. In some states, attachments are distinguished as foreign and domestic—the former issued against a non-resident having property within the jurisdiction of the state, the latter against a resident in the state; jurisdiction over the person or property being necessary for an attachment. An attachment issued under a state law which has not been adopted by congress, or by a rule of court, cannot be sustained in a United States court. Money due to a seaman for wages is not attachable in the hands of a purser, the purser being a distributing agent of the government, and in no sense the debtor of the seaman.

Attainder (through Fr. from Lat. *attingere*, 'to touch upon'; supposed erroneously to be through Fr. from Lat. *tingere*, 'to dye,' 'taint'), in English law, was the legal consequence of sentence of death or outlawry, in respect of treason or felony. An attainder may still be produced by a judgment of outlawry; but such judgments are not in practice now pronounced. The last was in 1859. It involved *forfeiture of estate and corruption of blood*; and generally it imported extinction of civil rights and capacities. Thus, an attainted person cannot sue in a court of justice; he loses all power over his property; and he is by his attainder rendered incapable of performing any of the duties, or enjoying any of the privileges of a free citizen. It was only in cases of treason that there was an absolute forfeiture of real estate. In cases of murder and other felony (and formerly the majority of crimes were felonies), the forfeiture of lands to the crown lasted only for a year and day; and even this limited forfeiture was in 1814 confined to the case of murder. But then in such cases, by the doctrine of corruption of blood, the heir of the traitor or felon was incapacitated from succeeding, and the land reverted to the lord or superior, who was frequently the crown. Legis-

lation was passed at the time of the Jacobite rebellions to confine the effect of attainder to the person actually convicted, but it was not till 1833 that it became possible in England to trace descent through an attainted person. The forfeiture applied to honours and dignities as well as land; but where land or honours were entailed, it was held that the remainder-men or substitutes were unaffected. In Scotland, the whole law on this subject has been widely different. Forfeiture of movable estate (or escheat) occurred in every case of capital sentence—i.e. almost every felony in former times, and also in every case of outlawry. This must be distinguished from the penalty of escheat of movables which was by statute imposed for such crimes as deforcement, perjury, and bigamy. Some doubt exists as to how far *civil death* followed in the case of a condemned felon, as in the case of an outlaw. But in Scotland, except in cases of treason, the forfeiture never extended to the fee of real estate. There was a liferent escheat in favour of the superior, but even the outlaw retained a right of disposing of land. Nor was there in Scotland, except in the case of treason, anything resembling corruption of blood. Upon the other hand, the Scottish law of treason prior to the Union was in some respects more stringent than that of England. It forfeited all interests in an entailed estate or dignity. The laws of the two countries were assimilated by statute, which introduced to Scotland (though with less practical effect) the doctrine of corruption of blood. Those who desire to trace the effect of such laws on the political history of the time should examine Lord Hardwicke's work on the law of forfeiture. Formerly, an attainted person could not give evidence in a court of justice; but that disability in England has been removed by the 6 and 7 Vict. chap. 85, and in Scotland by the 15 and 16 Vict. chap. 27.

In 1870 the law on this subject was revised by the Act 33 and 34 Vict. chap. 23—which does not, however, extend to Scotland. No conviction for treason or felony now causes any attainder or corruption of blood, or forfeiture or escheat. When a convicted person is sentenced to any punishment more severe than twelve months' hard labour, he is deprived of any public office or employment, and of any public pension, or of the right of voting at elections. He may be condemned to pay the costs or expenses incurred in procuring his conviction, and in cases of felony to make payment of a sum not exceeding £100, as compensation for any loss of property caused by such felony. He cannot sue for any property, debt, or damage. While he is a convict undergoing any imprisonment, the sovereign may appoint paid administrators to take charge of his property at the convict's expense, to deal with the property, and pay debts, and do what is needful. They may also pay out of his property satisfaction for any loss or injury suffered by third parties in consequence of his criminal or fraudulent acts, though no proof of such criminal or fraudulent acts may have been made in any court of law. They may also make allowances to support the convict's family. If the crown does not appoint an administrator, justices of the peace may appoint interim curators, if satisfied that it will benefit the convict or his family, or the due administration of his property and affairs. Should any person intermeddle with the convict's property, the Attorney-general or next of kin may call them to account. When the sentence expires, then the administrators or curators are to account to him for his property. If during the sentence any property be acquired by the convict, it is not to vest in the administrators, but is to be his own.

Attainder was sometimes inflicted after death; thus, four of the regicides—Cromwell, Ireton,

Bradshawe, and Pride—were attainted posthumously.

In the United States, attainer, as it existed in England prior to the Act 33 and 34 Vict., is absolutely unknown. The Constitution of the United States forbids the enactment of any bill of attainder by congress or any of the states. Prior to the adoption of the Constitution, it was held that state laws banishing the persons and confiscating the property of individuals named for their treason, were valid; but an act of congress disbarring lawyers unless they would take an oath denying past acts of treason, has been held to be unconstitutional as a bill of attainder.

BILL OF ATTAINDER, and **BILL OF PAINS AND PENALTIES**, are bills in parliament, introduced for penally enacting the attainder and punishment of persons who have criminally offended against the state and public peace. Such a legislative proceeding was had recourse to generally in times of turbulence, when, either from the peculiar nature of the offence, or in consequence of difficulties in the application of the ordinary laws, it became necessary to resort to parliament. During the reign of Henry VIII., persons of the highest rank were frequently brought to the scaffold by such means; among whom may be mentioned the Earl of Surrey, the Earl of Essex, and others, who suffered for denying the king's supremacy. The inquiry under a bill of attainder was entirely in the hands of parliament, who might dispense at their pleasure with such rules and forms of law as appeared inconvenient or unsuitable to the purpose in hand. Accordingly, the bills were often passed upon evidence which could never have been received as sufficient, or even admissible in a court of law; and there are even instances where parties were attainted, and punished, without there being any evidence against them at all, and even without their being heard in their defence. Under the Stuarts, this extraordinary mode of proceeding in parliament was seldom had recourse to in England, and it has been still more rarely used since the accession of the House of Hanover. It has been much debated whether the attainder of Strafford (q.v.) in 1641 was constitutional. The Jacobite movement in Scotland, after the union with that country, was productive of several instances of parliamentary attainder, which, however, resulted merely in the forfeiture of the estates of the attainted parties, and in many such cases the attainder has since been removed by statute. The last instance of bill of attainder for treason was that of Lord Edward Fitzgerald, one of the leaders of the Irish rebellion of 1798. In regard to bills of pains and penalties, perhaps the two most remarkable instances are those of Bishop Atterbury (q.v.), in 1722, and of Queen Caroline, wife of George IV., in 1820.

Those who are subjected to these proceedings are admitted to defend themselves by counsel and witnesses before both Houses. In the best of times, this summary power of parliament to punish criminals by statute should be regarded with jealousy; but whenever a fitting occasion arises for its exercise, it is undoubtedly the highest form of parliamentary judicature. In impeachments, the Commons are but accusers and advocates; while the Lords alone are judges of the crime. On the other hand, in passing bills of attainder, the Commons commit themselves by no accusation, nor are their powers directed against the offender; but they are judges of equal jurisdiction and with the same responsibilities as the Lords; and the accused can only be condemned by the unanimous judgment of the Crown, the Lords, and the Commons. See Sir T. E. May (Lord Farnborough), *Privileges of Parliament* (11th edition, 1906). See also **FORFEITURE**, **IMPEACHMENT**, **TREASON**.

Attalea, a tropical American genus of palms, of the coconut and oil-palm group. *A. cohune*, which covers about two-fifths of British Honduras, yields cohune nuts, from which cohune oil is got. *A. funfera* is the source of Coquilla Nuts (q.v.) and piassava (see **FIBROUS SUBSTANCES**). Some Brazilian species yield babassu nuts. See **PALM**.

Att'alus. See **PERGAMUS**.

Attar. See **OTTO** of **ROSES**.

Attempt, in the criminal law of England and of Scotland, is any act done with the intention of committing a crime, which can fairly be described as one of a series of acts which would constitute the crime, if uninterrupted and successful. According to the rule of English law, every attempt to commit an indictable crime is a misdemeanour, except that in a few cases—e.g. murder—the attempt is a felony. In Scotland before 1887 it was competent at common law to charge a person with attempting to commit an indictable crime. The act of 1887 is declaratory of the common law, and also enables a conviction for an attempt to be obtained under an indictment charging a completed crime; the attempt to commit an indictable crime is itself an indictable crime. Under 10 Geo. IV. chap. 38 an attempt to murder is a capital crime. In the United States also the attempt to commit a crime is punishable.

Atterbom, **PETER DANIEL AMADEUS**, Swedish poet, was born at Asbo in East Gotland in 1790, and in 1805 proceeded from the gymnasium of Linköping to the university of Uppsala, where he was appointed professor of Logic (1828) and of Aesthetics (1835). He died 21st July 1855. Atterbom was the leader of the Swedish Romanticists, called 'Fosforisterna' from their organ *Phosphorus* (1810-14), of which he was editor, as also of the *Poetisk Kalender* (1812-22). His works, which present a curious blending of the hyper-romantic with German philosophy, fill thirteen volumes (1854-70). The best are *Lycksalighetens O* ('Island of Happiness'), and a cycle of romances, *Blommorna* ('The Flowers').

Atterbury, **FRANCIS**, Bishop of Rochester, was born 6th March 1663, at Milton, near Newport-Pagnell, Buckinghamshire, and educated at Westminster School, whence in 1680 he passed to Christ Church, Oxford. In 1687 he gave proof of that ready controversial talent which distinguished him through life, in a reply to a pseudonymous attack on Protestantism by Obadiah Walker, master of University College. Taking orders about the same time, he won such reputation as a preacher, that he was appointed lecturer of St Bride's (1691), a royal chaplain, and minister to Bridewell Hospital. In 1698 a sensation was created in the learned world by the Hon. Charles Boyle's *Examination of Dr Bentley's Dissertations on the Epistles of Phalaris* (q.v.). This clever, but shallow performance was really composed by Atterbury, who had been the young nobleman's tutor at Christ Church. In 1700 he distinguished himself in a controversy with Dr Wake regarding the powers and privileges of Convocation. His zealous and caustic defence of the ecclesiastical against the civil authority, procured him the thanks of the lower House of Convocation, the archdeaconry of Totnes, a canonry of Exeter, and the degree of D.D. In 1704 he was promoted to the deanery of Carlisle; in 1710 was chosen prolocutor of Convocation; in 1712 became Dean of Christ Church; and in 1713 was made Bishop of Rochester and Dean of Westminster. To Atterbury is ascribed, with great likelihood, Dr Sacheverel's famous defence (1710) before the Lords; and he was author of the scarcely less famous *Representation of the State of Religion* (1711). He may well have aspired to the primacy; but the death of Queen Anne extinguished his hopes in

that direction. His known character and Jacobite leanings made him no favourite with George I. In 1715 he refused to sign the bishops' declaration of fidelity, and some of the most violent protests of the Peers against the government measures proceeded from his reckless pen. His deep complicity in a succession of plots for the restoration of the Stuarts at length brought down upon him the charge of treason, and in 1722 he was committed to the Tower. A bill of pains and penalties was brought into the House of Commons, and passed in the Lords by 83 to 43. Atterbury, who had defended himself with great ability, was deprived of all his ecclesiastical offices, and for ever banished the kingdom. In 1723 he quitted England, and after a short stay at Brussels, settled in Paris, where he died, 15th February 1732. He sincerely believed the Stewarts would be more favourable to the Church of England than the Hanoverians, and dreaded the latitudinarian or Socinian Whig bishops. Dean Beeching holds that if he had been content to become a staunch Hanoverian, he would have been made Archbishop of Canterbury. Pope, Swift, and Bolingbroke were amongst his friends. See Macaulay's article, his *Memoirs and Correspondence* by Williams (1869), and Dean Beeching's work on him (1909).

Attestation, in Conveyancing, is the verification of the execution of deeds and wills by witnesses; hence the clause at the end of these instruments which immediately precedes the signatures of the witnesses, is called the attestation clause (see DEED, WILL, WITNESS). In the Scottish practice, the corresponding clause is called the Testing-clause (q.v.).

Attic, a term in Architecture, employed to designate a low story rising above the cornice that terminates the main elevation of a building. Such a structure was usually of the *Attic order*, having square columns or pilasters instead of pillars. In domestic architecture, the word is usually applied to sky-lighted rooms in the roof.

Attica, one of the political divisions or states of Hellas or ancient Greece, of which Athens was the capital. Its area was about 640 sq. m., rather smaller than that of Lanarkshire. The territory is of triangular shape, having its north-east and south-west sides washed by the sea, while on the north it is connected with the mainland. In ancient times it was bounded on the W. by Megaris and the Saronic Gulf; on the S., which ran out into the 'marble steep' of Sunium, by the Ægean Sea; on the E. by the Ægean Sea; and on the N. by Boeotia, from which it was separated by a lofty range of hills, the most famous part of which was formerly called Cithæron. Ancient Attica was thus walled in from the rest of Greece; whilst within its own limits rose Mount Parnes (4634 feet), Pentelicon (3641), Hymettus (3368), Ægaleus (1535), Lycabettus (911), and the Athenian Acropolis (513). The largest plains extend in the neighbourhood of Athens and Eleusis. The two principal rivers were the Cephissus and Ilissus, which, if they exhibited the same features in ancient times as they do now, must have been mere mountain-torrents, dry in summer. The unfruitfulness of the soil, and the scarcity of water, compelled the inhabitants occasionally to send out colonies. As early, however, as the time of Solon, Attica was well cultivated, and produced wine and corn. Mount Hymettus was celebrated for its bees and honey, and metals were found in the range of Laurium. Figs, olives, and grapes are still cultivated. Goats and sheep find suitable pasturage; but the country does not now produce much grain. According to ancient tradition, the Autochthons of Attica were first civilised under Cecrops, who is said

to have come thither from Sais, at the mouth of the Nile in Egypt, about 1550 B.C., and to have introduced the culture of olives, and of several species of grain, as also to have implanted milder manners, and taught the worship of the gods. He is stated to have divided the country into twelve communities or states. This, however, was not the only division known in early Attica. A still older division into *phylai*, or tribes, existed, as also a minute subdivision into *démoi*, or townships. By Theseus Athens was united with the eleven other states of Attica under one government, of which Athens was made the seat. After this union of the several states, the whole of Attica shared in the fortunes of Athens (q.v.), and, under Vespasian, became a Roman province. On the division of the Roman empire, Attica naturally fell into the hands of the Greek emperors. In 396 A.D. it was captured by Alaric, king of the Goths. What may have been its population in ancient times it is impossible to determine precisely. Clinton estimated it at upwards of half a million, but this is probably exaggerated. To-day Attica (with Boeotia) forms a nonarchy or government in the kingdom of Greece, with an area of 2300 square miles, and a population of over 580,000.

Atticus, TITUS POMPONIUS, was born in Rome 109 B.C., or three years before the birth of Cicero, along with whom and the younger Marius he received a good education. In 85 B.C. he withdrew to Athens, glad to be separated from the political distractions of his native land. After 65 B.C., when Sulla induced him to return to Rome, he still devoted himself chiefly to study and the pleasures of friendship, and refused to take any part in politics. Yet he was by no means without influence on public affairs, as he lived on terms of familiar intercourse with several leading statesmen, and freely gave his counsel, which was generally sound and wholesome, while it was always benevolent. He was a man of great wealth, having been left a large inheritance by his father and his uncle, which he greatly increased by judicious speculations. His mode of life was frugal. In 32 B.C. he was informed that a disorder under which he was labouring was mortal, and died after five days of voluntary starvation. An Epicurean in philosophy, he was intimately acquainted with both Greek and Roman literature, and his taste was so good that Cicero used to send him his works for the benefit of his revision. None of his own writings have been preserved, but we have a series of 396 epistles addressed to him by Cicero in 68 to 44 B.C. His life by Nepos is a panegyric rather than a biography. See Boissier, *Cicero and his Friends* (trans. 1897).

Attila (Ger. *Etzel*; Hungarian, *Ethel*), the 'Scourge of God,' was born about 406, the son of Mundzuk, a chief of the Huns, and in 434 succeeded his uncle Rhuas as chief of countless hordes scattered from about the Caspian to the Danube. His brother Bleda shared with him the supremacy over the Huns, but was put to death about 444 by Attila, whom the Huns regarded with superstitious reverence, and Christendom with superstitious dread. Men believed that he was armed with the sword of the Scythian war-god, which must win dominion over the whole world. It is not certain when the name 'Scourge of God' was first applied to Attila; but he is said to have received it from a hermit in Gaul. The whole race of Huns was regarded in the same light. In an inscription at Aquileia, written a short time before the siege in 452, they are described as *imminentia peccatorum flagella* ('the threatening scourges of sinners'). The Vandals, Ostrogoths, Gepids, and many of the Franks, fought under Attila's banner, and in a short time his dominion extended over the people of Germany

and Scythia—from the Rhine to the frontiers of China. In 447, after an unsuccessful campaign in Persia and Armenia, he advanced through Illyria, and devastated all the countries between the Black Sea and the Mediterranean. Those inhabitants who were not destroyed were compelled to follow in his train. The Emperor Theodosius collected an army to oppose the barbarians' inrush, but in three bloody engagements fortune declared against him. Constantinople owed its safety solely to its fortifications and the ignorance of the enemy in the art of besieging; but Thrace, Macedonia, and Greece were overrun; seventy flourishing cities were desolated; and Theodosius was compelled to cede a portion of territory south of the Danube, and to pay tribute to the conqueror, after treacherously attempting to murder him. In 451 Attila turned his course westward, and invaded Gaul, but here was boldly confronted by Aetius, leader of the Romans, and Theodoric, king of the Visigoths, who compelled him to raise the siege of Orleans. He then retired to Champagne, and in the wide plain of the Marne—called anciently the Catalaunian Plain—waited to meet the enemy. The army of the West, under Aetius and Theodoric, encountered the forces of the Huns near the site now occupied by the city of Châlons-sur-Marne. Both armies strove to obtain the hill of moderate height which rises near Murry, and commands the field of battle, and after a terrible contest, the ranks of the Romans and their allies, the Visigoths, were broken. Attila now regarded victory as certain, when the Gothic prince, Thorismund, immediately after his father had fallen, assumed the command, and led on the brave Goths, who were burning to avenge the death of Theodoric. Their charge from the height into the plain was irresistible. On every side the Huns were routed, and Attila with difficulty escaped into his encampment. This, if old historians are to be trusted, must have been the bloodiest battle ever fought in Europe; for it is stated by contemporaries, that not less than 252,000 slain were left on the field—a field, says tradition, yet haunted by their spectres. Attila, retiring within his camp of wagons, collected all the wooden shields, saddles, and other baggage into a vast funeral pyre, resolved to perish in the flames rather than yield; but by the advice of Aetius, the Roman general, the Huns were allowed to retreat without much further loss, though they were pursued by the Franks as far as the Rhine. In the following year Attila had recovered his strength, and made an incursion into Italy, devastating Aquileia, Milan, Padua, and other cities, and driving the terrified inhabitants into the Alps, the Apennines, and the lagoons of the Adriatic, where they founded the city of Venice. The Roman emperor was helpless, and Rome itself was saved from destruction only by the personal mediation of Pope Leo I., who visited the dread barbarian, and is said to have subdued his ferocity into awe by the apostolic majesty of his mien. This deliverance was regarded as a miracle by the affrighted Romans, and old chroniclers relate that the apostles Peter and Paul appeared in Attila's camp, and changed his purpose. By 453, however, he seems to have forgotten their visit, for he made preparations for another invasion of Italy; but he died on the night of his marriage with the beautiful Ildiko, or Hilda, perhaps by her hand, more probably of hemorrhage. His death spread consternation through the host of the Huns. They cut themselves with knives, and shaved their heads, and then prepared to celebrate the funeral rites of their king. It is said that his body was placed in three coffins—the first of gold, the second of silver, and the third of iron; that the caparisons of his horses, with his arms and ornaments, were buried with him; and that the captives employed to make his grave were all put to death,

that none might betray the resting-place of Attila. See HUNS; E. Hutton, *Attila and the Huns* (1915); also Gibbon, and Thierry's *Attila* (6th ed. 1876).

Attis, or **ATYS**, a native deity of Lydia and Phrygia, associated in worship with Cybele, originally a shepherd beloved by the goddess. The myth includes his self-emasculation and his being transformed into a fir-tree. See Sir J. G. Frazer's *Attis, Adonis, Osiris*.

Attleboro, a manufacturing city in Massachusetts, U.S., 32 miles SW. of Boston; pop. 20,000.—North Attleborough is a separate town; pop. 10,000.

Attleborough, an old market-town of Norfolk, 15 miles SW. of Norwich; pop. 2500.

Attock, a town and fort of the Punjab, on the left or east bank of the Indus. Attock stands below the fort, a parallelogram of 800 yards by 400, established by the Emperor Akbar in 1581, to defend the passage of the river, but it is no longer a position of strength. The road and railway bridge across the Indus here was opened in 1883. It has five arches 130 feet high, and renders continuous the railway connection between Calcutta and Peshawur (1600 miles). The situation of Attock is important, whether in a commercial or in a military view. It is at the head of the steam-boat navigation of the Indus, being 940 miles from its mouth; while, about 2 miles above it, the Cabul River, the only considerable affluent of the Indus from the west, is practicable for vessels of 40 or 50 tons for a distance of 50 miles. The valley, again, of this last-mentioned stream, presenting, as it does, the best approach to the east and south from Central Asia, has been the route of nearly all but the maritime invaders of India from the days of Alexander the Great downwards. *Taxila*, where the Macedonians crossed the Indus, has been identified with Attock.

Attorney ('one appointed,' from the old verb *attorn*, 'turn, assign, or appoint'), a term of English law, used in a general sense to describe any person authorised to act on behalf of another, as, for example, the holder of a power or letter of attorney authorising him to sell property or do some other act on behalf of the grantor. 'Attorney-at-law' was formerly the proper style of those members of the legal profession who represented litigants in the courts of common law, and retained counsel on their behalf; but since the Judicature Act, 1873, it has been superseded by the designation of Solicitor (q.v.).

In the United States, the term attorney-at-law is used for one standing in the place of another in matters of law, including in itself the special offices designated in English and Scots law by the terms advocate, attorney, barrister, counsellor-at-law, lawyer, proctor, and solicitor, although all these terms, except barrister, are sometimes used as applicable to the attorney-at-law in the performance of the duties pertaining to his office.

The attorney-at-law is not a governmental officer, but is an officer of the court, responsible to the court under whose immediate supervision he is, for the faithful performance of his duties. He has property in his office, and although he may be punished summarily for official misconduct occurring in open court, he cannot be removed from his office without special cause and without having an opportunity to be heard by himself or counsel.

Empowered to stand in the place of his client in all matters of law, he performs all acts necessary for the successful prosecution or defence of his suit, not only in the office preparation of the cause, but also in arguing the same in open court.

Each state prescribes by statute the qualifications of its own attorneys, but generally a pre-

liminary examination as to educational qualifications is required, followed by a clerkship of from two to four years in the office of a regular practising attorney of known ability, whose duty it is to register the name as a student-at-law in the office of the prothonotary of the county; after this comes an examination as to legal attainments by a board of examiners appointed by the court, or graduation as Bachelor of Laws at a law college or university. A good moral character is always demanded.

Any person who has been admitted to the highest court of a state is eligible for admission to the district and circuit courts of the United States for that state, but to be admitted to the Supreme Court of the United States, it is necessary that an attorney shall have for three years been a practitioner in the Supreme Court of the state to which he belongs, and that his private and professional character shall be fair. His oath of office requires him to support the constitutions of his state and of the United States, and to behave himself with all fidelity to the court and to the client—hence citizenship of the United States and of the state are requisite.

The efforts of women to be admitted as attorneys-at-law in the state courts since 1870, and the refusal of the Supreme Court of the United States to admit women as attorneys, resulted in the enactment by congress, in 1879, of the following statute: 'Any woman who shall have been a member of the bar of the highest court of any state or territory, or of the Supreme Court of the district of Columbia for the space of three years, and shall have maintained a good standing before such court, and who shall be a person of good moral character, shall on motion and the production of such record, be admitted to practise before the Supreme Court of the United States.' Under this act, several women who have complied with its provisions have been admitted to practise as attorneys-at-law in the Supreme Court of the United States, but some of the states do not yet admit women to practise as attorneys. In 1887 about one hundred women, married or single, had been admitted as attorneys in the United States.

An attorney's warrant of attorney must be commensurate with the work to be done. The fiduciary relation between attorney and client cannot be delegated. In case of his death, service of papers cannot be made upon his law partner or executor, neither can he withdraw from the case without leave of the court. If removed by his client, which in most cases must be done by leave of court, he has a lien upon the papers in the cause for his fee.

An attorney-at-law is required to act with the utmost diligence and fidelity to his client, but his undertaking is not that he possesses perfect legal knowledge or the highest degree of skill in relation to the business he undertakes, but that he possesses the ordinary legal knowledge and skill common to members of the profession, and that in the discharge of his duties he will exercise ordinary and reasonable diligence, care, and prudence; he is therefore liable to his client for negligence by which damage is sustained. An attorney is trustee for his client for money collected, and after demand has been made upon him, he may be sued without notice. His authority to compromise a suit must be given him by his client. His confidential communications with his client are privileged, and are not to be revealed even on the witness stand.

Attorney-general, the title by which, in England and Ireland, the first ministerial law officer of the crown is known. The attorney-general is appointed by letters-patent. His office, powers, and duties correspond in many respects to those

that belong to the Lord Advocate (q.v.) in Scotland, though the powers of the latter functionary are more extensive and less clearly defined. Originally, the attorney-general was simply the king's attorney, and stood to the sovereign in the same relation as any other attorney does to his employer. The term 'general' was afterwards conferred to distinguish him from attorneys appointed to represent the interests of the crown in particular courts, such as the Court of Wards; or from the master of the crown office, who is called the 'Counser and Attorney for the King.' The early history of this office is involved in obscurity. Though there can be no doubt that the crown must always have been represented by an attorney in the courts of justice, the first record of the designation *Attornatus Regis* belongs to the reign of Edward I. (1272-1307). Up to a period comparatively recent, the king's serjeant was the chief executive officer of the crown in criminal proceedings, and this circumstance gave rise to various questions of difficulty as to the right to precedence of these officers respectively. These questions were set at rest in 1811 by a special warrant of the then Prince Regent, afterwards George IV., by which it was declared that both the attorney and solicitor general should have place and audience before all other members of the English bar. A similar question arose in a Scottish appeal in the House of Lords in 1835, between the Attorney-general and Lord Advocate, which was also decided in favour of the former. The following may be enumerated as the principal duties of the attorney-general: 1st, To exhibit informations and conduct prosecutions for crimes which have a tendency to disturb the peace of the state or endanger the constitution (see PLEA); 2d, To advise the government on legal questions; 3d, To conduct prosecutions and suits relating to the revenue; 4th, To file informations in the Exchequer for personal wrongs committed on any of the possessions of the crown; 5th, To protect charitable endowments in the sovereign's name, as *parens patrie*, and, generally, to appear in all legal proceedings in which the interests of the crown are at stake. The attorney and solicitor-general were *ex officio*, till 1883, Commissioners of Patents (q.v.). The powers of the solicitor-general are co-ordinate with those of the attorney-general, and in the absence of the latter, or during a vacancy, the former may perform his functions in all their extent. Both usually have seats in the House of Commons, and their tenure of office concurs with that of the government of which they are members. They were formerly paid by fees, but now by fixed salary.

The duchies of Lancaster and Cornwall, and the county palatine of Durham, have separate attorney-generals.

Under the United States government, the attorney-general is one of the seven officials who constitute the president's cabinet. These officers are appointed by the president, confirmed by the senate, and removable at pleasure. The attorney general is the head of the Department of Justice, and his duties are to give advice and opinions to the president, or any of the heads of the executive departments on questions of law arising in their respective departments. He argues suits in the United States courts when considered necessary, provides legal service on behalf of the government in the prosecution or defence of suits at law, examines titles to lands purchased by the United States for public use, and exercises a general superintendence over the minor officials of the United States courts. His salary is \$8000 per annum. Nearly all of the states of the Union have attorney-generals, who are in some instances appointed by the governors, in others elected by the

people. Their duties under the state governments correspond essentially with those of the United States attorney-general under the general government.

Attraction. The mutual action between any two bodies is termed stress. When the stress tends to separate the bodies, or to prevent their mutual approach, it is termed a pressure or repulsion. When the stress is such that the bodies tend to approach each other, it is termed a tension or attraction. The words repulsion and attraction are used when the bodies are considered to influence each other directly; but when the action is considered to be propagated through an intervening medium, the terms pressure and tension are used. Newton believed that no action could be propagated except through a medium. Electric and magnetic phenomena have been very completely accounted for by the action of a medium (see **ELECTRICITY**). Attempts to explain gravitation by such action have not been so successful. Several discussions connecting gravitation with an electrical structure of matter, or with wave propagation through the æther, have been given recently. Kelvin showed that Cohesion (q.v.) can be explained by the Newtonian law of gravitational attraction. See **GRAVITATION**, **CAPILLARITY**, **CHEMISTRY**, **MAGNETISM**, **RELATIVITY**.

Attrek. See **ATREK**.

Attribute. In Logic, is used to denote the opposite of substance. The latter is considered to be self-existent, while the former can only be conceived as possessing a dependent existence. Attributes are commonly said to belong to substances. Thus, wisdom, holiness, goodness, and truth are termed attributes of God, who is Himself regarded as the substance in which they inhere; in the same way, whiteness is called an attribute of snow.

Attwood, THOMAS, musician, was born in London in 1765, and during 1783-87 studied at Naples under Cinque and Latilla, at Vienna under Mozart. With some other appointments, he held that of organist of St Paul's from 1796 till his death, 24th March 1838. His works, more tuneful than nervous, include two coronation anthems, songs, glees, and pianoforte pieces.

Atwood's Machine, an instrument for illustrating the relations of time, space, and velocity in the motion of a body falling under the action of gravity. It was invented by George Atwood or Attwood, a mathematician of some eminence, who was born in 1745, educated at Cambridge, became fellow and tutor of Trinity College in that university, published a few treatises on Mechanics and Engineering, and died in 1807. It is found that a body falling freely passes (roughly) through 16 feet in the first second, 64 feet in the first two seconds, 144 feet in the first three seconds, and so on. These spaces would require a machine of impracticable size to illustrate the relations just mentioned. Or, if a conveniently small machine were used, the times to be observed would be so short that they could not be accurately measured by ordinary means. The object of Atwood's machine is to reduce the scale on which gravity acts without in any way altering the nature of its actions. The machine consists essentially of a pulley, P (see fig. 1), moving on its axis with very little friction, with a fine silk cord passing over it, sustaining two equal cylindrical weights, *p* and *g*, at its extremities. The pulley rests on a square wooden pillar, graduated on one side in feet and inches, which can be placed in a vertical position by the levelling-screws of the sole on which it stands. Two stages, A and B, slide along the pillar, and can be fixed at any part of it by means of fixing-screws.

One of these stages, A, has a circular hole cut into it, so as to allow the cylinder, *p*, to pass freely through it; the other is unbroken, and intercepts the passage of the weight. A series of smaller weights, partly bar-shaped, partly circular, may be placed on the cylinders in the way represented in figs. 2 and 3. A pendulum usually accompanies the machine, to beat seconds of time. The weights of the cylinders, *p* and *g*, being equal, they have no tendency to rise or fall. When a bar is placed on *p*, the motion that ensues is due only to the action of gravity upon it, so that the motion of the whole must be proportionately slower than when all is falling freely. Suppose, for instance, that *p* and *g* are each $7\frac{1}{2}$ ounces, and that the bar is 1 ounce, the force acting on the system—leaving the friction and inertia of the pulley out of account—would be $\frac{1}{16}$ of gravity, or the whole would move only 1 foot in the first second, instead of 16. By a proper adjustment of weights, the rate of motion may be made as small as we please. The various formulæ (see **KINEMATICS**) connecting time, speed, and space fallen through under gravity can be experimentally verified by such an instrument. For example, if the weight of *p* be increased by a small amount, and the space it falls through in one second be noted, it is found that after two seconds it has fallen through four times that space, and so on. Thus, the space fallen through from rest is proportional to the square of the time occupied in falling. In practice this law would not be directly verified. Allowance has to be made for the inertia of the pulley, which is also driven by the weight of the bar, and for the effect of friction.

Atwood's Machine.

Aubagne, a town in the French department of Bouches-du-Rhône, on the river Huveaune, $10\frac{1}{2}$ miles E. of Marseilles by rail. The *Albania* of the Celtic Albici, it has a ruined castle, and a monument (1828) to the Abbé Barthélemy, and it trades in fruit and wine. Pop. 6000.

Aube, a department in the north-east of France, occupying the southern part of the old province of Champagne and a small portion of Burgundy, bounded by Marne, Haute-Marne, Yonne, and Seine-et-Marne. The eastern part belongs to the basin of the river Aube; the western to that of the Seine. Area, 2300 sq. m.; population, 228,000. The climate is moist but healthy. A great portion of the area is arable land. The north-east is chiefly pastoral; but the south-east is far more fertile, rich in meadow-land and forest, and producing grain, hemp, rape, hay, timber, and wine. The minerals are iron, building-stone, marble, chalk, marl, and potters' clay. Many persons are employed in the iron-industry, in cotton-spinning and weaving, in silk-spinning, and in the production of cloth, porcelain, faience, glass, paper, soap, and rape-sugar. There is an active commerce in wine, timber, and country produce by the railways, with which the department is covered, and of which its capital,

Troyes, is the centre. The river Aube rises near Mount Saule, on the plateau of Langres, and flows 140 miles north-westward by La Ferté, Bar, and Acri, to the Seine.

Aubenas, a town of SE. France, in the department of Ardèche, 50 miles NNE. of Alais by rail. It is built on a height rising 688 feet above the river Ardèche, and has a fine old castle. The inhabitants are employed in coal and iron mining, tanning, paper-making, and silk-culture; and the town is a great silk emporium. Pop. 4000.

Auber, DANIEL FRANÇOIS ESPRIT, a composer of operas, was born at Caen in Normandy, January 29, 1782. His father, who was a printseller in Paris, sent him to London to acquire a knowledge of business. But his irresistible passion for music obtained the upper-hand, and after a short stay he returned to Paris. Among his earliest compositions may be noticed his very successful *concertos* for the violoncello, the concerto for the violin, and the comic opera, *Julie*. Aspiring to greater things, he now devoted himself to a deeper study of music under Cherubini, and wrote a mass for four voices. His next work, the opera *Le Séjour Militaire* (1813), was coldly received; but the death of his father compelled him to be dependent on his profession. In 1819 appeared *Le Testament et les Billets-doux*, which was also unsuccessful; but in *La Bergère Châtelaïne* (1820) he laid the foundation of his subsequent fame. In all these early essays he displayed a style of his own; and though afterwards he was profoundly influenced by Rossini, his work has always a distinctive character. In 1822 he became associated with Scribe, who provided him subsequently with librettos admirably adapted to his music. Most of Auber's operas correspond to Scribe's comedies of Parisian life. Instead of deep natural feelings, they reflect elegant and brilliant French manners and conversation; the music is melodious, graceful, entertaining, but for the most part deficient in depth of thought and feeling. By far the most important and successful of his operas is *La Muette de Portici*, usually known as *Masaniello* (1828); of the lighter works, *Fra Diavolo* (1829) is the best known. Of his forty operas the next most notable are *Le Domino Noir* (1837); *Les Diamants de la Couronne* (1841), *Haydée* (1847), *La Fiancée du Roi de Garbe* (1864), and *Rêves d'Amour* (1869). He composed a work for the London Exhibition of 1862. He was a member of the Institute, director of the Conservatory of Music, and commander of the Legion of Honour. He died at Paris, May 13, 1871.

Aubergine. See EGG-PLANT.

Aubervilliers, one of the northern suburbs of Paris, with manufactures of rubber, perfumes, beer, glass, and chemicals. Its fort used to be important for the defence of Paris. Pop. 40,000.

Aubigné, MERLE D'. See D'AUBIGNÉ.

Aubrey, JOHN, antiquary and folklorist, was born at Easton Percy, near Chippenham, in Wiltshire, 12th March 1626, and was educated at Malmesbury, under Latimer, Hobbes's preceptor, at Blandford grammar-school, and at Trinity College, Oxford. He entered the Middle Temple in 1646, but was never called to the bar; in 1652 he succeeded to estates in Wiltshire, Herefordshire, and Wales, but was forced through lawsuits to part with the last of them in 1670, and with his books in 1677. His last years were passed, in 'danger of arrests,' with Hobbes, Ashmole, and other protectors, till in June 1697 he died at Oxford, on his way back from London to Draycott. His quaint, credulous *Miscellanies* (1696) was the only work printed in his lifetime; but he left a large mass of materials. Of these, his Wiltshire and Surrey collections have

in part been published; his 'Minutes of Lives' (Hobbes, Milton, Bacon, &c.), given to Antony a Wood, first appeared in 1813 (better edition by A. Clark in 1898); and his *Remains of Gentilism and Judaism* was issued by the Folklore Society in 1880.

Aubrietia, a genus of small purple-flowered Cruciferae, natives of the mountains of Greece, Italy, &c., grown in rock gardens. They resemble rock-cress (*Arabis*) in habit.

Auburn, the name of several places in the United States. (1) The most important of these is in the state of New York, 173 miles W. by N. of Albany. The outlet of Owasco Lake flows through the town, furnishing a water-power which is employed in mills of various kinds, and in manufactures of agricultural machinery on a large scale, wool, cotton, silk, carpets, iron, boots, shoes, flour, and paper. Since 1823 the state prison has been conducted on the 'silent' or 'Auburn' system. There are also a state asylum and a state almshouse. Pop. (1870) 17,225; (1880) 21,924; (1920) 36,192. —(2) A city of Maine, on the west bank of the Androscoggin River, by which it is separated from Lewiston, 35 miles N. of Portland by rail. It has manufactures of cotton, furniture, and boots and shoes. Pop. 17,000.

Aubusson, a town in the French department of Creuse, in the rocky gorge of the Creuse, 47 miles ENE. of Limoges, which produces carpets, tapestry, and cotton and woollen goods. Pop. 6400.

Aubusson, PIERRE D'. See D'AUBUSSON.

Aucassin, hero of a 12th c. French romance which records the love of Aucassin, son of the Count of Beaucaire, for Nicolette, the captive daughter of the king of Carthage. It has been often translated, as by Bourdillon (1887), A. Lang, Gibb, Henry and Thomson, and Housman (1903).

Auch, the capital of the French department of Gers, on the river Gers, 44 miles S. of Agen by rail. The *Augusta Auscorum* of the Romans, it is built on a hill, whose summit is crowned by the cathedral (1489-1662), rich in stained glass and carved woodwork. A flight of 200 steps leads up to it from the river. The chief articles of trade are woollen and cotton stuffs, fruits, wine, and the brandy of Armagnac. Pop. 9000.

Auchenia. See LLAMA.

Auchinleck, an Ayrshire town, 15 miles E. of Ayr by rail; population, 2500. The parish contains Auchinleck House (locally called 'Place Affleck'), the seat of the Boswell family. Here, beside this mansion, Sir Alexander Boswell, son of Johnson's biographer, established in 1815 the *Auchinleck Press*, for printing MSS. and rare works, such as the Romance of Sir Tristrem, the Disputation between John Knox and the Abbot of Crossraguel, &c. See BOSWELL.

Auchterarder, a Perthshire town, 14½ miles SW. of Perth by rail; population, 2300, largely employed in the woollen manufacture. Gleneagles golf-course is close by. Popular opposition to the presentee to the church of Auchterarder originated (1834) the struggle which ended in the formation of the Free Church in 1843.

Auckland, the northern provincial district of New Zealand, includes fully a half of North Island, and is about 400 miles long by 200 wide at its greatest breadth. The bays of its coast-line afford safe harbourage, and its rivers serve as highways for the produce of the interior. There are three almost natural divisions of this district: North Peninsula, East Coast, and the Waikato Country—the latter two, which had been mainly in the hands of the natives, have lately been opened up for European settlement. The land

is chiefly of two kinds—a light volcanic loam, and a stiff yellow clay. For the most part it is broken, with low ranges of hills and broad shallow valleys, covered to a great extent with dense forests, of which great areas have been cleared. It is more suited for grazing than for agricultural purposes. Gold, copper, tin, iron, coal, and other minerals exist in Auckland, which is also very rich in timber, the most important tree being the Kaui pine. The fossil gum of ancient forests of this pine is dug up in large quantities, and exported. Much New Zealand flax is grown and manufactured. The forests, of which over 3,500,000 acres still exist, are being utilised for timber; many sawmills are engaged in the industry. Dairying is an industry yearly increasing in importance, factories and creameries employing a large number of hands. Fruit canning and preserving, fisheries, the manufacture of Portland cement, paper-making, and many other industries are also steadily progressing. The exports include wool, Kauri gum, timber, flax, and gold. The climate is pleasant and healthy, and owing to sea-breezes the summer heat is not so great as in other parts of Australasia in the same latitude. Extensive areas of state lands have been set aside as reserves for the sake of their scenery and for the preservation of the Kaui pine. The township of Rotorua, on the shores of Rotorua Lake, 171 miles by rail from Auckland, is the centre of the famous hot-lake district, with its hot springs, cisterns of hot water, and mud geysers. There are valuable springs of acid and alkaline sulphurous waters at Rotorua, Lake Taupo, and elsewhere, which are much frequented both for drinking and bathing. The wonderful pink and white terraces near Tarawera Lake were destroyed by a volcanic eruption in 1886. The white terrace, which had the appearance of a crystal staircase, glittering and stainless, as of ice, was produced by deposits of silica from the boiling springs; the pink terrace, its companion, was flushed with a pale rose colour, believed to have been caused by the presence of oxide of iron. Auckland was the scene of the labours of Bishops Selwyn and Patteson. The population in 1875 was 79,104; (1881) 99,451; (1901) 175,860; (1921) 369,618 (excluding Maoris).

Auckland, the largest city in the North Island of New Zealand, situated on a peninsula about 7 miles wide on the Hauraki Gulf. It stands on the south side of Waitemata Harbour, one of the finest harbours in New Zealand, with sufficient depth of water for the largest steamers afloat; and its splendid wharves and graving-docks offer the most complete facilities for shipping. Auckland is distant from Sydney 1315 miles; from Melbourne, 1650; and has regular steam communication with both. It possesses also a harbour on the western side of the island in Manukau, only six miles across. It is surrounded by numerous thriving villages, with several of which it is connected by railway. Auckland contains a well laid out botanical garden and public parks, and shows numerous public buildings, government house, exchange, post-office, custom-house, banks, hotels, churches, and barracks. Most of the stores and shops are of a substantial character. It has a university college and Anglican and Roman Catholic cathedrals, a museum, an academy of music, and a Free Library and Art Gallery. The temperature is singularly equable and free from extremes of heat and cold: the mean average temperature in shade is 59.6° F. The industrial establishments include brick, pottery, cement, and glass works, sawmills, shipbuilding yards, and meat-preserving works; sugar refinery, boot factory, &c. Auckland has connection with all the chief centres of New Zealand by telegraph. Pop. (1881) 16,675; but including suburban districts, 30,952; (1921), with suburbs, 157,757. The

city was founded in 1840, and was named in honour of Lord Auckland, then governor-general of India. It was the capital of New Zealand up to 1865.

Auckland. See BISHOP-AUCKLAND.

Auckland, WILLIAM EDEN, LORD, statesman and diplomatist, third son of Sir Robert Eden, Bart., of West Auckland, Durham, was born in 1744, educated at Eton and Oxford, and called to the bar in 1768. In 1772 he was appointed Under-secretary of State, and afterwards filled the offices of Lord of Trade, commissioner to treat with the American insurgents, chief secretary to the Irish viceroy, minister-plenipotentiary to France (concluding a commercial treaty with that country, 1786), ambassador to Spain, ambassador to Holland, and postmaster-general. In 1788 he was raised to the Irish, in 1793 to the British, peerage as Baron Auckland. He died May 28, 1814. Besides *Principles of the Penal Law* (1771), we have his *Journal and Correspondence* (4 vols. 1860-62).—His son, GEORGE EDEN, EARL OF AUCKLAND, was born in 1784, and in 1814 succeeded as Lord Auckland. A steadfast supporter of Reform, he held two or three offices, and in 1835 was appointed governor-general of India. As such, in 1838, he plunged into the unhappy Afghan war, whose successful beginning procured him his earldom. Superseded in 1841, he returned to England, and died Jan. 1, 1849. See *Life by Trotter* (1895).

Auckland Islands, a group of islands about 290 miles to the south of New Zealand. The largest of them measures 27 miles by 15. It has two good harbours, and is covered with the richest vegetation. The Auckland Islands are valuable chiefly as a whaling station, but are not peopled. They form part of the Dominion of New Zealand.

Auction (Lat. *auctio*). The character of this convenient mode of offering property for sale is correctly indicated by the name, which means an arrangement for increasing the price by exciting competition amongst purchasers. In the *Dutch Auction* of the 'Cheap Jack,' the usual mode of proceeding is reversed, the property being offered at a higher price than that which the seller is willing to accept, and gradually lowered till a purchaser is found. The *Scottish roup* differs from the ordinary auction in having a judge of roup, and in sales of land an 'upset' price. In sales for redemption of land-tax in England, the bidding is often for the smallest quantity of land to be taken for a fixed sum. 'Conditions of Sale,' or 'Articles of Roup,' as they are called in Scotland, constitute the terms on which the seller offers his property, and form an integral part of the contract between seller and purchaser. The contract is completed by the offer or bid on the part of the purchaser, and the acceptance by the seller or his representative, which is formally declared by the fall of the auctioneer's or salesman's hammer, the running of a sandglass, the burning of an inch of candle (hence the term 'sale by the candle'), or any other means which may have been specified in the conditions of sale. Mere advertisement does not make a contract. These conditions or articles ought further to narrate honestly and fully the character of the object or the nature of the right to be transferred, to regulate the manner of bidding, prescribe the order in which offerers are to be preferred, and to name a person who shall be empowered to determine disputes between bidders, and in cases of doubt to declare which is the purchaser. Before the sale commences, these conditions, which are executed on stamped paper, are read over, or otherwise intimated to intending purchasers, but it is sufficient if they are posted up in the auction room. The conditions, thus published,

cannot be controlled by any verbal declaration by the auctioneer. Even the statements in a catalogue, or particulars of an estate, cannot be varied by statements of auctioneer. It is understood that an auctioneer may puff his goods. The implied conditions, which, in addition to those thus expressed, are binding on the seller and purchaser in all auctions, are: (1) That the seller shall not attempt to raise the price by means of fictitious offers, but shall fairly expose his goods to the competition of purchasers; and (2) That the purchasers shall not combine to suppress competition. It is usual to stipulate for a deposit varying from 5 to 25 per cent. by the purchaser, either with the auctioneer or (in sales of land) with the seller's solicitor. Much doubt has arisen as to the lawfulness of biddings for the exposer, through the auctioneer or by others. The exposer may set a price below which the thing is not to be sold, which is best and most openly done by fixing an upset price, or he may expressly reserve to himself a power to offer. The Sale of Goods Act, which is applicable to both England and Scotland, provides (sec. 58) that when a sale by auction is not notified to be subject to a right to bid on behalf of the seller, it is unlawful for the seller to bid himself, or to employ another to bid, or for the auctioneer knowingly to take any bid from the seller or a person employed by him to bid. Any sale contravening this rule may be treated as fraudulent by the buyer. Where an unlawful offer is made for seller, the remedy is to set aside this, and the contract holds with the last *bona fide* offerer. Nearly all sales by order of court take place by auction, and the same course is directed by numerous statutes, as the Pawnbrokers Act, the Summary Jurisdiction Act with regard to distresses, &c.

Auctioneer, the person who conducts an Auction (q.v.). The auctioneer is in a certain sense the agent both of seller and purchaser, and by the fall of his hammer, or by writing the purchaser's name in his book, he binds him to accept the article sold at the price indicated. The auctioneer may also, and frequently does, act as agent for absent purchasers, or for persons who have instructed him to make biddings for them during the sale. In both cases, however, the purchaser must be *bona fide*, otherwise the auctioneer would himself become a 'puffer.' As to the circumstances in which he may bid for the seller, see AUCTION. Where the auctioneer declines or omits to disclose the seller's name, he undertakes the responsibilities of the latter to the purchasers. To the seller, again, he is responsible for ordinary skill, assiduity, and prudence. Every auctioneer pays an annual duty of £10 to government for his license, which must be renewed on the 5th July; though there are certain judicial sales which may be conducted by bailiffs without license. But the want of a license does not vitiate the sale. An additional license is required for the sale of excisable goods, but the ordinary license entitles an auctioneer to act also as appraiser. An auctioneer is generally paid by commission on proceeds after deduction of expenses, and this is due even where the owner makes a private sale after an unsuccessful exposure; for this commission the auctioneer has a lien upon the price and goods in his hands. The auctioneer is liable for negligence in the custody of goods sent to him for sale, but he is not liable for the price unless he has received it.

Aucuba, a genus of Cornaceæ (q.v.), of which the familiar, and probably the only true species is *A. japonica*, an evergreen shrub resembling a laurel, but, as seen in Europe, usually with pale green leaves curiously mottled with yellow. It is dioecious, and until recently the female plant was

alone in cultivation in Europe. The male, and also the normal green-leaved forms, have now been introduced, and many varieties are now grown. The scarlet berries are therefore becoming more frequently seen as pollination becomes possible.

Aucuba japonica.

The common form has long been largely cultivated as a hardy ornamental shrub, especially in the suburbs of large towns, a situation for which it is well adapted, as it is little liable to suffer injury from smoke. It is often known as the variegated laurel, but has of course no affinity with any of the other plants popularly confused under that name.

Aude (*Atax*), a river in the south of France, rises in the Eastern Pyrenees, not far from Mont Louis; flows for some time parallel to the canal of Languedoc; and falls into the Mediterranean 6 miles ENE. of Narbonne, after a course of 130 miles.

Aude, a maritime department in the south of France. It comprises some old 'counties' which formerly constituted a portion of the province of Languedoc. Area, 2438 sq. m.; pop. (1921) 287,052. The southern part is occupied by spurs of the Pyrenees, attaining 4037 feet in the Pay de Bugarach; but the greater portion belongs to the valley of the lower Aude, and is bounded to the north by offsets of the Cevennes (4018 feet). The coast is flat, with no bays or roadsteads, but several lagoons. The climate is warm, but variable. The mountains are composed of granite, while the soil of the plains is chiefly calcareous, and about the coast—where salt and soda are procured—is extremely fertile, producing cereals, olives, fruits, and wines. Aude is rich in iron and mineral springs, but the coal-mines have been generally abandoned. Wild animals are found, and game of all sorts is plentiful, while the coast abounds in fish. The woollen and silk manufactures are of considerable value. There is likewise a considerable export of cereals and of honey. The chief town is Carcassonne (q.v.).

Audebert, JEAN BAPTISTE, a French naturalist and artist, was born in 1759 at Rochefort, and at Paris attained eminence as a miniature-painter. In 1800 he published a splendid illustrated volume on the monkeys and lemurs, the *Histoire Naturelle des Singes*, a large folio, with coloured plates remarkable alike for their truth and beauty, and in whose production he introduced great improvements in the art of colour-printing in oil. He subsequently prepared a similar work on the

humming-birds (1802), and another on the birds of paradise (1803), which were both completed and published after his death in 1800.

Audh. See **ODUH**.

Audiometer is a special application of the Telephone (q.v.) for measuring minute differences in the power of hearing.

Audiphone is the name of an invention (1879) by Mr Rhodes of Chicago, to assist the hearing of deaf persons in whom the auditory nerve is not entirely destroyed. The instrument is made of a thin sheet of ebonite rubber or hard vulcanite. It is about the size of a palm-leaf fan, with a handle and strings attached to bend it into a curving form, and a small clamp for fixing the string at the handles. The audiphone is pressed by the deaf person using it against his upper front teeth, with the convex side outwards; when so placed it communicates the vibrations caused by musical sounds or articulate speech to the teeth and bones of the skull, and thence to the organs of hearing. For different sounds, it requires to be focused to different degrees of convexity. A simple strip of fine glazed millboard has been recommended by some experimenters as a cheaper and equally serviceable audiphone; and birch-wood veneer has been used with success for the same purpose.

Audita Querela is a form of action which lies for a defendant to recall or prevent an execution, who has grounds to show that such execution ought not to issue against him, or on account of some matter occurring after judgment amounting to a discharge, which could not have been and cannot be taken advantage of otherwise. It is a remedial process, equitable in its nature, based upon facts, and not upon the erroneous judgment or acts of the court, in which damages may be recovered if execution was improperly issued. In the United States, it has in some states been entirely superseded by relief granted upon motion, while in other states it is recognised by statute and of frequent use. The writ of Audita Querela does not lie against the government.

Auditor, the name given to those who are appointed to examine accounts on behalf either of the government, of courts of law, of corporations, or of private persons. An auditor is usually, but not always, a professional accountant. His duties are to see that all payments and receipts in the accounts submitted to him are instructed by vouchers, or otherwise proved, that the accounts and books are properly kept and stated, and either to certify their accuracy, or point out any error he may discover. All limited companies must have their accounts certified by an auditor appointed by the shareholders.

AUDITOR OF THE COURT, in Scotland, is an officer whose duties, like those of *taxing master* in England, consist of taxing the costs of suits in which expenses are found due, a remit being made to him for that purpose by the presiding judge.

AUDIT-OFFICE.—In 1785 public auditors were appointed under the title of 'Commissioners for Auditing the Public Accounts; and the patents of the two auditors of the imprests of the Admiralty were vacated, the sum of £7000 per annum being made payable to each of them for life. Many subsequent statutes have been passed for the purpose of extending and defining the duties of these commissioners, and regulating the business of the audit-office. In 1866 an act was passed 'to consolidate the powers and duties of the comptroller of Her Majesty's Exchequer and of the Commissioners for Auditing the Public Accounts, and to unite in one department the separate establishments under them.' That department now consists of a comp-

troller and auditor-general, an assistant comptroller and auditor, and a large staff of clerks. The Audit Department is empowered to call on all keepers of public accounts to account for moneys or stores entrusted to them, and examine the accounts of Army and Navy, of Land Revenue and the like.

See **ACCOUNTANT**; Dicksee's *Auditing* (9th ed. 1912); Pixley's *Auditors and their Duties* (9th ed. 1906); *A History of Accounting and Accountants*, by R. Brown and others (1905).

Audley, SIR JAMES, one of the original knights of the Order of the Garter, founded in 1344 by Edward III., in 1350 fought in the sea-fight of Sluys, and in 1354 attended Edward the Black Prince to France. He showed such bravery at the battle of Poitiers that the Prince declared him to be the bravest knight on his side, and conferred on him an annual revenue of 500 marks, which Audley immediately gave up to his four squires. Hearing of this act of generosity, the Prince conferred on him a further pension of 600 marks. Audley, in 1362, was governor of Aquitaine; in 1369, great seneschal of Poitou. He took part in the capture of La-Roche-sur-Yon in the same year, and died a few months after at Fontenay-le-Comte.

Audouin, JEAN VICTOR, naturalist, was born at Paris, 27th April 1797, and studied medicine and the natural sciences. Installed in 1833 as professor of Entomology at the Jardin des Plantes, he made special studies on the muscardine (a silkworm disease), the parasites infesting the vine, and other insect pests. He wrote on these (1842) and on the natural history of the French coasts (1830), and died 9th November 1841.

Audran, EDMOND (1842-1901), born at Lyons, composed vaudevilles and comic operas, the best known being *Le Grand Mogol* (1876), *La Mascotte* (1880), *La Cigale* (1890), and *La Poupée* (1896).

Audran, GÉRARD, French engraver, was born at Lyons in 1640, and after three years at Rome, where he acquired a high reputation by his engraving of Pope Clement IX., was recalled to France by Colbert, and appointed engraver to Louis XIV. Here he engraved the works of Lebrun, illustrating the battles of Alexander, and many paintings by Raphael, Titian, Domenichino, Poussin, and others. He died at Paris in 1703. His nephews, Benoît (1661-1721) and Jean (1667-1756), were also engravers.

Audubon, JOHN JAMES, American ornithologist, is said to have been born on his father's plantation, near New Orleans, 5th May 1780, but was probably born a year or two earlier. His father had been an officer in the French navy. His mother was a lady of Spanish extraction, who, after the birth of four children, accompanied her husband to St Domingo, and there perished in the great negro insurrection. Visiting France with his children, the elder Audubon soon married again, settled his family in the city of Nantes, and resumed his duties in the French navy; and it was chiefly through his stepmother's indulgence that young Audubon was enabled to gratify his taste as a naturalist. His father undertook to educate him for the army or navy; but music, drawing, and the collection of natural history specimens usurped the attention that should have been given to mathematics, until finally the lad was sent to America to occupy a property in Eastern Pennsylvania, which his father had previously purchased. Here he lived for some time a sort of Bohemian naturalist, and here he married in 1808 Miss Lucy Bakewell, the daughter of a farmer. Immediately after, he sold his land, bought a stock of goods, and, with his

wife and a French friend and partner, Rosier, migrated westward to engage in mercantile pursuits. A flat-bottomed boat conveyed the party down the Ohio from Pittsburg to Louisville, Kentucky, where they commenced trade, Audubon, however, spending his time principally away on expeditions with the neighbouring planters hunting birds, while Rosier 'stuck to the counter.' Business so conducted naturally proved unprofitable, and the firm removed first to Hendersonville, Kentucky, and next to St Genevieve, Missouri, where Audubon sold his interest to his partner and returned to Hendersonville. A succession of business misadventures speedily swept away all his funds, when, with 'his sick wife and his gun, his dog, and his drawings,' he returned to Louisville, and engaged in drawing portraits, whereby (here and subsequently in Cincinnati) he supported his family for a while in comfort. In 1820, however, he left Cincinnati, without a dollar, on an excursion down the Ohio and Mississippi rivers, stopping at the principal towns and drawing portraits, and adding at every available opportunity to his already wonderful collection of coloured designs of birds. He records that in one instance he executed portraits of a shoemaker and his wife in payment for two pairs of boots, one of which he gave to a destitute fellow-traveller, reserving the other pair for his scarcely less destitute self. After a precarious existence of this sort for some three years, Audubon visited the cities of the Atlantic coast with the view of publishing his works; but meeting with little encouragement, he returned to Louisiana, and taught classes in dancing. Encouraged and assisted by his wife, who was receiving nearly \$3000 a year as a teacher, he embarked for Europe in 1826, where he was received with great kindness by the leading scientists. Public exhibitions of his drawings in Liverpool and Edinburgh proved successful, and in 1827 he issued the prospectus of his great work, *The Birds of America*, to appear in numbers at two guineas each—each number to consist of five plates. He canvassed the British towns for subscribers, meanwhile painting and selling pictures to defray his current expenses, and in 1828 visited Paris, where his work received the highest encomiums—a report from Cuvier to the Paris Academy of Sciences declaring it 'the most magnificent monument which art has yet erected to nature.' The work embraces coloured figures of 1065 species of birds (natural size), the publication of which occupied some ten years, and is said to have cost £20,000 (\$100,000). In the meantime, Audubon visited America, and explored the least known regions of the Atlantic coast from Labrador to the Gulf of Mexico, returning to London, in the interest of his work, in 1837. In 1839 he settled with his family in New York city, visited the Yellowstone River in 1843, and subsequently, assisted by his sons, he published *The Quadrupeds of North America*, largely from materials prepared some years prior by himself and Dr John Bachman of South Carolina. He died 27th January 1851.

See a Life by Mrs Horace St John (1856); that by R. Buchanan from materials supplied by his widow (1869); but especially *Audubon and his Journals*, by his daughter, Maria R. Audubon (2 vols. 1898).

Auenbrugger von Auenbrug, LEOPOLD, an Austrian physician, born at Gratz in 1722, practised at the Spanish hospital in Vienna, where he died in 1809. As early as 1754 he had discovered the method of investigating internal diseases which afterwards made him famous; but not until after seven years of experiments and verification did he publish his treatise, entitled *Inventum novum ex percussione thoracis humani*

interni pectoris morbos detegendi (Vienna, 1761). See PERCUSSION.

Auerbach, BERTHOLD, German novelist, was born, of Jewish parentage, at Nordstetten, in the Wurtemberg Black Forest, 28th February 1812. He received his education at the Talmud school of Hechingen, at Carlsruhe, at Stuttgart gymnasium, and at the universities of Tübingen, Munich, and Heidelberg, in 1836 suffering several months' imprisonment in the fortress of Hohenasperg as a member of the students' Burschenschaft. He had been destined for the synagogue, but had early abandoned theology for law, then law for history and philosophy—the philosophy, above all, of the great thinker of his race, Spinoza. A biographical romance, based on Spinoza's life, succeeded in 1837 his earliest work, *Das Judentum und die neueste Literatur* (1836), and itself was followed by a translation of Spinoza's works (5 vols. 1841). In the first series of his *Schwarzwalder Dorfgeschichten* (1843), on which his fame chiefly rests, he gives charming pictures of Black Forest life, though his peasants too often are peasant Spinozas. The longer stories—*Barfussle* (1856), *Joseph im Schnee* (1861), and *Edelweiss* (1861)—are good, but not so good; and the three-volume didactic romances of the third and last period of his literary career, though clever of course, are tedious to a degree. These were *Auf der Höhe* (1865), *Das Landhaus am Rhein* (1869), *Waldfried* (1874), &c. —'philosophical novels, in which,' in his own words, he 'undertook to treat problems of speculative ethics, and dealt not so much with events and actual conflicts in life as with conversations and the unfolding of definite objects of thought.' Many of Auerbach's works, which in German fill nearly 40 volumes, have been translated, not over well, into English. After a restless life, passed at Frankfort, Vienna, Dresden, Berlin, &c., he died at Cannes, 8th February 1882. See books on him by Eduard Lasker (1882) and Bettelheim (1904), and two volumes of his Correspondence (1884).

Auersperg, ANTON ALEXANDER, GRAF VON, German poet, was born at Laibach, April 11, 1806. Descended from an ancient Swabian family which, in the 11th century, had settled and acquired large estates in Carniola, he took a prominent position in the diet of that province (1861-67). In 1861 he was chosen a life-member of the upper house of the Austrian Reichsrath; and he died at Gratz, 12th September 1876. He was always distinguished by his Liberalism and his ultra-German sympathies: but he is best known, under the *nom de guerre* of Anastasius Grün, as one of the German epic and lyrical poets, among whom he holds a high rank, excelling most in humorous subjects and political satires. His collected works fill 7 vols. (1877). See the Life of him by Radicz (2 vols. 1876-78).

Auerstädt, a village in the Prussian province of Saxony, 10 miles W. of Naumburg. It is famous for the great battle which took place there, October 14, 1806, between the French under Davoust, and the Prussian army under Duke Charles of Brunswick, which ended in a great victory for the former. The Prussians, who numbered fully 48,000, left nearly half their men, dead or wounded, on the ground, while the French (30,000) escaped with a loss of only 7000. Napoleon, who had, on the same day, defeated the main army of Frederick-William III. at Jena (q.v.), made Davoust Duke of Auerstädt.

Aufrecht, THEODOR, philologist, born 7th January 1822 at Leschnitz in Upper Silesia. After studying at Berlin under Bopp, Bockh, and Lachmann, he settled there in 1850, and devoted himself to Sanskrit and the old German tongues. To this time of his life also belongs

his collaboration with Kirchhoff in the publication of *Umbrische Sprachdenkmäler* (2 vols. Berlin, 1849-51), an epoch-making work in the comparative study of the languages of ancient Italy; as well as the founding of the well-known *Zeitschrift für vergleichende Sprachforschung* (1852), in the editing of which he assisted A. Kuhn for some time. In 1852 he repaired to Oxford, where he helped Max Müller in his edition of the *Rigveda*, and was appointed to a place in the Bodleian Library, the fruit of which was his excellent *Catalogus codicum Sanscritorum bibliothecae Bodleianae Oxoniensis* (1864). In 1862 he became professor of Sanskrit and Comparative Philology at Edinburgh, and in 1875 resigned this chair for one at Bonn, which he resigned in 1889. He died in May 1907. We owe to him scholarly editions of several classical Sanskrit works, the most important his *Rigveda* (2nd ed. 1877).

Auge'as, or **AUGEIAS**, son of Phorbas or of Helios (the sun), king of the Epeans in Elis. He had 3000 head of oxen in his stables, which had not been cleaned out for thirty years. Hercules was commissioned by Eurystheus to cleanse the Augean stables in one day, and was promised as payment a tenth part of the oxen. He accomplished the task by turning the courses of the rivers Peneus and Alpheus through the stables. Augeas now refused to pay the stipulated wages, whereupon Hercules killed him.

Augereau, **PIERRE FRANÇOIS CHARLES**, Duke of Castiglione, marshal and peer of France, one of the most brilliant and intrepid of that band of general officers whom Napoleon gathered around himself, was the son of a Paris fruiterer, and was born in 1757. After serving in the French and Neapolitan armies, he settled in Naples as a fencing-master in 1787. In 1792 he volunteered into the French revolutionary army, and in less than three years was made a general of division. In 1795 he accompanied the army to Italy, where he greatly distinguished himself, gaining glory in the battles of Lodi, Castiglione (in 1796, from which he afterwards received his title), and Roveredo. At Paris, in 1797, he carried through the *coup d'état* of the 4th September, and he soon became a supporter of Napoleon. In 1801 he received the command of the army in Holland. In 1804 he was made a marshal; commanded a wing at Jena and at Eylau; was governor at Berlin, and fought at Leipzig in 1813. He died in 1816.

Aughrim. See **AGHRIM**.

Augier, **GUILLAUME VICTOR ÉMILE**, a French dramatist, was born at Valence, September 17, 1820, and was educated as a lawyer. In 1844 he composed a drama in verse, *La Cigüe*, which was played at the Odéon with success. Other dramas in verse are *Gabrielle* (1849), *Diane* (1852), *La Jeunesse* (1858), and *Paul Forestier* (1868). Originally criticised as a leader of the 'school of good sense,' he ultimately dealt unsparingly with the vicious tendencies of modern life, though never forsaking the idealist standpoint. His later dramas are mostly in prose, and may be said to belong to the comedy of intrigue. Notable works are *Le Mariage d'Olympe* (1855); *Le Gendre de M. Poirier* (1854), written in partnership with Jules Sandeau; *Les Lionnes Pauvres* (1858); *Les Effrontés* (1861); *Le Fils de Gaby* (1862); *Maitre Guérin* (1869); *Les Fourchambault* (1874). In 1858 he became a member of the Academy, and in 1868 Commander of the Legion of Honour. He died 28th October 1889. His *Théâtre complet* fills 7 vols. (1876-90).

See monographs by Pailleron (1889), Parigot (1890), Morillot (1901), and H. Gaillard de Champris, *Émile Augier et la Comédie Sociale* (1910).

Augite (Gr. *augē*, 'brilliancy'), one of the

Pyroxene group of minerals, is very nearly allied to Hornblende (q.v.). Augite consists of 47-56 per cent. of silica, 20-25 per cent. of lime, and 12-19 per cent. of magnesia, the magnesia sometimes giving place in whole or in part to protoxide of iron, and some varieties containing a little alumina, or a little protoxide of manganese. Its specific gravity is 3.195-3.525. It is little affected by acids, or not at all. It is usually of a greenish colour, often nearly black. It crystallises in six or eight-sided prisms, variously modified. It is an essential com-

a, Common Augite; *b*, Green Augite.

ponent of several igneous rocks, particularly of Basalt (q.v.) and its varieties, and it occurs as an accessory constituent in a great many more. It is, in fact, as a rock-constituent that augite derives its importance as a mineral species. It is rarely associated with quartz, in which respect it differs from hornblende, but very often with labradorite, olivine, nepheline, and leucite. Fluorine, which is generally present in small quantity in hornblende, has never been detected in augite. The form of the crystals is also different in the two minerals, as well as their cleavage. In augite the cleavage-planes intersect nearly at right angles; in hornblende the angles are $124^{\circ} 30'$ and $55^{\circ} 30'$. Rose of Berlin endeavoured to show that the difference between augite and hornblende arises only from the different circumstances in which crystallisation has taken place, and that augite is the production of a comparatively rapid, and hornblende of a comparatively slow, cooling. His views have been supported by experiments, and by a comparison of augite with certain crystalline substances occurring among the scoriae of foundries.—*Diopside*, *Sahtite*, and *Coccolite* are varieties of augite.—*Diallage* (q.v.) and *Hypersthene* (q.v.) are very nearly allied to it.

Augium, the Latin name of Eu (q.v.).

Augment, in Indo-Germanic grammar, a vowel prefixed to the historic tenses in the indicative mood. It survived in Sanskrit as *a-*, and in Greek as *e-*, which contracted with a following vowel.

Augmentation, in Heraldry, an additional charge in a coat-of-arms bestowed by the sovereign as a mark of honour. Augmentations have generally been granted to be borne on a canton, on an escutcheon *en surmont*, or on a chief. The bearings on the chiefs of augmentation bestowed on the military and naval heroes of England in the beginning of the nineteenth century are for the most part so confused and unarmorial that an intelligible description of them can scarcely be given in heraldic language.

Augmentation, in Music, is the reproduction of a melody, or principal subject of a composition, in the course of the progress of the piece, in notes of greater length than those notes in which the melody is first introduced. The tempo remains unaltered. Augmentation is of great importance in the treatment of the subjects, or themes, for fugues, and when cleverly used produces great effects.

Augmentation, PROCESS OF, in Scots law, an

action in the Court of Teinds (q.v.) by the minister of a parish against the titular or person entitled to the free teinds, and the heritors, i.e. the landowners, for the purpose of procuring an increase to his stipend. The moderator and clerk of the presbytery to which the minister belongs must also be called as parties. A period of twenty years must elapse before the minister becomes entitled to a fresh augmentation. There must of course be some free teind in the parish—i.e. teind not previously applied to stipend—otherwise there can be no augmentation. In many parishes the teinds are exhausted. The amount of the augmentation is fixed, or modified, as it is termed, in so many chalders of grain or victual, generally Linlithgow measure of oatmeal and barley: the stipend itself being paid in money, according to the Fiars Prices (q.v.) of each year. In the modification of a suitable stipend, regard is had to the state of the teinds, the extent of the parish, the population to be cared for, the expense of living, and the like; but a general cause, such as the Repeal of the Corn Laws, was not held to justify an augmentation. This process has the further object in view of *localising* the stipend so modified—i.e. of assigning it in due proportions to the heritors or other parties in possession of the teinds. This object is attained by means of what is called a scheme of locality—an allotment of the stipend modified to the several parties liable therefor. This scheme is prepared at the instance of the second junior Lord Ordinary, on a remit from the Teind Court. The last conclusion in a summons of augmentation is for a suitable sum, or increase to the sum already allowed, for communion elements—i.e. for bread, wine, and other necessities for celebrating the sacrament of the Lord's Supper after the Presbyterian fashion. When the population of a parish does not exceed 2000, the court will not allow more than £10 for communion elements; but in the case of large town parishes, greater sums are allowed. When there is not sufficient teind to bring the stipend up to £150, with £8, 6s. 8d. for communion elements, the deficiency was formerly paid by the Exchequer; but this fund is now exhausted. Much discontent is felt with the tedious and expensive nature of augmentations, especially where in an urban parish the stipend has to be allocated over a great number of small rentals. Litigation frequently occurs as to the rights held to teinds, and the validity of the valuations of teinds made early in the 17th century.

AUGMENTATION OF BENEFICES is an important form of church extension in England. Much of the Queen Anne's Bounty is applied to this purpose, and under the Lord Chancellor's Act of 1863 nearly a quarter of a million sterling, realised by the sale of certain classes of advowson, has been similarly applied. See **STIPEND**, **GLEBE**; also **PARISH**, **QUEEN ANNE'S BOUNTY**.

Augsburg, an historic city of Bavaria, capital of the province of Swabia, is situated in the angle between the rivers Wertach and Lech, 37 miles WNW. of Munich. Though presenting an antique and rather deserted appearance, Augsburg has numerous fine buildings, and one noble street, the Maximilian Strasse, adorned with three bronze fountains (1593-1602). The principal edifices are the Renaissance town-house (1620), with its splendid 'Golden Hall'; the Perlach Tower, dating from the 11th century; the former episcopal palace, where, on 25th June 1530, the Protestant princes presented the Augsburg Confession to Charles V.; the grand old mansion of the Fuggers; the 'Three Moors,' one of the most interesting hostels in Germany; and the Gothicised Romanesque cathedral (994-1421), with its bronze doors and early glass-paintings. The old fortifications have been turned into pro-

menades. The industry of Augsburg is once more vigorous. Cotton is now the staple manufacture; and there are also large factories for linens, woollens, paper, tobacco, and machinery, as well as foundries, breweries, dye-works, and chemical-works. The gold and silver wares retain their ancient reputation; and painting, lithography, and bookbinding have taken a new start, though the well known *Allgemeine Zeitung* (1798) was in 1882 transferred to Munich. Banking and stock-jobbing are extensively carried on; and Augsburg is still the emporium of the trade with Italy and southern Germany, being the centre of a system of railways that connect it with Nuremberg, Leipzig, Switzerland, Munich, &c. Pop. (1871) 51,270; (1919) 154,567, two-thirds Roman Catholics.

The foundation of Augsburg was the 'colony' planted by the Emperor Augustus, 12 B.C., after the conquest of the Vindelici, probably on the site of a former city of that people. It was called *Augusta Vindelicorum*, and hence the present name. It became the capital of the province of Rætia, was laid waste by the Huns in the 5th century, and came next under the dominion of the Frankish kings. In the war of Charlemagne with Thassilo of Bavaria, it was again destroyed (788). After the division of Charlemagne's empire, it came under the Duke of Swabia; but having become already rich by commerce, was able to purchase gradually many privileges, and finally became in 1276 a free city of the empire. It now rose to greater consequence than ever, and had reached the summit of its prosperity by the latter half of the 14th century. In 1368 its aristocratic government was set aside for a democratic, which lasted till 1548, when the aristocracy, favoured by Charles V., regained the ascendancy. Augsburg continued in great eminence for its commerce, manufactures, and art, till the war between Charles V. and the Protestant league of Schmalkald (1540). Along with Nuremberg it formed the emporium of the trade between Northern Europe and the south, and its merchants were princes whose ships were in all seas (see **FUGGER**). It was also the centre of German art as represented by the Holbeins, Burgkmair, Altdorfer, and others. Many diets of the empire were held in Augsburg, and the leading events of the Reformation are associated with its name, as the Diet of Augsburg (1530), the Interim of Augsburg (1548), and the 'Religious Peace' of Augsburg (1555) by which the Protestants secured the full enjoyment of their rights and privileges (see **REFORMATION**). The discovery of the road to India by the Cape, and of America, turned the commerce of the world into new channels, and dried up the sources of Augsburg's prosperity. It ceased to be a free city on the abolition of the German empire in 1806, and was taken possession of by Bavaria.

Augsburg Confession, the chief standard of faith in the Lutheran Church. With a view to an amicable arrangement of the religious split that had existed in Germany since 1517, Charles V., as protector of the church, had convoked a diet of the empire, to meet at Augsburg, 8th April 1530, and had required from the Protestants a short statement of the doctrines in which they departed from the Catholic Church. In March, therefore, the Elector, John of Saxony, called on his Wittenberg theologians, with Luther at their head, to draw up articles of faith, to lay before him at Torgau. The commissioned doctors took as a basis, in so far as pure doctrine was concerned, articles that had been agreed to the previous year at conferences held at Marburg and Schwabach, in the form of resolutions of the Lutheran reformers of Germany against the doctrines of Zwingli. These doctrinal articles, supplemented, and with a practical part newly added, were laid before the

Elector at Torgau. Melancthon then, taking as a foundation the Torgau articles, began at Augsburg in May, and, with the advice of various Protestant theologians, as well as princes and other secular authorities, composed the document which he first called an Apology, but which in the diet itself took the name of the Augsburg Confession. Luther was not present in Augsburg, being then under the ban of the empire, but his advice was had recourse to in its composition. The Torgau articles were in German; the Confession was both in German and Latin; and Melancthon laboured incessantly at its improvement till it was presented to the emperor, June 25. In composing the document, Melancthon sought to maintain a spirit of forbearance and conciliation, as well as to secure the utmost brevity and simplicity. The aim of the Confession was to give a collected view of the belief of the Lutheran Protestants, to lay a foundation for measures of reconciliation. The Protestant doctrines were stated in a form as near that of the Catholic views as possible, and their agreement with the church fathers carefully emphasised.

The first part of the Confession contains twenty-one articles of faith and doctrine: 1. Of God; 2. Of Original Sin; 3. Of the Son of God; 4. Of Justification; 5. Of Preaching; 6. Of New Obedience; 7 and 8. Of the Church; 9. Of Baptism; 10. Of the Lord's Supper; 11. Of Confession; 12. Of Penance; 13. Of the Use of Sacraments; 14. Of Church Government; 15. Of Church Order; 16. Of Secular Government; 17. Of Christ's Second Coming to Judgment; 18. Of Free Will; 19. Of the Cause of Sin; 20. Of Faith and Good Works; 21. Of the Worship of Saints. The second and more practical part, which is carried out at greater length, contains seven articles on disputed points: 22. On the Sacrament in Two Kinds; 23. Of the Marriage of Priests; 24. Of the Mass; 25. Of Confession; 26. Of Distinctions of Meat; 27. Of Conventual Vows; 28. Of the Authority of Bishops.

This document, signed by seven Protestant princes and two free cities, was read before the emperor and the diet, 25th June 1530. Melancthon, not looking upon the Confession as binding, began shortly after to make some alterations in its expression; at last, in 1540, he published a Latin edition (*Confessio Variata*) in which there were important changes and additions. This was especially the case with the article on the Lord's Supper, in which, with a view to conciliation, he endeavoured to unite the views of the Lutherans and Calvinists. This gave rise subsequently to much controversy; orthodox Lutheranism repudiated the alterations of Melancthon, and long continued to subject his memory to great abuse; though it is clear that Melancthon and his adherents contemplated no substantial departure in doctrine from the original Confession. It is not certain that the form of the Confession found in the Lutheran standards is identical with the unaltered Augsburg Confession, as the two original documents—German and Latin—laid before the diet have been lost. The chief distinction between the orthodox Lutherans and the reformed churches of Germany has all along been adherence to the 'unaltered' or to the 'altered' Confession. It was even a matter of controversy whether the 'reformed' were entitled to the rights secured to the Protestants by the Religious Peace of Augsburg, concluded in 1555, on the ground of the 'unaltered' Confession; and few modern German Protestants, save a minority of the 'Confessional' Lutherans, would claim it as a statement of their faith.

There are books on the 'Augustana' by Rudelbach (1841), Plitt (1868), Zoekler (1870), and Kolde (1896); and see the article in the Hauck-Herzog *Enzyklopädie* (1896-1910) and Kostlin's *Life of Luther*.

Augsburg Interim. See INTERIM.

Auguries and Auspices, the observation and interpretation of omens as a means of obtaining knowledge of secret or future things. The general doctrine of the interpretation of divine revelation is called *Divination* (q.v.), and this more general term includes both *artificial* divination by prodigies, lightning, astrology, lots, observation of the flight or feeding of birds, and the appearance of the entrails of animals or haruspication, as well as *natural* divination through dreams and prophetic oracles. There was no natural divination among the Romans—they had not conceived, like the Greeks, that notion of inward inspiration and insight, by which a human soul is enlightened by a fateful intuition and made to participate for an instant in the divine omniscience. The supernatural faculty is confined to the gods themselves, and they speak directly to men through the passive organs of animals. From the very dawn of Roman history divination is a kind of political institution. It does not develop the curiosity of the mystic; it reduces revelation to nothing more than simply information on the actual dispositions of the gods, only touching indirectly the past and the future. It only asks one problem—to know if the gods encourage or not the design about which they are consulted; it awaits the reply from Jupiter himself, and forbids the inquiry to be made otherwise than through certain conventional signs. The augural art does not go further than this. If in certain grave conjunctions it was found insufficient, the Romans preferred to consult the Etruscan *haruspices* or the Hellenic oracles rather than to add anything to their traditional customs.

The two Latin words *augur* (*avis*, 'a bird,' and a root allied to Sanskrit root *gar*, 'to call') and *auspex* (for *avispez*, from *avis*, 'a bird,' and *spicio*, 'I see') differed originally as a general idea from a particular one, since the latter observed only the flight of birds. Yet as this latter kind of augury was the most common, the two words are frequently interchanged or employed in connection. Neither vaticination or direct revelation, nor the interpretation of fortuitous presages, was so much esteemed by the Romans as the observation of birds. It was the function of the augurs to make these observations and explain their significance. It was not, however, any one who could be appointed an augur. The gods selected their own interpreters—that is to say, they conferred the divine gift upon them from their very birth; but an educational discipline was also considered necessary, and hence a 'college of augurs' figures in the very dawn of Roman history. Romulus himself is represented in legend as an augur. Previous to the Ogulnian law, passed in the year 307 B.C., there were only four augurs, who were selected from the patricians. By this law, however, the plebeians became eligible for the pontifical or augural offices, and five were immediately created. For more than two hundred years the number continued the same, till Sulla in 81 B.C. increased it to fifteen. Finally, in the first days of the Empire, when all parties, sick of the long civil wars, hurried to throw their privileges at the feet of the monarch who had brought peace into their homes, the right of electing augurs at his pleasure was conferred on Augustus, after which the number became indefinite.

At first, the augurs were elected by the *Comitia Curiata*; but as the sanction of the former was necessary to give validity to the acts of the latter, they could always veto any elections which were obnoxious to them; so that the power of electing members to fill up vacancies naturally fell into the hands of the college itself, and so continued till 103 B.C., when a tribune of the people named Ahenobarbus carried a law by which it was enacted that

for the future, vacancies in the augural and pontifical offices should not be filled up by those religious corporations themselves, but by a majority of certain selected tribes. This new law was occasionally repealed and re-enacted during the civil wars which lasted till the time of Augustus. The scramble for power, however, during these political vicissitudes, as well as the general advance of knowledge, had rendered the prophetic pretensions of the augur's office ridiculous in the eyes of educated people. By Cicero's time it had lost its religious character altogether, but was still regarded as one of the highest political dignities, and coveted for the power it conferred.

The modes of divination employed by the augurs were five in number—*augurum ex celo, ex avibus, ex tripudiis, ex quadrupedibus, ex diris*. The first related to the interpretation of the celestial phenomena, such as thunder and lightning, was apparently of Etruscan origin, and was held to be of supreme significance. The second related to the interpretation of the noise and flight of birds. It was not every bird, however, that could be a sure messenger of the gods. Generally speaking, those 'consulted' were the eagle, vulture, crow, raven, owl, and hen. The first two belonged to the class of *alites*, or birds whose flight revealed the will of the gods; the last four to the class of *oscines*, whose voice divulged the same. These two modes of augury were the oldest and most important. Of the other three, the auguries *ex tripudiis* were taken from the feeding of chickens; the auguries *ex quadrupedibus*, from four-footed animals—as, for instance, if a dog, or wolf, or hare ran across the path of a Roman, and startled him by any unusual motion, he mentioned it to an augur, who was expected to be able to advise him what to do; the auguries *ex diris* (a vague kind of augury), from any trifling accidents or occurrences not included in the previous four—such as sneezing, stumbling, spilling salt on the table, and the like.

At Rome, the auspices were taken on the summit of the Capitoline Hill; and the ground on which the augur stood was first solemnly set apart for the purpose. He next took a wand, and marked out a portion of the heavens in which his observations were to be made. This imaginary portion was called a *templum* (hence *contemplari*, 'to contemplate'), and was subdivided into right and left. According as the birds appeared in either of these divisions were the auspices favourable or unfavourable. How vast the political influence and authority of the augurs must have been is seen from the fact that almost nothing of any consequence could take place without their sanction and approval. The election of every important ruler, king, consul, dictator, or prætor, every civic officer, every religious functionary, was invalid, if the auspices were unfavourable. No general could lawfully engage in battle—no public land could be allotted—no marriage or adoption, at least among the patricians, was held valid—unless the auspices were first taken, while the Comitia of the Centuries could be dispersed at a moment's notice by the veto of any member of the augural college.

Not the augurs alone, but the chief magistrates of Rome (inheriting the honour from Romulus), held the 'auspices,' while the 'auguries' were exclusively in the possession of the former. The power of taking the auspices in war was confined to the commander-in-chief; a victory gained by a legate was won under the auspices of his superior—hence our loose use of the phrase. Cato's remark about Haruspices (q.v.) quoted by Cicero—a member of the College of Augurs—is commonly but erroneously made to refer to augurs. Auguries were eclipsed in the classical period by the inspection of entrails—probably a sub-rite of sacrifice.

It must not be supposed that it was among the Romans alone that augury was practised. It is well known in the folklore of every race, and there are few English peasants to whom the magpie and cuckoo are not still significant. Dr Tylor quotes in his *Primitive Culture* many instances which show that it has always been and is still part of the doctrine of the savage in whatever quarter of the globe he is found. It is familiar to the Tupis of Brazil and the Dyaks of Borneo. The Maoris think it unlucky if an owl hoots during a consultation, but are encouraged if a hawk flies overhead; a flight of birds to the right of the war-sacrifice is propitious if the villages of the tribe are in that quarter, but if the omen is in the enemies' direction the war will be given up. The Kalmuck is happy when a white owl flies by on the right, but expects calamity when he sees one on the left; and to the negro of Old Calabar the direction in which he hears the cry of the great kingfisher has exactly the same significance. Haruspication also is practised by the Malays and Polynesians and by various Asiatic tribes. It was practised in Peru under the Incas, and Sir Richard Burton's account of it in Central Africa shows it closely to resemble that in use among the civilised Romans.

See Bouché-Leclercq, *La Divination dans l'Antiquité* (1880-82), and Hallday's *Greek Divination* (1913).

August, the sixth month in the Roman year, which began with March, was originally styled *Sextilis*, and received its present name in honour of the Emperor Augustus, several of the most fortunate events of his life having occurred during this month. In this month he was first admitted to the consulate, and thrice entered the city in triumph. In the same month, the legions from the Janiculum placed themselves under his auspices, Egypt was brought under the authority of the Roman people, and an end put to the civil wars. To make it equal with the fifth month, whose name had been changed from *Quintilis* to *Julius* in honour of Julius Cæsar, a day was taken from February and added to August.

Augusta, or AGOSTA, a fortified city of Sicily, 19 miles N. of Syracuse by rail. It stands on a rocky islet joined by a bridge to a peninsula projecting into the Mediterranean, and is near the site of the *Megara Hyblæa* of the ancients. The port is spacious, but of rather difficult access. Salt, oil, wine, cheese, fruit, honey, grain, and sardines are exported. Pop. 15,000. The town often suffered during the wars of the middle ages, and was in great part destroyed by earthquakes in 1693 and in 1848. Near it was fought in 1676 a great naval battle between the French under Duquesne, and a Spanish and Dutch fleet under the famous admiral De Ruyter. The latter was defeated, and received a wound of which he died at Syracuse.

Augusta, the capital of Maine, U.S., on the Kennebec, 63 miles NNE. of Portland by rail. It stands at the head of regular navigation, but small steamers run 18 miles higher. A dam, 17 feet high, affords considerable water-power, which is rendered available by a canal along the west bank, on which side the city is principally built. There are several cotton, pulp, paper, and other mills. Besides the state-house and other administrative buildings, Augusta contains a U.S. arsenal, state library, and insane asylum; and at Togus, 4 miles distant, is situated one of the national institutions for disabled soldiers, with accommodation for 1350 persons. Pop. 14,000.

Augusta, the second city of Georgia, U.S., is situated on the Savannah River, 231 miles from its mouth, but only 132 miles from Savannah by rail. It is the head of steamboat navigation on the river, which is here spanned by three bridges,

connecting the town with Hamburg, S.C., and which is crossed by a stone dam, 1720 feet in length, from which a canal, 8 miles long and 150 feet wide, supplies water both for domestic use and for the mills. The water-power is copious and the industries extensive, there being numerous cotton-mills, also large chemical, flour, and other works. There is a very large shipping trade in cotton. Augusta is the seat of the Medical College of Georgia (1832), and contains several other handsome public buildings, the city being generally well and regularly built. Pop. (1860) 12,493; (1920) 52,548.

Augustenburg, a village on a bay of the island of Alsen (q.v.). Its castle (1776) was formerly the residence of the Dukes of Holstein-Sonderburg-Augustenburg.

Augusti, JOHANN CHRISTIAN WILHELM, a learned German theologian, born in 1772 near Gotha. He studied at Jena, and successively filled there the chairs of Philosophy and of Oriental Languages. But in 1812 he accepted a theological professorship in Breslau, and in 1819 one at Bonn. He died in 1841. In the early part of his career, Augusti was a decided rationalist; but subsequently he returned to orthodox Lutheranism. His writings, marked by great learning, industry, and spirit, comprise works in the history of Christian dogma and an introduction to the Old Testament; but the most valuable is his manual of Christian Archaeology (Leip. 3 vols. 1836-37).

Augustine, ST (AURELIUS AUGUSTINUS), the greatest of the Latin fathers, was born at Tagaste, a town of Numidia, on the 13th of November 354 A.D. His father, Patricius, was poor, but of good family, and filled the office of magistrate. He continued a pagan till advanced in years, and was only baptised shortly before his death. He does not seem to have been remarkable for any elevation of mind; on the contrary, one may fairly conclude, from his son's statements, that he was an irascible, kind-hearted man, more intent on his son's advancement in this world than in that which is to come. Patricius was very anxious that Augustine should become a fine scholar, as he noticed that not a few people in his day were obtaining large incomes by their 'wits.' Augustine was accordingly sent to school at Madaura, and subsequently to Carthage, to complete his studies. Previous to this, however, he had enjoyed the inestimable felicity of a religious education at home. His godly mother, Monica, had been his best instructor. Neander truly says: 'Whatever treasures of virtue and worth the life of faith, even of a soul not trained by scientific culture, can bestow, were set before him in the example of his pious mother.'

The energy and penetration of intellect exhibited by the young Augustine excited the most flattering hopes. When he left home for Carthage, a joyous, ardent, and resolute student, a bright career of worldly prosperity seemed to open before him. But strong as Augustine was, the temptations of Carthage were stronger. His nature, deep, impetuous, and passionate, thirsted for excitement. He had just reached the age when pleasure is conceived to be synonymous with happiness, and Carthage, the second city of the empire, was rank as Rome in its sensual corruptions. Augustine fell. In his *Confessions* he paints the frightful abyss into which he felt himself plunged; nor does he seek to excuse himself; on the contrary, the shadow of his guilt is thrown forward over all his boyish life, and he displays even a morbid zeal and acuteness in pointing out what others, less censorious, might term the frivolous errors of his childhood, but which seemed to Augustine the parents of his subsequent vices, and therefore equally bad and equally reprehensible. Before he had reached

his eighteenth year, his mistress bore him a son, who was named Adeodatus—afterwards baptised along with him at Milan. The thing which appears to have first stirred his deeper being into life was a passage which he suddenly came across in the *Hortensius* of Cicero, treating of the worth and dignity of philosophy. Fascinated by 'the delusive pretensions of the Manichean sect, which, instead of a blind belief on authority held out the promise of clear knowledge and a satisfactory solution of all questions relating to things human and divine,' Augustine now became a professed Manichean. Returning to his native town, he lectured for a short time on 'grammar'—that is to say, on literature. Soon afterwards, he returned to Carthage, to pursue his profession under more favourable auspices. Here he wrote, in his twenty-seventh year, his first work, *De Apto et Pulchro*—a treatise on æsthetics, which has unfortunately been lost. About the same time his spiritual nature became keener and more imperative in its demands. The futile speculations of the visionary sect to which he had attached himself now became apparent. He had a series of interviews and conversations with Faustus, one of the most celebrated teachers of Manichæism; and these so utterly disappointed his expectations, that he left the society in disgust and sad bewilderment, after having wasted ten years in a fruitless search for wisdom and truth.

In 383 he went to Rome, followed by the tears, the prayers, and the anxieties of his excellent mother, who was not, however, bereaved of hope, for both her faith and her love were strong. After a short stay, Augustine left Rome, and proceeded to Milan, where he became a teacher of rhetoric. No change could have been more fortunate. At this time the Bishop of Milan was the eloquent and devout St Ambrose. An intimacy sprang up between the two, and Augustine, who was at this time a zealous student of Plato, often went to hear his friend preach. He confesses that the Platonic writings 'enkindled in his mind an incredible ardour;' they awakened his deeper spiritual nature, which keenly upbraided him with his sins. Once more he studied the Bible, wishing to find in it 'those truths which he had already made himself acquainted with from the Platonic philosophy, but presented in a different form.' He began to think that Christ and Paul, by their glorious life and death, their divine morality, their great holiness, and manifold virtues, must have enjoyed much of that 'highest wisdom' which the philosophers thought confined to themselves. For some time he clung to his Platonic Christianity, and shaped the doctrines of the Bible according to it; but when he found that it was weak to overcome temptations, and that 'he himself was continually borne down by the ungody impulses which he thought he had already subdued,' the necessity of a living personal God and Saviour to rescue him from the condemnation of his own conscience, and impart a sanctifying vitality to the abstract truths which he worshipped, shone clear through all the stormy struggles of his heart. In the eighth and ninth books of his *Confessions* he has left a noble though painful picture of his inward life during this momentous crisis. It is sufficient to say that the Spirit of God triumphed. On the 25th of April 387 A.D., Augustine, along with his natural son Adeodatus, was baptised by Ambrose at Milan. Shortly after, he set out on his return home. At Ostia, on the Tiber, his beloved mother, who had followed him to Milan, died; her eyes had seen the salvation of her son, and she could depart in peace. After her death, and before leaving Italy for Africa, Augustine wrote his treatises, *De Moribus*

Ecclesiae Catholicae et de Moribus Manichaeorum; *De Quantitate Animae*; and *De Libero Arbitrio*. His character and principles of action had become fixed, and he now brought the whole majesty of his intellect to bear upon the side of Christianity. Having, as was then customary for converts, divided his goods among the poor, he retired into private life, and composed several treatises—*De Genesi contra Manichaeos*, *De Musica*, *De Magistro*, and *De Verâ Religione*, which secured him a high reputation. In 391 he was ordained a priest by Valerius, Bishop of Hippo in Numidia; and during the next four years, though earnestly engaged in the work of preaching, contrived to write three different works. In 395 he was made colleague of Valerius. Then ensued a period of hot strife, known in church history as the Donatist and Pelagian controversies. Augustine, as may naturally be supposed, having passed through so fierce a fire of personal experience on religious questions, would be very jealous both of what he *knew* to be the truth, and of what he only *thought* to be the truth. This, added to his acute and profound intellect, made him, in spite of the poverty of his historical erudition, a most formidable and relentless antagonist. But this portion of his career will fall to be treated more properly under PELAGIUS and DONATISTS (q.v.). In 397 appeared his *Confessiones*, in 13 books. It is a deep, earnest, and sacred autobiography of one of the greatest intellects the world has seen. Passages of it have no parallel except in the Psalms of David. In 413 he commenced his *De Civitate Dei*, and finished it in 426. It is generally considered his most powerful work. Intended to be a great vindication of the Christian church, conceived of as a new order rising on the ruins of the old Roman empire, it is not only the grandest and most philosophical of the earlier monuments of Christian theology, but one of the most profound and lasting monuments of human genius. Yet exception may be taken to much that it contains. The learning is no doubt very considerable, but it is not accurate. Augustine was an indifferent scholar; he had studied the Latin authors well; but of Greek 'he knew little, and of Hebrew, nothing,' consequently many of his reasonings are based on false and untenable premises, and he errs often in his etymological explanations. In 428 Augustine published his *Retractationes*, in which he makes a recension of all his previous writings. It is a work of great candour. He frankly acknowledges such errors and mistakes as he had discovered himself to have committed, explains and modifies numerous statements, and modestly reviews his whole opinions. His end was now drawing nigh. In 429 the Vandals, under the barbarian Genseric, landed in Africa; next year they besieged Hippo. Augustine, now in his seventy-sixth year, prayed that God would help his unhappy church, and grant himself a release out of this present evil world. He died on the 28th of August 430, in the third month of the siege.

No mind has exerted greater influence on the church than that of Augustine. 'No controversy of his age was settled without his voice, and in his Letters (which fill a whole volume of the Benedictine edition of his works) we see the vastness of his empire, the variety of subjects on which appeal was made to him, and the deference with which his judgment was received.' Consistency of theological opinion is not to be looked for from him, nor from any of the church fathers. A larger sphere of freedom was permitted to religious speculation in those unfettered days, before creeds were encircled with that traditional sanctity they now possess. Nevertheless, we have little difficulty in determining the central

tenets of his theological belief. He held the corruption of human nature through the fall of man, and the consequent slavery of the human will. Both on metaphysical and religious grounds, he asserted the doctrine of predestination, from which he necessarily deduced the corollary doctrines of election and reprobation; and finally, he strenuously supported, against the Pelagians, not only these opinions, but also the doctrine of the perseverance of the saints. At the same time, it is but fair to add that, even on such points, his language is far from uniform; that much of the severity of his doctrines arose from the bitter and painful remembrance of his own early sins, and from the profound impression which the corrupt state of society in his time, and the vast desolations of barbarism, had made on his earnest and susceptible soul; and that, in his desire to give glory to God, he sometimes forgot to be just to man. In illustration of this may be mentioned the fact that the maxim which justified the chastisement of religious errors by civil penalties, even to burning, was established and confirmed by the authority of Augustine, and thus transmitted to succeeding ages. In his epistle to Dulcinius, a civil magistrate who shrank from putting in force the edict of Honorius against heretics, he uses these words: 'It is much better that some should perish by their own fires, than that the whole body should burn in the everlasting flames of Gehenna, through the desert of their impious dissension.' In the opinion of Neander, it was to the somewhat narrow culture, and the peculiar personal experience and temperament of Augustine, that the doctrines of absolute predestination and irresistible grace, first systematised by him, owed much of that harshness and one-sidedness which so long obstructed their general reception by the church, and which continue to render them repulsive to multitudes. It was not, however, by his controversial writings merely, but by his profound conception of Christianity and the religious life, and by his personal fervour and force of character that Augustine moulded the spirit of the Christian church for centuries. The church regarded him as the greatest of the fathers, and at the Reformation Protestants and Catholics alike appealed to his authority. Calvinism is by many regarded as little more than a reassertion of Augustinianism, though this is denied by the Catholic Church; and Jansenism was held by its supporters as the only real expression of Augustine's views. See articles CALVIN, JANSEN, ELECTION, HELL, PREDESTINATION, WILL.

The best complete edition of his works is that of the Benedictines, published at Paris in 8 vols. (11 parts) folio (1679-1700; reprinted in 22 half-vols. 1836-40). They occupy 16 vols. (32-47) of Migne's *Patrologia Latina*. Numerous editions of the *Confessiones* and *De Civitate Dei* have appeared. A complete English translation of his works was published at Edinburgh in 15 vols. (1872-80) under the general editorship of Dr Marcus Dods, the *City of God* being by the editor, the *Confessiones* by the Rev. J. G. Pilkington, the *Letters* by the Rev. J. G. Cunningham.

See the Church Histories and Milman's *Latin Christianity*; German works by Cloth (1840), Bindemann, Dörner, and Bohringer (1878); Poujoulat's monograph, and Bertrand's (1912); the article in Hauck-Herzog (1896); Harnack's *History of Dogma*, and the section on Augustine's Confessions in his *Monasticism* (trans. 1901); Dean Beeching's introduction to Pusey's translation of the Confessions (1904); Dr W. Cunningham's *St Austin and his Place in the History of Christian Thought* (1885); McCabe's *St Augustine and his Age* (1902).

Augustine, or AUSTIN, ST, first Archbishop of Canterbury, was prior of the Benedictine monastery

of St Andrew at Rome, when, in 596, he was sent, with forty other monks, by Pope Gregory I., to convert the Anglo-Saxons to Christianity, and establish the authority of the Roman see in Britain. Landing in Thanet, the missionaries were kindly received by Ethelbert, king of Kent, whose wife Bertha, daughter of the Frankish king, was a Christian, and retained a bishop in her suite as chaplain. A residence was assigned to them at Canterbury, where they devoted themselves to monastic exercises and preaching. The conversion and baptism of the king contributed greatly to the success of their efforts among his subjects, and it is recorded that in one day Augustine baptised 10,000 persons in the river Swale. Nominal as much of this conversion must have been, there is abundant testimony to the fact that a marked improvement in the life and manners of the Anglo-Saxons followed the evangelistic labours of Augustine and his companions. In 597 he went to Arles, and there was consecrated Bishop of the English. On his return, he despatched a presbyter and monk to Rome, to inform the pope of his success, and obtain instruction on certain questions. Gregory's counsels with regard to the propagation of the faith are admirable examples of that pious ingenuity which has often characterised the missionary policy of the Church of Rome. Thus, instead of destroying the heathen temples, Augustine was recommended to convert them into Christian churches, by washing the walls with holy water, erecting altars, and substituting holy relics and symbols for the images of the heathen gods. Augustine's subsequent efforts to extend his authority over the native British church, with whose bishops he held a conference in 603 on the Severn, failed. He died in 604.

In 612 his body was translated to his abbey (SS. Peter and Paul), whose site is now occupied by St Augustine's Missionary College (1845). See GREGORY; Plummer's *Bede*; and books by Cutts (1895), Mason, Browne, Father Brou, S.J., Collins, Sir H. H. Howorth (1913).

Augustinians, the name given to several religious bodies in the Roman Catholic Church. Whether St Augustine ever framed any formal rule of monastic life, is uncertain; but one was deduced from his writings, and was adopted by as many as thirty monastic fraternities, of which the chief were the Canons Regular of St Augustine, the Begging Hermits or Austin Friars, the Friars Preachers or Dominicans (q.v.), and the Premonstratensians (q.v.). The Canons Regular of St Augustine, or Austin Canons, appear to have been founded or remodelled about the middle of the 11th century. Their discipline was less severe than that of monks properly so called, but more rigid than that of the secular or parochial clergy. They lived under one roof, having a common dormitory and refectory. Their habit was a long cassock, with a white rochet over it, all covered by a black cloak or hood, whence they were often called Black Canons. Probably founded at Avignon about 1061, they had their first seat in England at Colchester (*circa* 1105); and at the Reformation their houses somewhat exceeded 200 in number. Of some 25 houses in Scotland, the earliest was that of Scone (1114), and the others of most note were at Inchcolm in the Firth of Forth, St Andrews, Holyrood, Cambuskenneth, and Inchaffray.

The Begging Hermits, Hermits of St Augustine, or Austin Friars, were a much more austere order, renouncing all property, and vowing to live by the voluntary alms of the faithful. They are believed to have sprung from certain societies of recluses who, in the 11th and 12th centuries, existed especially in Italy without any regulative constitution. At the instigation, as is alleged, of the

rival fraternities of Dominicans and Franciscans, Pope Innocent IV., about the middle of the 13th century, imposed on them the rule of St Augustine, whom they claimed as their founder. In 1256 Pope Alexander IV. placed them under the control of a superior or president called a 'general.' In 1287 a code of rules or constitutions was compiled, by which the order long continued to be governed. About 1570 Friar Thomas of Jesus, a Portuguese brother of the order, introduced a more austere rule, the disciples of which were forbidden to wear shoes, whence they were called *discalceati*, or 'bare-footed friars.'

The degeneracy of the order in the 14th century, called into existence new or reformed Augustinian societies, among which was that Saxon one to which Luther belonged. But in his day, even these had fallen victims to the general corruption of monasticism, and were not undeserving of his unsparing denunciations. After the French Revolution, the order was wholly suppressed in France, Spain, and Portugal, and partly in Italy and Southern Germany. It was diminished even in Austria and Naples. It is most powerful in America, its colleges in the New World having been founded by Augustinians from the Irish province.

The name of Augustines was given also to an order of nuns who claimed descent from a convent founded by St Augustine at Hippo, of which his sister was the first abbess. They were vowed to the care of the sick and the service of hospitals. See GILBERTINES, TRINITARIANS.

Augustobona. See TROYES.

Augustodunum. See AUTUN.

Augusto'vo, a town of Poland, 138 miles NE. of Warsaw. Founded by King Sigismund Augustus in 1547, scene of Russian victories over the Germans in 1914-15, it has woollen and linen manufactures. The Netta, a feeder of the Bug, flowing out of a lake rich in fish, connects by canal with the Niemen. Pop. 12,000.

Augustulus, ROMULUS, the last emperor of the western half of the old Roman empire. His name was Augustus, but the diminutive title under which he is universally known was given him by the Romans on account of the essential littleness of his character. His father, Orestes, a Pannonian of good birth and wealth, had risen to high rank under the Emperor Julius Nepos, whose favour he repaid by stirring up the barbarian troops in the pay of Rome to mutiny against him. On the flight of the emperor, Orestes conferred the vacant throne on his son Augustulus (475 A.D.), retaining all substantial power in his own hands. Orestes failing to conciliate the barbarians, who had helped him against Nepos, with a grant of one-third of the lands of Italy, they, under the command of Odoacer, besieged him in Pavia, and killed him on the capture of the town. Augustulus yielded at once (476), and being of too little consequence to be put to death, was dismissed to a villa near Naples with an annual pension of 6000 pieces of gold. His after-fate is unknown.

Augustus, CAIUS JULIUS CÆSAR OCTAVIANUS, son of Caius Octavius and Atia (Julius Cæsar's niece), was born in 63 B.C. The Octavian family came originally from Velitra, in the country of the Volsci; and the branch to which Augustus belonged was rich and honourable. His father had risen to the rank of senator and prætor, but died in the prime of life, when Augustus was only four years old. Augustus was carefully educated in Rome under the guardianship of his mother and his step-father; and his talents recommended him to his great-uncle, Julius Cæsar, who adopted him as his son and

heir. At the time of Cæsar's assassination (44 B.C.), Augustus was a student under the celebrated orator Apollodorus, at Apollonia in Illyricum, whither, however, he had been sent chiefly to gain practical instruction in military affairs. He returned to Italy, and, now first learning that he was his uncle's heir, assumed the name of Julius Cæsar Octavianus. The soldiers at Brundisium saluted him as Cæsar; but he declined their offers, and entered Rome almost alone. The city was at this time divided between the republicans and the friends of Mark Antony; but the latter, by adroit manœuvres, had gained the ascendancy, and enjoyed almost absolute power. At first, Augustus was haughtily treated by Antony, who refused to surrender Cæsar's property; but after some fighting, in which Antony was worsted, and forced to flee across the Alps, Augustus, who had made himself a favourite with the people and the army, obtained the consulship, and carried out Cæsar's will. He found an able advocate in Cicero, who at first had regarded him with contempt. To himself the great orator seemed to be labouring in behalf of the republic, whereas he really was only an instrument for raising Augustus to supreme power. When Antony returned from Gaul with Lepidus, Augustus threw off the republican mask, and joined them in establishing a triumvirate. He obtained Africa, Sardinia, and Sicily; Antony, Gaul; and Lepidus, Spain. Their power was soon made absolute by the massacre of those unfriendly to them in Italy, and by the victory at Philippi over the republicans under Brutus and Cassius. The Perusian war, excited by Fulvia, wife of Antony, seemed likely to lead to a contest between Augustus and his rival; but was ended by Fulvia's death, and the subsequent marriage of Antony with Octavia, sister of Augustus. Shortly afterwards, the Roman world was divided anew, Augustus taking the western half, and Antony the eastern, whilst Lepidus had to content himself with Africa. The contest for supremacy commenced. While Antony was lost in luxurious dissipation at the court of Cleopatra, Augustus was industriously striving to gain the love and confidence of the Roman people, and to damage his rival in public estimation. War was at length declared against the Egyptian queen, and at the naval battle of Actium (31 B.C.), Augustus was victorious, and became sole ruler of the whole Roman world. Antony and Cleopatra soon afterwards ended their lives by suicide; Antony's son by Fulvia, and Cæsarion, son of Cæsar and Cleopatra, were put to death; and in 29 B.C., after regulating affairs in Egypt, Greece, Syria, and Asia Minor, Augustus returned to Rome in triumph, and, closing the temple of Janus, proclaimed universal peace.

His subsequent measures were mild and prudent. To insure popular favour, he abolished the laws of the triumvirate, and reformed many abuses. Hitherto, since Cæsar's death, he had been named Octavian; but now the title of *Augustus* ('sacred' or 'consecrated') was conferred on him. In his eleventh consulship (23 B.C.), the tribunician power was granted him for life by the senate. Republican names and forms still remained, but they were mere shadows; and Augustus, in all but name, was absolute monarch. In 12 B.C., on the death of Lepidus, he had the high title of Pontifex Maximus bestowed on him. The nation surrendered to him all the power and honour that it had to give.

After a course of victories in Asia, Spain, Pannonia, Dalmatia, Gaul, &c., Augustus (9 B.C.) suffered the one crushing defeat of his long rule, in the person of Quintilius Varus, whose army was

annihilated by the Germans under Arminius (q.v.). The loss so afflicted Augustus, that for some time he allowed his beard and hair to grow, as a sign of deep mourning, and often exclaimed: 'O Varus, Varus, give me back my legions!' Thenceforth he confined himself to plans of domestic improvement and reform, and so beautified Rome, that it was said, 'Augustus found the city built of brick, and left it built of marble.' He also built cities in several parts of the empire; and altars were raised by the grateful people to commemorate his beneficence; while by a decree of the senate, the name Augustus was given to the month *Septilis*.

Though thus surrounded with honour and prosperity, Augustus was not free from domestic trouble. The abandoned conduct of his daughter Julia was the cause of sore vexation to him. He had no son, and his nephew Marcellus, and Caius and Lucius, his daughter's sons, whom he had appointed as his successors and heirs, as well as his favourite step-son Drusus, all died early; while his step-son Tiberius was an unamiable character whom he could not love. Age, sorrow, and failing health warned him to seek repose; and, to recruit his strength, he undertook a journey to Campania; but his infirmity increased, and he died at Nola (14 A.D.), in the seventy-seventh year of his age. According to tradition, shortly before his death, he called for a mirror, arranged his hair neatly, and said to his attendants: 'Did I play my part well? If so, applaud me!' Augustus had consummate tact and address as a ruler and politician, and made use of the passions and talents of others to forward his own designs. The good and great measures which marked his reign were originated mostly by himself. He encouraged agriculture, patronised the arts and literature, and was himself an author; though only a few fragments of his writings have been preserved. Horace, Virgil, Ovid, Propertius, Tibullus, and Livy adorned the *Augustan Age*—a name since applied in France to the reign of Louis XIV., in England to that of Queen Anne. See books on Augustus by E. S. Shuckburgh (1903) and J. B. Firth (1903).

Augustus, Elector of Saxony (1553-86), was born July 31, 1526, at Freiberg, and spent much of his boyhood at Prague, where he formed an intimate friendship with Maximilian, King Ferdinand's son, afterwards Emperor of Germany. In 1548 he married Anna, daughter of Christian III. of Denmark, who was universally popular on account of her devoted adherence to Lutheranism and her domestic worth. After the death of his brother Maurice in 1553, Augustus succeeded to the electorate. His rule is chiefly noticeable as bearing upon the history of the newly established Protestant Church. Equally intolerant and inconsistent in his theology, Augustus first used his utmost influence in favour of the Calvinistic doctrine of the sacraments; and then, in 1574, adopted the Lutheran tenets, and persecuted the Calvinists. On the other hand, it must be owned that he introduced valuable reforms in both jurisprudence and finance, and gave a decided impetus to education, agriculture, manufactures, and commerce. The Dresden Library owes its origin to him, as do also most of its galleries of art and science. He died at Dresden, February 11, 1586, and was succeeded by his son, Christian I.

Augustus II. (more accurately, **FREDERICK-AUGUSTUS I.**), Elector of Saxony and king of Poland, second son of the Elector, John George III., was born at Dresden, May 12, 1670. His extraordinary strength gained him the nickname of 'the Strong.' From 1687 to 1689 he travelled over the greater part of Europe, and in 1694 succeeded his brother George as Elector, and

undertook the command of the imperial army against the Turks in Hungary. After the battle of Olasch, in 1696, he returned to Vienna as a candidate for the throne of Poland, vacated by John Sobieski. Bidding higher than Prince Conti for the crown, and adopting the Catholic faith, he was elected king by the venal nobles, and was crowned in 1697. On ascending the throne, he promised to regain, for his new kingdom, the provinces that had been ceded to Sweden; but his efforts to do this only led to the defeat of himself and his allies, his own deposition as king of Poland, the election of Stanislaus Leszczyński, and the ignominious peace of Altranstadt in 1706. So complete was his humiliation, that Augustus was compelled to send a letter of congratulation to the new Polish king, together with all the crown-jewels and archives. However, on the defeat of Charles XII. at Pultowa, in 1709, he declared the treaty of Altranstadt annulled, marched with a powerful army into Poland, formed a fresh alliance with the czar, and recommenced a war with Sweden, which continued raging with redoubled fury, till the death of Charles XII., in 1718, led to a peace with Sweden. Meanwhile, the jealousy of the Poles caused the withdrawal of the Saxon troops in 1717. The remainder of the reign is marked by no important event, till the king's death, 1st February 1733. The Saxon court gradually became known as the most dissolute in Europe, and the resources of both kingdoms were shamefully squandered to supply its extravagances. Augustus supported the fine arts as ministering to luxury, but did little for the cause of science. Reckless, selfish, ambitious, luxurious, licentious, and despotic, he is powerfully depicted in Carlyle's *Frederick the Great*. By his wife he left an only son, who succeeded him. The most celebrated of his numerous illegitimate offspring—amounting, it is affirmed, to somewhere about 350—was Count Maurice of Saxony (see SAXE).

Augustus III. (or FREDERICK-AUGUSTUS II.), the son and successor of the above, was born at Dresden, October 7, 1696, and carefully educated by his mother in the Protestant faith. In the course of a tour through Europe, however, he changed his religion, secretly professing Catholicism at Bologna in 1712, though the fact was not publicly known in Saxony till five years later. He succeeded his father as Elector in 1733, and was chosen king of Poland by a part of the nobility. Jealousy of French influence secured him the support of Russia and Austria against Stanislaus Leszczyński, who had married a daughter to Louis XV., and three years later Augustus was elected. He inherited his father's sumptuous tastes, though not his talents; and he enriched the gallery of Dresden with noble paintings, for which, and its china, his capital now began to be celebrated. In 1742, alarmed at the increased power Prussia had obtained by the conquest of Silesia, Augustus formed an alliance with Maria Theresa: and by the secret treaty of Leipzig, contracted to supply her with 50,000 men. But their united troops were completely routed by the Prussians in 1745; and Frederick II. pushing on into Saxony, Augustus had to escape from his capital, saving his art-treasures, but leaving his state-papers in the hands of the conqueror. In 1746 the peace of Dresden restored him Saxony; but 1756 (see SEVEN YEARS' WAR) again saw him embroiled with Prussia. Joining the camp at Pirna, he narrowly escaped being taken prisoner, and had to flee to Poland. At the conclusion of the peace of Hubertsburg, Augustus returned to Dresden, where he died, October 5, 1763. The notorious Count Brühl (q.v.) was his favourite, and from 1746

onwards, his prime-minister. His son, Frederick-Christian, succeeded him in the electorate, and Stanislaus Poniatowski became king of Poland.

Auk (*Alca*), a genus of pelagic birds, familiarly represented by the Razor-bill (*Alca torda*), which ranges from Jan Mayen and Greenland to Maine and Brittany, or even farther south. The flightless Great Auk or Garefowl (*Alca impennis*) of the North Atlantic has not been seen since 1844. The Little Auk or Rotche, a bird of passage off British coasts, is referred to a different genus, and is known as *Mergulus alle*; similarly the Guillemots belong to nearly related genera (*Uria*, *Cephus*), the Auklets to others (e.g. *Cerorhyncha*, *Cyclohychnus*), and the Puffins to others (*Fratercula*, *Lunda*). All these birds are included in the family *Alcidae*, which is equivalent to the sub-order *Alcae*, regarded by some good authorities as made up of highly specialised derivatives of a plover stock. In any case, auks have no relationships with divers or with penguins. Among their general characters may be noted the elongated body, well suited for locomotion under water; the backward shunting of the legs, which increases the speed and power of the stroke and explains the curious upright attitude of the birds when sitting on the rocks; the greatly elongated ribs and hip-girdle; the short wings, usually capable of strong and rapid flight; the webbed feet; the close plumage, usually black or brown and white; the short tail; and the strong bill suited for fish-catching. They are typically open sea birds, but their breeding-places are usually on cliffs and steep shores. There is usually a single egg, which is laid on a rocky ledge (razor-bill.

The Great Auk (*Alca impennis*).

guillemot, &c.) or in a burrow (puffin). The auks are confined to the northern hemisphere, with their headquarters in the North Pacific, though a number of species inhabit the North Atlantic. The Great Auk (*Alca impennis*), also known as the Garefowl, used to occur in the North Atlantic, but apparently not within the arctic circle. It was hunted down by the northern fishermen to furnish food and bait, and it was finally exterminated by collectors for museums. It resembled an exaggerated razor-bill, and was nearly the size of a tame goose. A large patch of white occurred on the glossy black head between the eyes and the bill. The small wing was incapable of supporting the bird in flight, and low islets were therefore used as breeding-places. The large egg (about 5 inches in length) resembled that of a razor-bill, but was

more variable, and some of those that are treasured in collections show the greenish ground colour or the curious scrollings more characteristic of the guillemot. Records describe the Great Auk as exceedingly expert in the water, and exceedingly helpless on land. Reports of its tameness or stupidity probably mean that it had not experience of what the presence of man implied. Remains have been found in many parts of Ireland, in parts of Scotland, of the north of England, and of Denmark, on the coast of Maine and Massachusetts, and abundantly on Funk Island. On the other side of the Atlantic the bird got the name 'penguin,' now transferred to a very different type. Over seventy eggs and a somewhat larger number of birds remain in museums as residues of this interesting species. An egg has been known to fetch £200, and a specimen twice as much. See Symington Grieve, *The Great Auk or Garefowl* (Edin. 1885); F. A. Lucas, 'Expedition to the Funk Island, with Observations upon the History and Anatomy of the Great Auk,' *Report U.S. National Museum, 1887-88*, pp 493-529. A selected bibliography will be found in Newton's *Dictionary of Birds* (1893), p. 308.

Aulapolai, ALAPULAI, or ALLEPPEY, the chief seaport (with a lighthouse) of the Travancore state, Madras, 33 miles S. of Cochin. Its roadstead is sheltered by a mud-bank; and there is a considerable trade in coffee, coir, pepper, and cardamoms. Communication is maintained with the railway at Quilon on the south, and at Cochin on the north, by canals parallel with the sea-coast, and connecting a series of lakes or back-waters. Between these and the sea is a wide creek, through which is floated the timber for exportation, which is brought from the forests of the Rajah of Travancore on the Western Ghats. Pop. 25,000.

Aula Regis, also called CURIA REGIS, is a name used in English history for a feudal assembly of tenants-in-chief, for the Privy-council (q.v.), and for the court of King's Bench. See COMMON LAW.

Auldearn, a Nairnshire village, 2½ miles ESE. of Nairn. Near it Montrose won his fourth victory, 9th May 1645. Pop. 300.

Aulic Council (Lat. *aula*, 'court' or 'hall'; Ger. *Reichshofrath*), a court of the Holy Roman empire, established in 1501 by Maximilian I., and co-ordinate with the Imperial Chamber (*Reichskammergericht*; established 1495). See Bryce's *Holy Roman Empire*.

Aulis, a small port of Boeotia on the Euripus, near the modern Vathy, was famous as the starting-place of the Greek fleet for Troy. In its temple of Artemis Iphigenia was to be sacrificed.

Aulnoy, MARIE CATHERINE JUMELLE DE BERNEVILLE, COMTESSE D', was born about 1650, and died in 1705. She wrote many tedious and long-winded romances long consigned to safe oblivion. Of these need here only be mentioned *L'Histoire d'Hippolyte, Comte de Douglas* (1690). Equally worthless are her historical memoirs. But her fame rests securely on her *Contes des Fées*, which are written in a simple, bright, and charming style, not altogether unworthy of the inimitable master, Perrault. The White Cat, the Yellow Dwarf, Finette Cendron, and Le Mouton have for two centuries been naturalised in the nurseries of Europe, and have been familiar figures in pantomime. See Lady Richmond Ritchie's introduction to an English translation of the *Fairy Tales* (1892).

Aulus Gellius. See GELLIUS.

Aumale (earlier *Albemarle*), a French town of 2000 inhabitants, in the department of Seine-Inférieure, on the Brestre. From 1547 it gave the title of duke to various families.—AUMALE, a

town of Algeria, 57 miles SE. of Algiers. It is a strong military post. Pop. 4000.

Aumale, CHARLES DE LORRAINE, DUC D', born 1556, was an ardent partisan of the League in the religious wars which devastated France in the latter half of the 16th century. The aim of the League was ostensibly to suppress the Huguenots, but in reality to secure the supreme power to the Guises. Closely allied by blood to this crafty and ambitious family, Aumale, after the murder of the Duke of Guise in 1588, became, along with the Duke of Mayenne, the leader of the party. Defeated at Senlis by the Duke of Longueville, and at Arques and Ivry by Henry IV., he still attempted to defend Paris, and when Henry was recognised as king in France, he went over to the Spaniards, refused the royal pardon, and delivered over to the enemy several places in his possession. For this he was impeached, condemned, and sentenced to be broken alive on the wheel. His property was confiscated, but he himself escaped. He lived in exile till his death, which took place at Brussels in 1631. With him the old Dukes d'Aumale of the house of Lorraine became extinct.

Aumale, HENRI-EUGÈNE-PHILIPPE-LOUIS D'ORLÉANS, DUC D', fourth son of King Louis-Philippe, was born at Paris, January 16, 1822. Educated at the college of Henri IV., at sixteen he entered the army, and two years later found himself in active service in Algeria, where he soon distinguished himself by his bravery, and passed rapidly through the various grades of rank. One of his most brilliant exploits was the surprise of Abd-el-Kader in May 1843. For this he was made Lieutenant-general, and appointed to the government of the province of Constantine. In 1847 he succeeded Marshal Bugeaud in the governor-generalship of Algeria, but after the revolution of February 1848, laid down his office, and retired to England. In his exile he occupied himself with historical and military studies, and soon became known by his contributions to the *Revue des Deux Mondes*. A speech of Prince Napoleon in the senate against the Orleans family called forth in April 1861 his famous pamphlet, *Lettre sur l'Histoire de France*, in which the prince and Napoleon III. were subjected to a merciless castigation. His great historical work, *Histoire des Princes de Condé* (Paris, 1869), was published only after much difficulty. In the journal *Étoile Belge* there appeared (1865-66) a series of critical letters by him, under the pseudonym of 'Verax,' on the policy of the empire, and in 1867 his celebrated work, *Les Institutions militaires de la France*. On the outbreak of the Franco-German war, he offered his services, first to the emperor, afterwards to the provisional government, without being accepted by either, but in 1871 he was elected a member of the Assembly. In 1873 he presided over Marshal Bazaine's court-martial, and afterwards held several high commands, but was disqualified from further service in 1883. Elected a member of the Academy in 1871, in 1886 he bequeathed his magnificent château of Chantilly to the Institute of France. The decree expelling him from Paris was revoked in 1889. He died 6th May 1897, in consequence of the shock caused by the burning of his niece, the Duchess d'Alençon, at the Paris bazaar. His wife (*née* Marie Caroline Auguste de Bourbon, daughter of the Prince of Salerno) had died in 1867; his elder son in 1866, the younger in 1872. See Ernest Daudet's *Le Duc d'Aumale* (1898).

Aungerville, RICHARD, Bishop of Durham, is known as Richard de Bury, from his birthplace, Bury St Edmunds. He was born in 1281, studied with distinction at Oxford, became a Benedictine monk at Durham, and was made tutor to Edward

of Windsor, afterwards Edward III., by whom in after-years numerous honours were bestowed upon him. In 1333 he was appointed Dean of Wells, and in the same year was made Bishop of Durham by the pope at the king's request, despite the fact of the monks having elected their sub-prior, Robert de Graystones. After holding the office of high chancellor for a year, he resigned it in 1335 to act as the king's ambassador in Paris, Hainault, and Germany. In 1337 he was employed as a commissioner for the affairs of Scotland, and in 1342 he arranged a truce with the Scottish king. He died in 1345. Richard administered the affairs of his diocese with ability, as appears from his chancery rolls, which are the earliest preserved in the archives of Durham. An admirable ecclesiastic, he was kind and charitable to the poor. But he is chiefly known as a scholar and patron of learning, and he used his high offices of state to gratify his passion for discovering manuscripts and collecting books. His principal work, *Philobiblion*, was intended to serve as a handbook to the library which he founded in connection with Durham College at Oxford (afterwards suppressed). It gives an interesting account of how he collected his library, describes the state of learning in England and France, and closes with an explanation of the rules for the management of his library, which were founded on those adopted for the library of the Sorbonne. He had wide literary sympathies, commended the study of the poets, and provided his library with Greek and Hebrew grammars. At the dissolution of the monasteries, books of his went partly to the Bodleian, partly to Balliol, and partly to the purchaser of Durham College.

Aurangabad, Aurangzeb. See AURUNGABAD, AURUNGZEBE.

Aurantia cæ (from late Lat. *aurantium*, 'an orange'), an order of Thalamifloral Dicotyledons, frequently grouped under Rutaceæ, are trees and shrubs, often of great beauty. The order contains about one hundred known species, natives of warm climates, and almost all of the East Indies, but now largely diffused by cultivation. The species of the genus *Citrus* are the best known, among which are the orange, lemon, citron, &c. But many other genera produce agreeable fruits, among which the Bael-fruit (*Ægle marmelos*, q.v.) and the Wampi (*Clausena wampi*) deserve particular notice. The fruits, ripe and unripe, juice and rind, the flowers, leaves, bark, &c. of a number of species are employed medicinally, their properties being largely due to the fragrant volatile oil, which abounds especially in the leaves and the rind of the fruit. See *ÆGLE*, *CITRON*, *LEMON*, *LIME*, *ORANGE*, *SHADDOCK*.

Auray, a port in the French department of Morbihan, 20 miles E. of Lorient by rail, with some trade. Pop. 7000. Here is a large deaf and dumb institute; and 2 miles north is the famous place of pilgrimage of St Anne of Auray, with a fine church completed in 1877.

Aurelia. See CHRYSALIS.

Aurelianus, LUCIUS DOMITIUS—also named CLAUDIUS DOMITIUS and VALERIUS—one of the most powerful of the Roman emperors, was of very humble origin, his father having been a husbandman. He was born in Dacia or Pannonia about 212 A.D., and enlisting early as a common soldier, he rapidly distinguished himself, and held the highest military offices under Valerianus and Claudius II. On the death of Claudius (270), Aurelianus was elected emperor by the army, with whom his great stature, strength, and courage had made him very popular. He commenced his reign by repulsing the barbarian Alemanni and Marcomanni, and then proceeded to erect a new

line of fortified walls round Rome, the ruins of which may still be traced. Finding that the province of Dacia could not be maintained against the assaults of the Goths, he surrendered it on certain conditions, and strengthened the frontier of the Roman empire by making the Danube its boundary. He next turned his attention to the East, where the renowned queen, Zenobia (q.v.), had extended her sway from Syria to Asia Minor and Egypt. Aurelianus defeated her in two battles, and besieged her in Palmyra, from which she attempted to escape when she saw defence would prove unavailing. She was, however, taken prisoner, and soon after the city surrendered, and was treated leniently. Shortly after he had departed, a new insurrection took place. He returned in 273, and gave the splendid city up to destruction. Aurelianus was again called to the East by a rebellion in Egypt, instigated by Firmus, a merchant of great influence, which he speedily quelled. In Gaul, Tetricus, who had held imperial power since before the death of Gallienus, finding himself unable to wield it, surrendered it to Aurelianus. By restoring good discipline in the army, order in domestic affairs, and political unity to the Roman dominions, this prince merited the title awarded to him by the senate—'Restorer of the Roman Empire.' He was assassinated at the instigation of a faithless secretary, between Heraclæa and Byzantium, during his campaign against the Persians (275).

Aurelius. MARCUS AURELIUS ANTONINUS, the best of the Roman emperors, and one of the noblest figures in history, was the son of Annius Verus and Domitia Calvilla, and was born at Rome on the 26th of April 121 A.D. His original name was Marcus Annius Verus. On the death of his father, he was adopted by his grandfather, who spared no pains to render him pre-eminent in every art and science. His fine qualities early attracted the notice of the Emperor Hadrian, who, playing on the boy's paternal name of Verus, used to call him *Verissimus* ('the most true'), and who conferred high honours on him while yet a child. When only seventeen years of age, he was adopted, along with L. Ceionius Commodus, by Antoninus Pius, who had succeeded Hadrian; and Faustina, the daughter of Pius, was selected for his wife. In the year 140 A.D. he was made consul; and from this period to the death of Pius in 161, he continued to discharge his public duties with the greatest promptitude and fidelity, while he maintained relations with the emperor of the warmest and most friendly kind. On his accession to the throne, with characteristic magnanimity he voluntarily divided the government with his adopted brother, young Commodus, called since his adoption Lucius Aurelius Verus. As the latter excelled in manly exercises, Aurelius determined to intrust to him the management of war. Towards the close of 161, the Parthian war broke out, and Verus was sent to quell it; but he proved himself completely incompetent, and only the ability of his generals, especially Avidius Cassius, saved the Romans from disaster. Verus on his return enjoyed a triumph to which he had no real claim; for all the victories had been won by others while he was revelling in the most extravagant licentiousness. Meanwhile clouds were forming on the horizon elsewhere. A formidable insurrection had long been preparing in the German provinces; the Britons were on the point of revolt, and the Catti waiting for an opportunity to devastate the Rhenish provinces. Within Rome itself a pestilence began to rage, believed to have been brought home by the troops of Verus; while frightful inundations and earthquakes laid large portions of the city in ruins, destroyed the granaries in which were kept

the supplies of corn, and thus created widespread famine and distress, adding to the terror which the citizens entertained of their savage enemies. Aurelius now resolved to lead his legions to the war himself. He was completely successful. The Marcomanni, and the other rebellious tribes inhabiting the country between Illyria and the sources of the Danube, were humbled, and compelled to sue for peace in 168; a year later Verus died. The contest was renewed two years afterwards, and the emperor was obliged to make up for the ravages of plague among his soldiers by enlisting vast numbers of gladiators and slaves. He made Pannonia his headquarters, and drove out the Marcomanni, whom he subsequently all but annihilated in crossing the Danube. The most famous victory of the war was that gained over the Quadi in 174 A.D., which was attributed by the Christians to an answer to the prayers of some soldiers of their faith in what afterwards became known as the 'Thundering Legion.' It is certain that a signal deliverance did save the army from disaster. Entangled in a defile, and under a boiling sun, the soldiers were ready to perish from thirst and fatigue, when suddenly the cloudless sky darkened, and heavy showers of rain fell, which they caught eagerly in their helmets. While they were thus engaged, the enemy attacked, and would have cut them to pieces had not a blinding storm of hail and lightning fallen immediately on their faces. But this deliverance was ascribed by the Romans to the prayers of the emperor himself, and it is certain that the title in question had belonged to a particular legion since the time of Augustus. The effect of this remarkable victory was instantaneously and widely felt. The Germanic tribes hurried from all quarters to make their submission, and obtain clemency. Hardly had the emperor had a moment's respite before he was summoned to the East by a rebellion of the ambitious governor, Avidius Cassius, who had seized the whole of Asia Minor. Before Aurelius arrived, the usurper had fallen by an assassin's hand. The emperor's conduct on hearing of his enemy's death was worthy of the sublime virtue of his character. He lamented that the Fates had not granted him his fondest wish—to have freely pardoned the man who had so basely conspired against his happiness. On his arrival in the East, he exhibited the same illustrious magnanimity. He burned the papers of Cassius without reading them, so that he might not be tempted to suspect any as traitors; treated the provinces which had rebelled with extreme gentleness; and disarmed the enmity and dispelled the fears of the nobles who had openly favoured his insurgent lieutenant. While pursuing his work of restoring tranquillity, his wife Faustina died in an obscure village at the foot of Mount Taurus; and her husband, though he could scarcely have been unconscious of her unworthiness, paid the most lavish honours to her memory.

On his way home he visited Lower Egypt and Greece, displaying everywhere the greatest solicitude for the welfare of his vast empire. At Athens, which this imperial pagan philosopher must have venerated as a pious Jew venerates Jerusalem, he showed a catholicity of intellect worthy of his great heart, by founding chairs of philosophy for each of the four chief sects—Platonic, Stoic, Peripatetic, and Epicurean. No man ever laboured more earnestly to make that heathen faith which he loved so well, and that heathen philosophy which he believed in so truly, a vital and dominant reality. Towards the close of the year 176, he reached Italy, and celebrated his merciful and bloodless triumph. In the succeeding autumn he departed for Germany, where fresh disturbances had broken out among the restless and volatile

barbarians. Victory again crowned his arms; but his constitution, never robust, and now shattered by perpetual anxiety and fatigue, at length gave way, and he died either at Vienna or at Sirmium, on the 17th of March 180, in the fifty-ninth year of his age, and the twentieth of his reign.

Marcus Aurelius was the flower of the Stoic philosophy. It seems almost inexplicable that so harsh and crabbed a system should have produced as pure and gentle an example of humanity as the records of either pagan or Christian history can show. In him stoicism loses all its haughty self-assertion, and is replaced by a humility that is usually regarded as the most peculiar, if almost the rarest, of the Christian graces. His youth was marked by the same lofty virtue as his maturer life. Already at twelve years of age the young philosopher was an avowed follower of Zeno and Epictetus. The Stoics, Diogenes, Apollonius, and Junius Rusticus, were his teachers, and he himself must be considered one of the most thoughtful teachers of the school. Oratory he studied under Herodes Atticus and Cornelius Fronto. His love of learning was insatiable. Even after he had attained to the highest dignity of the state, he did not disdain to attend the school of Sextus of Chæroneæ, a grandson of the celebrated Plutarch. Men of letters were his most intimate friends, and received the highest honours both when alive and dead. His own range of studies was extensive, embracing morals, metaphysics, mathematics, jurisprudence, music, poetry, and painting. There are few books that have had such a potent charm over so many hearts as the sad *Meditations* of Aurelius. His sentences reveal the loneliness of his soul, but they show us that he did not suffer himself to be embittered as well as saddened by his experience of life. A kind of self-revelation, marked by a penetrating insight, they reveal the rare serenity and elevation of his heart, and its rarer tenderness and pity. We must not forget that he did not cultivate philosophy merely in the spring-time of his life, when enthusiasm was strong, and experience had not saddened his thoughts, and when study was his only labour, but during the tumults of perpetual war, and the distraction necessarily arising from the government of so vast an empire. The man who loved peace with his whole soul died without beholding it, and yet the everlasting presence of war never tempted him to sink into a mere warrior. He maintained uncorrupted to the end of his noble life his philosophic and philanthropic aspirations. After his decease, which was felt to be a national calamity, every Roman citizen, and many others in distant portions of the empire, procured an image or statue of him, which more than a hundred years after was still found among their household gods. He became almost an object of worship, and was believed to appear in dreams, like the saints of subsequent Christian ages.

Aurelius twice persecuted the Christians: in the first persecution (166) Polycarp perished; in the second (177), Irenæus. Many have found it difficult to understand how a mind of such lofty virtue should have consented to the persecution of Christianity. The explanation is to be found in that very earnestness with which he clung to the old faith of his ancestors. He believed it to be true, and to be the parent of those philosophies which had sprung up out of the same soil; he saw that a new religion, the character of which had been assiduously, though perhaps unconsciously, misrepresented to him, both as an immoral superstition and a mysterious political conspiracy, was secretly spreading throughout the empire, and that it would hold no commerce with the older religion, but condemned it, generally in the strongest terms.

The *Meditations* were written in Greek, solely for personal purposes; their doubts, aspirations, perpendings of the problems of life, rather sad than serene, though expressing the mind of an ancient Roman philosopher, come wonderfully near the heart and conscience of modern Christians. Of this famous work Rendall says: 'For nine centuries no note or whisper betrays its existence; fourteen hundred years after they were written down the *Thoughts* re-emerge, a revelation of a personality without parallel in Greek or Roman literature.' The first edition of the text was by Xylander (Zurich, 1558), the next by Casaubon (1643); another, long the standard, by the English Puritan Gataker (1652); and a modern one by Stich (Leip. 1882). The chief English translations are by Jeremy Collier (1701), George Long (1869), Dr G. H. Rendall (*Marcus Aurelius Antoninus to Himself*, 1898), and Haines (1916). See Rendall's introduction, Renan's *Marc Aurèle* (1882), the Life by Watson (N.Y. 1884), Farrar's *Seekers after God* (1868), Matthew Arnold's *Essays in Criticism* (1888), and Dill's *Roman Society* (1905).

Aureole. See NIMBUS, ANTHELIA.

Aurich, a town in the Prussian province of Hanover, 16 miles NE. of Emden; pop. 6000.

Auricula, a genus, and **Auriculidæ,** a family of Gasteropod Mollusca (Lat. *auricula*, 'a little

Auricula.

ear'). They have a spiral shell, covered with a horny epidermis, the first whorl very large and the spire short, the lip elongated, thickened, and toothed. The respiratory organ, or 'lung,' is a space below the mantle, on the walls of which the blood is exposed to the freely admitted air. They thus belong to the Pulmonate order of Gasteropods—i.e. to the same order as the common snails, having respiratory organs adapted for breathing in air, though some of them are capable of subsisting for a considerable time in water. Some inhabit fresh-water marshes, while others prefer the vicinity of salt water. They generally belong to warm climates, and some of them attain a large size. *Auricula mada*, a native of the East Indies, is known to shell-collectors by the name of Midas's Ear.

Auricula (*Primula auricula*), a congener of the Primrose (q.v.), much cultivated in flower-gardens. The auricula has long been a florist's flower. It was highly esteemed by the Romans, and has, at least since the 17th century, received particular attention from the florists of England and Holland. It is one of those flowers the cultivation of which is often most successfully prosecuted in the little gardens of operatives near large towns. Lancashire is particularly famous for it.—The auricula has smooth, dark-green leaves, stems, and calyces, covered with a mealy powder. A similar fine dust appears also on the flowers, and adds much to their beauty. Hence it has earned the popular name of 'Dusty Miller.' The auricula is a native of the Alps and other mountains of the middle and south of Europe, and of sub-alpine situations in the same countries. It is found also on the Caucasus and the mountains of Syria; it grows in shady and moist places. In a wild state it has comparatively small flowers, of a simple yellow colour, on short stalks, forming an umbel of generally six or seven flowers, with the same delightful fragrance which adds so much to make it a favourite flower in cultivation. The leaves are

used by the inhabitants of the Alps as a remedy for coughs.

By cultivation and selection the auricula has been brought to great beauty and splendour of colour. More than 1200 varieties were reckoned as early as 1850, and new ones are continually raised from seed. All shades and combinations of

Auricula (*Primula auricula*).

yellow, maroon, and purple, usually disposed in concentric rings, are predominant; and English florists classify these into five main types, green-edged, white-edged, gray-edged, self-coloured, and alpines, the latter having the margin of two blended colours with a yellow centre. The mealiness of the flower differs much in different varieties. The auricula blooms in April and May, and often also a second time at the end of autumn, which adds to the charms of the flower-border, although it is to the first or proper flowering-season that the florist looks. It succeeds best in a rich light soil, and cultivators diligently prepare for it composts of various kinds, but in general consisting chiefly of fresh loamy soil, and of well-rotted horse or cow dung, often with the addition of a little sand. The finer varieties are always cultivated in pots, and require protection from severe weather in winter, and from wind and rain while flowering. They ought, however, previous to flowering, to stand in an airy, sunny situation. They are propagated by offsets, generally in the latter part of August. When it is proposed to raise the auricula from seed, care ought to be taken to select the finest flowers, which are encouraged to ripen their seeds by exposure to sun and air, hand-glasses being placed over them during heavy rains. The seed is sown either in autumn or spring, generally in boxes placed under shelter, or in a slight hot-bed. The more weakly plants are tended with particular care, as they are generally found to produce the finest flowers.

The name auricula is derived from *auris*, an ear, on account of a fancied resemblance of the leaf to the ears of an animal.

Auricular Confession. See CONFESSION.

Auriculate, in Botany, a term applied to leaves, stipules, &c. and signifying that they have at the base two small ear-like lobes.

Aurignac. See ANTHROPOLOGY.

Aurillac, capital of the French department of Cantal, on the right bank of the Jourdanne, 116 miles SW. of Clermont by rail. The town is mainly modern, but contains an old castle and two churches of the 14th and 15th centuries. Among its indus-

tries are tanning and painting, and it has a trade in horses, cattle, and cheese. Annual races are held there, and there are two mineral wells. Pope Sylvester II. was a native. Pop. 16,000.

Aurochs is properly the German name of the extinct species of wild ox, called by Cæsar *Urus* (q.v.). Recently the name has been erroneously used for the Bison (q.v.), found till 1919 in Lithuania.

Aurora, an enterprising city of the United States, in Kane county, Illinois, is located on Fox River, at the junction of several railroads, 30 miles WSW. of Chicago. It has machine-shops, flour-mills, manufactories of woollens, cottons, watches, cosets, silver ware, carriages, and extensive railroad workshops. Population about 36,400.—**AURORA**, a city in Indiana, on the Ohio, 24 miles W. by S. of Cincinnati. It has an extensive trade in grain and hay. Pop. 4000.

Aurora, the Latin name corresponding to the *Eōs* of Greek Mythology, the goddess of the dawn. She was the daughter of Hyperion and Theia, and sister of Helios and Selene, and wife of the Titan Astræus, to whom she bore the winds, Agestes, Zephyrus, Boreas, Notus, as well as Hesperus, the morning-star. She was described as rising in the morning from her bed in the ocean, borne along on a chariot drawn by the divine steeds Lampus and Phaëthon, ascending the heavens, where she lifted with her 'rosy fingers' the curtain of night, and announced the arrival of Helios (the sun) or of day both to gods and men. Homer frequently describes Aurora as the goddess of day, and the tragic writers identified Aurora with *Hemera* (the day). She was represented as clothed in a rosy-yellow robe, with a star shining on her forehead, and a torch in her right hand. She carried off several mortal youths of great beauty, among them Orion, Cephalus, and Tithonus.

Auro'ra Bore'al'is, or **NORTHERN LIGHTS**, the name given to the luminous phenomenon which is seen towards the north of the heavens by the inhabitants of the higher latitudes. During the winter of the northern hemisphere, the inhabitants of the arctic zone are without the light of the sun for months together, and their long dreary night is relieved by this beautiful meteor, which occurs with great frequency in these regions. Those who have explored the southern seas have seen the same phenomenon in the direction of the south pole, so that the term Polar Lights might be more appropriate than Northern Lights to designate the aurora. For the phenomenon as seen in the southern hemisphere, the name aurora australis is used. The appearance of the aurora borealis has been described by a great variety of observers in Northern Europe and in America, all of whom give substantially the same account of the manner in which the phenomenon takes place. It is briefly as follows: A dingy aspect of the sky in the direction of the north is generally the precursor of the aurora; and this gradually becomes darker in colour, and assumes the form of a circular segment, surrounded by a luminous arch, and each end approaching near to the horizon. This *dark segment*, as it is called, has the appearance of a thick cloud, and is frequently seen as such in the fading twilight before the development of the auroral light. Its density must, however, be very small, as stars are sometimes seen shining brightly through it. This dark segment is bounded by a continuous luminous arch of a transparent white with a touch of green, which varies in breadth from 1 to 6 diameters of the moon, having the lower edge sharply defined, and the upper edge only when the breadth of the arch is small. This arch may be considered to be a part of a luminous ring elevated at a considerable distance above the earth's surface, and having its

summit in most cases nearly in the magnetic meridian. An observer several degrees south of this auroral ring would see towards the north only a small arc of it, the larger part being hid by the earth; to one situated not so far south, it would appear as a larger and higher arch; to one placed below it, it would be seen as an arch passing through the zenith; and to one situated within the ring and farther north, it would be found as an arch culminating in the south. On this supposition nearly all the various positions of the auroral arch may be accounted for. The centre of the ring corresponds probably with the magnetic north, which is at present situated in the island of Boothia Felix. Hence it is that in Greenland, which is situated to the east of this island, the auroral arch has been seen stretching from north to south with its highest point in the west. The luminous arch, once formed, may remain visible for several hours, and is in a constant state of motion. It rises and falls, extends towards the east and towards the west, and breaks sometimes in one part, sometimes in another. These motions become all the more observable when the arch is about to shoot forth rays; then it becomes luminous at one point, eats in upon the dark segment, and a ray of similar brightness to the arch mounts with the rapidity of lightning towards the zenith. The ray seldom keeps the same form for any length of time; but undergoes continual changes, moving eastward and westward, and fluttering like a ribbon agitated by the wind. After some time it gradually fades in brightness, and at last gives way to other rays. When the rays are very bright, they sometimes assume a green, sometimes a violet, a purple, or a rose colour, giving to the whole a variegated and brilliant effect. When the rays darted by the luminous arch are numerous and of great length, they culminate in a point which is situated in the prolongation of the dipping-needle, somewhat south-east of the zenith. There they form what is called the *Boreal Crown*; and the whole heavens, towards the east, west, and north, present the appearance of a vast cupola of fire, supported by columns of variously coloured light. When the rays begin to be darted less brilliantly, the crown first disappears, then, here and there, the light becomes faint and intermittent, till at last the whole phenomenon fades from the sky.

The preceding description indicates the general features of the appearance of the aurora borealis; but several auroras have been described which presented striking peculiarities. Sometimes the phenomenon assumed the form of one or more curtains of light, depending from dingy clouds, whose folds were agitated to and fro, as if by the wind. Sometimes this curtain seemed to consist of separate ribbons of light, arranged side by side in groups of different lengths, and attaining their greatest brilliancy at the lower edges. In this country it is only on rare occasions, such as in 1870, that the aurora borealis occurs with the brilliancy which attends it in northern latitudes, but this description portrays the type to which such appearance of the meteor more or less approximates.

The height of the aurora has been variously estimated. The first observers were inclined to place the seat of it beyond the atmosphere; but this hypothesis is untenable, as the aurora does not seem to be affected by the rotation of the earth, but appears to be in every respect a terrestrial phenomenon. By taking observations of the altitude of the highest point of the arch of the same aurora at different stations, the heights most generally are from about 45 to 100 miles. Some authors have assigned heights as low as 5 miles, and others as high as 500 miles and even higher, but the results of recent research are not confirmatory of these

extremes. The distance of the stations at which the same aurora has been visible, indicates the enormous geographical extent, and likewise the great altitude which the phenomenon frequently attains. One aurora, for instance—that which occurred on the 25th October 1870—was seen over a large portion of the northern hemisphere, and at the same time *auroræ* were seen at many places in

when the sun is near the horizon. Other lines, however, have been seen, which cannot as yet be produced by the physicist from any known substance.

Lemstrom has shown by the observations and experiments he made at Sodankylä, that auroræ are due to currents of positive electricity illuminating the atmosphere in their passage to the earth.

Luminous appearances accompanied the setting in of a current towards the earth from the network of insulated wires with which he overspread the top of Mount Oratuntui, and this light was clearly auroral, giving the hitherto enigmatical citron line of Ångström referred to above, which is the invaluable constituent of auroral radiations. Other faint and indistinct lines are enumerated as present, and Lemstrom is of opinion that there is a tolerable agreement between some of these and the lines in the laboratory spectrum of rarefied air, but the whole subject demands further investigation.

Loomis and Fritz have severally investigated the geographical distribution of the aurora borealis. The following woodcut is from

Loomis, from which it is seen that the region of greatest auroral action is an oval-shaped zone surrounding the north pole, whose central line

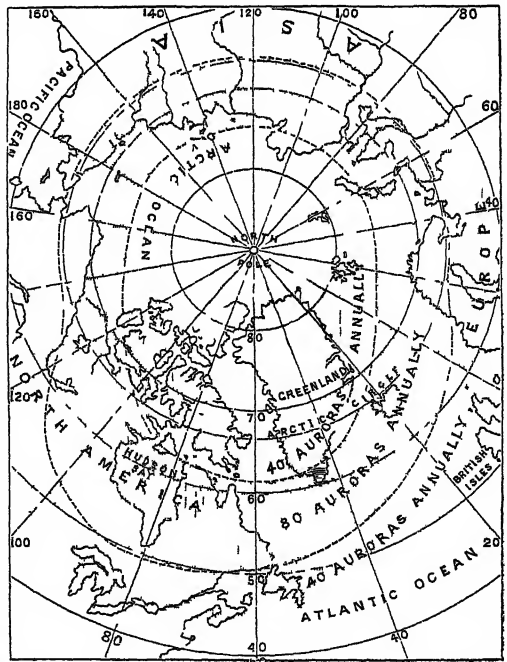

Aurora Borealis.

the southern hemisphere. Dr Sophus Tromholt, who carried out a series of investigations on the subject of the aurora borealis in the extreme north of Norway, states that the light of the aurora is never serviceable to people in their work; its contribution to lighten the darkness is almost *nil*; the momentary flashes of real luminosity are very brief and of no practical value.

The noise that is alleged to accompany the aurora borealis in high latitudes would indicate for it a comparatively moderate height; but we can scarcely yet be said to be in possession of indisputable instances of its being heard by competent observers. See the subject discussed in communications to *Nature*, especially one by Tromholt in vol. xxxii. p. 499.

The intimate connection between the aurora borealis and the magnetism of the earth is shown by various facts. During the occurrence of the phenomenon, the magnetic needle appears very much disturbed, sometimes deviating several degrees from its normal position, and appearing to be most affected when the aurora is brightest; and this oscillation is frequently perceived far beyond the district where the aurora is seen. The vertex, likewise, of the luminous arch is almost always found to be in or very near the magnetic meridian, and the boreal crown has its seat in the prolongation of the freely suspended needle. There seems, moreover, to be a connection between the magnetic poles of the earth in regard to the aurora, for, as has been frequently ascertained, the meteor occurs simultaneously at both. The aurora borealis appears to be an electric discharge connected with magnetic disturbance. If one of Cassiot's vacuum tubes be brought near an electric machine, or between the poles of an induction coil, flashes of light pass between the ends, which bear a striking resemblance to the aurora borealis. A comparison of the spectra of the two goes far to establish identity.

The auroral spectral line, discovered by Ångström in 1867, is a yellow line near the sodium line, and is the same as the air line seen in the solar light

Map showing the geographical distribution of the Aurora Borealis.

crosses the meridian of Washington in latitude 56° , and the meridian of St Petersburg in latitude 71° . It follows from this that auroræ are more frequent in North America than in the same

latitudes in Europe. Loomis points out that this auroral zone bears considerable resemblance to a magnetic parallel or line everywhere perpendicular to a magnetic meridian.

It is a fact of the greatest significance that as regards geographical distribution, auroræ and thunderstorms are complementary, auroræ being not more characteristically of polar than thunderstorms are of tropical origin. Auroræ are, however, subject to extremely complicated periodicities, indicating systematic magnetic associations; whereas thunderstorms may be regarded as completely dissociated from magnetic associations, and their periodicities are restricted to diurnal and annual variations.

The diurnal maximum of auroræ in middle latitudes, or on the equatorial side of this great auroral zone, shaded dark in the woodcut, occurs in the evening; but in Greenland and other regions on its polar side, the maximum occurs in the early morning. Further outside the auroral zone, there are two maxima in the year, one in spring and one in autumn, but at places inside this zone, the two maxima coalesce into a single maximum at the winter solstice. Thus, with an increase of solar heat, diurnal or annual, the auroral zone travels equatorwards, and with increased cold polewards; and it is extremely interesting to note that on the polar side a sunspot maximum is accompanied with auroral minimum, and the equatorial side with a maximum, thus supporting the idea that a sunspot maximum period is coincident with a maximum temperature. At the times when the solar heat is greatest evaporation is greatest, the supply of atmospheric electricity consequently more copious, increased tension brings about more speedy neutralisation, the zone of gradual recombination travels towards the equator; and thus auroræ become more frequent in middle latitudes. See the handbooks of Meteorology, numerous articles and notes by Lemström and others in *Nature* (1882-87), Tromholt's *Under the Rays of the Aurora Borealis* (1885), and Angot's *The Aurora Borealis*.

Aurangabad, the name of at least four places in India. The most important is the headquarters of a like named district in the state of Hyderabad, on the Doodna, a tributary of the Godavari. The population, once 100,000, was 34,900 in 1911. Its monuments of former grandeur are a palace, now in ruins, built by Aurungzebe when viceroy of the Deccan, and his daughter's mausoleum.

Aurangzebe (*Aurangzeb*, 'Ornament of the Throne') was the most powerful of the Mogul emperors of India, the last who ruled with energy and effect. He was born in 1618, and was the third son of Shah-Jehan. He early cherished or professed profound religious zeal. In 1657 his father, who had previously promoted him to high civil and military offices in the state, in performing the duties of which he greatly distinguished himself, was seized with an illness from which he was not expected to recover. The reins of power were at once seized by his eldest son, Dara, who was unpopular with the orthodox Mohammedans, as being too liberal in his theological views. Of the brothers, Shuja was at that time governor of Bengal, Aurungzebe of the Deccan, and Murad of Guzerat. The first immediately took up arms. Aurungzebe's policy was to let the two fight it out, and exhaust each other, and then to play off his third brother against the victor. He conferred with Murad; assured him he had no earthly ambition; that the crown he strove for was a spiritual, and not a temporal one; and that, for affection's sake, and with a view to promote the interests of the true faith, he would support his pretensions to the throne. Murad believed him, and the forces

of the two were joined. Meanwhile, Dara having overcome Shuja's army, directed his forces against his other two brothers; but Aurungzebe's plausibility prevailed over Dara's generals, who deserted, and Dara had to seek safety in flight. By this time, however, Shah-Jehan had somewhat recovered. Aurungzebe professed the utmost loyalty, but secretly gave his son instructions to take possession of Shah-Jehan's palace, which was done, and the aged monarch was made prisoner. Aurungzebe next seized and confined his too confiding brother, Murad; and after a struggle of two or three years' duration, Dara and Shuja also fell into his power, and all three were put to death. The sceptre was now firmly within the grasp of Aurungzebe. He professed not to care for the imperial insignia, but was ultimately induced to receive them in August 1658, assuming the title of Alamgir, 'Conqueror of the World,' and later, that of Mohi-eddin, 'the Reviver of Religion.' In the seventh year of Aurungzebe's reign, his father died, still in confinement.

Aurangzebe's long reign of half a century was distinguished by great outward prosperity, and has been represented as the most brilliant in Indian annals; but the empire was diseased at its heart. Everywhere there was distrust; the emperor, who had established his throne by fraud, was naturally enough distrusted by all. He lacked confidence in his statesmen, who, in their turn, distrusted him and one another. His sons imitated him in his disobedience to his father, and the Hindus, whom he treated with great harshness, excited the Mahrattas against him in the south. Still his great abilities sufficed during his reign not only to preserve his empire intact, but even to enlarge it considerably. Discord between the monarchs of Bijapur and Golconda enabled him to add these two kingdoms to his empire. But though some of the independent Mohammedan princes were subdued, the Hindu states were gathering strength for the overthrow of the Mogul power; and the seeds of decay which had been sown in his reign bore ample fruit in the reign of his son. His schemes had come to little good; most of his enterprises failed; and he may be said to have ruined the empire. His later years were passed in the fear of receiving the measure he had meted to others, and he died, a fugitive before the Mahrattas, at Ahmednagar, in February 1707. See Stanley Lane-Poole's *Aurangzeb* (1893), and J. N. Sarkar's (1912-16).

Auscultation (Lat. *auscultare*, 'to listen'), a mode of detecting diseases, especially those of the heart and lungs, by listening to the sounds produced in the cavity of the chest. This is done either by the unassisted ear (*immediate auscultation*), or by the aid of a simple sound-conveying instrument, the stethoscope (*mediate auscultation*). By care and attention, the normal sounds produced by respiration and the beating of the heart may be distinguished from the several abnormal sounds indicating disease. Developed into a scientific method by Laennec (q.v.), auscultation is classed among the most important of discoveries in modern medical science. See DIAGNOSIS, PERCUSSION. RESPIRATION, STETHOSCOPE.

Ausonius, DECIVS MAGNUS, the most conspicuous Roman poet in the 4th century, was born at Burdigala (Bordeaux), about 309 A.D. Early distinguished for his eloquence, he was appointed by Valentinian tutor to his son Gratian; and he afterwards held the offices of quaestor, prefect of Latium, and consul of Gaul (379 A.D.). On the death of Gratian, Ausonius retired from public life to his estate at Bordeaux, where he occupied himself with literature and rural pursuits until the time of his death (392). It

is most probable that Ausonius was a Christian, though the question has occasioned much controversy, and is perhaps made all the more uncertain by the impurity of his writings. His works include a collection of 150 epigrams, poems on his deceased relatives (*Parentalia*), and on his colleagues (*Commemoratio Professorum Burdigalensium*), epistles in verse and prose, and 20 so-called idylls, of which the tenth, *Mosella*, a description of a journey on the Rhine and Moselle, is perhaps the happiest of all his poems. Ausonius is but a poor poet, though he occasionally displays a certain neatness and grace of expression. See Peiper's edition (1886), and White's (1919-21), with translation.

Auspices. See AUGURIES.

Aussee, a health-resort in the Styrian Salzkammergut on the Traun, 22 miles SE. of Ischl, and 2171 feet above the level of the sea, with salt-baths and salt-works.

Aussig (Czech *Ústí*), a town in northern Bohemia, on the left bank of the Elbe, 66 miles NNW. of Prague, with large chemical-works, and manufactories of machinery, glass, pottery, woollens, and cottons; pop. 40,000. Raphael Mengs was born here.

Austen, JANE, was born 16th December 1775, at Steventon Rectory, near Basingstoke in Hampshire, the seventh of eight children. Her father, the Rev. George Austen, was a competent scholar, who carefully cherished his daughter's talent; he was regarded by the villagers as a sort of deputy-squire for his relative Mr Knight. Her mother, Cassandra Leigh, came of a family of wits. Of her six brothers, James and Henry (who had been a militia officer, and failed as a banker in London) succeeded their father as rectors of Steventon. Edward, adopted by the Knights, assumed their name on inheriting their large estates in Kent and Hants. Francis and Charles became admirals. Her sister Cassandra remained in the closest possible relations with her all her life. Though Jane Austen has no claim to be called learned, her education was better than that which most girls got towards the close of the 18th century; she learnt French and Italian, and had a good acquaintance with English literature, her favourite authors being Richardson, Johnson, Cowper, Crabbe, Fanny Burney, and Scott. In 1801 the family settled at Bath, and after the father's death there in 1805, the widow and two daughters removed (1806) to Southampton, and in 1809 to the village of Chawton (Edward Knight's property) near Alton. These removals, with school at Reading, and visits to her brothers and to Bath and Lyme, practically complete the tale of her travels. Early in 1816 her health began to give way. In May 1817 she found it necessary to remove to Winchester, for the sake of good medical advice, and she died there on the 18th of July 1817, her forty-two years of placid existence having been almost undisturbed by any but the gentler emotions. Her mode of life was that of the characters in her novels. She was a good needlewoman; sang and played passably, but was apparently no great musician; was exceedingly fond of dancing; a shrewd, vivacious, and humorous letter-writer; a model aunt who delighted her nephews and nieces by improvising long stories. In the Steventon household there was much reading aloud of miscellaneous books of the day. The dining-room or a barn was sometimes turned into a theatre. Slow to publish, Jane Austen began to write at a very early age. Her tales, mostly ludicrous, 'had amounted to a considerable number by the time she was sixteen.' *Love and Freindship* (such is the spelling), published with other juvenilia in 1922, is of this time. A 'ratling bur-

lesque' of feckless fainting heroines and persecuted lovers, it exhibits her characteristics in astounding maturity. Like *Lady Susan* and other early writings it is in the form of letters, no doubt after the example of Richardson. At the age of twenty-one she began what is generally considered her best novel, *Pride and Prejudice*; but it cannot, as we have it, be considered early work. Publishers were loth, she herself fastidious and assiduous in revision, and all her works late in appearing. *Sense and Sensibility* 'by a Lady' was the first published (1811); *Pride and Prejudice* followed in 1813. *Northanger Abbey* was begun about 1798, and published posthumously in 1818. Apart from the fragment written about 1804, to which Mr J. E. Austen-Leigh gave the title of *The Watsons*, her work thenceforward seems to have been limited to revision until 1812, when she began *Mansfield Park*. It appeared in 1814, and its successor *Emma* in 1816. *Persuasion*, completed in July 1816, was published in 1818. A novel begun in 1817, and left unfinished, was published as *Sanditon* in 1925. The novels were written in the sitting-room at Steventon or Chawton. When a creaking door gave warning that a visitor not in the secret was approaching, a cover was hastily thrown over the manuscript.

Successor to Samuel Richardson and Fanny Burney, Jane Austen created the most characteristic type of the pure domestic novel. She drew her material from what she actually saw around her; her experience of life was limited, even monotonous. This and her own temperament determined her to a kind of novel-writing completely opposed to the *Udolpho* and *Monk* type then in vogue. *Northanger Abbey* is a deliberate parody of this style, though it is only intermittently parody; and it was unquestionably her conscious conviction that a true picture of ordinary life could be made as interesting as the tale of blood-curdling horrors and overdrawn sentiment, of daggers and bows, impossible disguises, incredible conjunctions, monstrous crimes, preternatural agonies and remorse. Incident is rare; romance is avoided. There is no attempt to startle with scenes of surprising daring or distress. She sets us down in country-house and cottage of gentility, and introduces us to an entertaining company who unconsciously lay bare their characters amid the ordinary incidents of daily life, and in marvellously lifelike and mercilessly revealing conversations. The details all aid in developing and discriminating her characters, who, if they do not throb and thrill with passion, have amazing vitality; they are presented with extraordinary dramatic truth and effect; 'every one says the right thing in the right place and in the right way.' 'Of all his successors she is the one who most nearly resembles Richardson in the power of impressing reality upon her characters.' She is amazingly deft in delicate ridicule of foibles and vanity. We do not find, we do not miss that morbid colouring of the stronger and darker passions which so many novelists of her time affected. The clear daylight of nature as reflected in domestic life is her genial and inexhaustible element.

As her genius was precocious, so it remained steady. Her style is throughout natural, quietly epigrammatic, unfailingly telling; her humour and insight sleepless, merciless, and yet kindly and free from all bitterness; her artistic sense sure. Hence there is not one of the six novels—unless it be *Sense and Sensibility*—that some readers do not consider her best. Witty brilliancy commends *Pride and Prejudice* most to some; exuberant high spirits *Northanger Abbey* to others. One critic points to the pure ironical humour of *Emma*; a second finds in *Persuasion* a ripening into a more mellow manner. Had she written fifty novels,

there would doubtless have been fifty opinions. Sir Walter Scott, after reading *Pride and Prejudice* for the third time, thus summed up Jane Austen in his diary with the authority of a master and with an unforgettable contrast: 'That young lady has a talent for describing the involvements of feelings and characters of ordinary life, which is to me the most wonderful I ever met with. The big *bow-wow* strain I can do myself like any now going; but the exquisite touch which renders ordinary commonplace things and characters interesting from the truth of the description and the sentiment, is denied to me. What a pity such a gifted creature died so early!' Macaulay wrote: 'I have now read once again all Miss Austen's novels; charming they are. There are in the world no compositions which approach nearer to perfection;' and declared that she approached nearest to Shakespeare in character-drawing—an opinion in which many others have followed him. Coleridge, Southey, and Sydney Smith were amongst her admirers, a representative trio. But none knew her literary character better than she did herself. He is 'the little bit (two inches wide) of ivory on which I work with so fine a brush as produces little effect after much labour.'

See her brother Henry Austen's preface to *Northanger Abbey* (1818); the memoir by her nephew J. E. Austen-Leigh, son of James Austen (1870; 2d ed. with *Lady Susan* and fragments, 1871), mostly incorporated in *Jane Austen, her Life and Letters*, by his son and grandson, W. and R. A. Austen-Leigh (1913); the *Letters* edited by Lord Brabourne, son of her niece, Fanny Knight (1894); reviews in the *Quarterly* by Walter Scott (1815) and Whately (1821); the *Life* by Oscar Fay Adams (1891); an essay by A. C. Bradley (*Essays and Studies of the English Association*, ii, 1911); *Personal Aspects of Jane Austen*, by Mary A. Austen-Leigh (1920); L. Villard, *Jane Austen* (trans. 1923); and R. W. Chapman's edition of the novels (1923).

Austerlitz, a small town in Moravia, 12 miles ESE. of Brunn. Here, on 2d December 1805, Napoleon defeated the combined forces of Russia and Austria, under the command of their respective emperors. The French amounted to 70,000 men; the allied armies to 95,000. In this disastrous battle—known as the 'battle of the three emperors'—the Russians lost 21,000 in killed, wounded, and prisoners, the Austrians 6000, and the French 6800. See Rose's *Napoleonic Studies* (1904).

Austin, capital of Texas, on the left bank of the Colorado River, at the junction of several railroads, 166 miles W. by N. of Houston. The river breaks through a range of hills upon which the city is built. The red granite State Capitol (1881-88), for the expenses of which three million acres of land were appropriated, is the largest State Capitol in the Union, and is reputed the seventh largest building in the world. Austin also contains the State University (1883), banks, state asylums, &c., and has a miscellaneous trade. It was named after Stephen Fuller Austin (q.v.). Pop. 35,000.

Austin, ALFRED, critic, journalist, and poet-laureate (in succession to Tennyson), born of Catholic parents at Headingley near Leeds, May 30, 1835. He was educated at Stonyhurst and St Mary's College, Oscott, graduated at the university of London in 1853, and was called to the bar in 1857. He soon turned to literature for a living. His first work was *Randolph* (1854), an anonymous poem full of sympathy for the Poles; but his first important book was *The Season: a Satire* (1861), which was so severely criticised, that its author felt it necessary to reply in *My Satire and its Censors* (1861). *The Human Tragedy* (1862) he soon recalled, but did not issue it in its altered form till 1876. Later volumes of verse are *Interludes* (1862); *Savonarola*, a tragedy (1881); *Solilo-*

ques in Song (1882); *At the Gate of the Convent* (1885); *Love's Widowhood* (1889); *Narrative Poems* (1891); *England's Darling* (1896); *The Conversion of Winckelmann* (1897). *The Garden that I Love* (1894), *In Veronica's Garden*, *Lamia's Winter Quarters*, *Haunts of Ancient Peace*, and *A Lesson in Harmony* (1901) are mainly in prose. In 1883-9., editor of the *National Review*, he twice stood unsuccessfully for parliament. In 1896 he was appointed poet-laureate. His *Autobiography* (1911) made mention of 18 volumes of verse and 7 of prose, besides journalistic and magazine work. He died 2d June 1913.

Austin, JOHN, was born at Creeting Mill, Suffolk, 3d March 1790; served in the army; but in 1818 was called to the bar. In 1820 he married Sarah Taylor of Norwich (see below), and went to live in Westminster. Compelled by bad health to abandon the bar when the university of London was founded (1826), he received the appointment of professor of Jurisprudence. To fit himself for the chair, he settled in 1827 at Bonn, and returned to England next year well acquainted with the writings of some of the most eminent of the continental jurists. His lectures were well received by a few distinguished men; but the subject was not recognised as a necessary branch of legal study. In the absence of students, Austin in 1832 was reluctantly compelled to resign his appointment. In the same year, he published his *Province of Jurisprudence Determined*, a work at the time little appreciated by the general public; in the estimation of competent judges, however, it placed its author in the highest rank among writers on jurisprudence. It dealt with the relations of ethics to law, and gave an admirable statement of utilitarianism, on which he based his system of morals. In 1833 he was appointed by Lord Brougham a member of the Criminal Law Commission. The post was not much to his taste, as he did not believe that the public received any advantage from such bodies. 'If they would give me £200 a year,' he said, 'for two years, I would shut myself up in a garret, and at the end of that time I would produce a complete map of the whole field of crime, and a draft of a criminal code.' Austin was afterwards appointed a member of a commission to inquire into the grievances of the Maltese. He returned to England in 1838, not in good health, and soon removed with his family to Germany, living at Carlsbad in summer, at Dresden and Berlin in winter. The revolution of 1848 drove him back to England, and he then settled at Weybridge, where he died in December 1859, universally respected for the dignity and magnanimity of his character. His lectures on the principles of jurisprudence were prepared for the press by his widow, and published after his death under the title of *Lectures on Jurisprudence* (1861-63). They and the earlier works, edited together by Mr R. Campbell, have passed through several editions.

Austin's great merit consists in his having been the first English writer who attached precise and intelligible meaning to the terms which denote the leading conceptions underlying all systems of jurisprudence. With a very perfect knowledge of the methods of Roman and English law, he displayed genius of the highest order in devising a novel system of classification for the subject-matter of his science. The work he did is incomplete, but it forms a sure foundation to future labourers in the same field. It is universally recognised as an enduring monument of learning and genius, and it entitles its author to take rank as one of the very few Englishmen who have made contributions of importance to the philosophical study of law. Austin said of himself that his

special vocation was that of 'untying knots'—intellectual knots; and so it was. He set himself to the task of exposing the errors hid under the phrases and metaphors current among writers on law, and this he accomplished with such skill and subtlety as to make his works models of close and sound reasoning. See Memoir of Austin prefixed to the *Lectures*, and an article on Austin in Mill's *Dissertations*.—Mrs AUSTIN (née Sarah Taylor), translator, was born at Norwich in 1793, and married John Austin in 1820, the only child of the marriage being Lady Duff Gordon (q.v.) A faithful and devoted wife, she spent many years with her husband abroad, and enjoyed the friendship of many of the most eminent persons in continental society. Mrs Austin translated from the German, Falk's *Characteristics of Goethe* (1833), Carové's *Story without an End* (1834), Ranke's *Popes* (1840) and *History of the Reformation in Germany* (1845); from the French, M. Cousin's *Report on Public Education in Prussia* (1834), and Guizot's *English Revolution* (1850). She herself was author of a pamphlet *On National Education* (1839); of *Germany from 1760 to 1814* (1854); and of *Letters on Girls' Schools and on the Training of Working-women* (1857). From 1861 to 1863 she was engaged in editing her husband's lectures from his manuscripts, a duty she discharged with very great ability. She died at Weybridge, 8th August 1867.—CHARLES AUSTIN, younger brother of John, was born in 1799, and educated at Bury and Jesus College, Cambridge. Called to the bar in 1827, and made a Queen's Counsel in 1841, he, during the railway mania, made an enormous fortune as a parliamentary lawyer, and in 1848 retired from practice. So this first of lawyers and most eloquent of Benthamites, Macaulay's rival as a conversationalist, who to Mill had seemed 'capable of dominating the world,' died, a country squire, at Brandeston Hall, in Suffolk, 21st December 1874.

Austin, STEPHEN F., founder of the State of Texas, was the son of Moses Austin, a pioneer in the same region, and in 1821 conducted a party of settlers to where the city of Austin now stands, thus carrying out a work his father had begun (see TEXAS). In 1833 Austin went to the city of Mexico to secure the admission of his settlement into the Mexican Confederacy, and was imprisoned there till 1835. He died in December 1836.

Austin Friars. See AUGUSTINIANS.

Australasia is a term etymologically equal to *Southern Asia*, but used to indicate Australia and the adjoining islands—Tasmania, New Zealand, Papua or New Guinea, New Caledonia, the New Hebrides, New Ireland, and New Britain. The term would thus exclude the Malay Archipelago, Micronesia and Polynesia proper; but some authors include these great groups of islands also, making the name therefore equivalent to *Oceania*. The 'Australasian Colonies,' however, in common parlance include only the Commonwealth of Australia and the Dominion of New Zealand. The several islands are discussed each under its own name; and for fauna and flora, see GEOGRAPHICAL DISTRIBUTION.

Australia, by far the largest island on the earth's surface (its size, indeed, almost entitles it to rank as a continent), lies between 10° 41' and 39° 8' S. lat., and between 113° 9' and 153° 39' E. long., having a maximum length, from west to east (from Steep Point to Cape Byron), of about 2400 miles; and a maximum breadth, from north to south (from Cape York to Wilson's Promontory), of 1971 miles; making a total area of 2,948,366 sq. m. (excluding Tasmania, 26,215), about one-fourth less than that of Europe, or nearly twenty-five times that of Great Britain and Ireland. It is

separated from New Guinea by Torres Strait, 90 miles wide, and from Tasmania by Bass Strait, 140 miles wide; on three sides it is washed by the Indian Ocean (now usually called the 'Southern Ocean east of Cape Leeuwin'), on the E. by the South Pacific. The distance from Southampton to its first port of call, Fremantle, is 9672 nautical miles *viâ* the Suez Canal and 10,670 *viâ* the Cape of Good Hope. From Sydney, the principal port on the eastern coast, London is distant 12,799 miles *viâ* Vancouver and 12,688 *viâ* the Panamá Canal.

The name Australia for this part of the earth's surface was first used by Captain Flinders in 1804, and formally adopted about 1817; but the word had already been used (to denote quite a different region) by Alexander Dalrymple in 1770, and the adjective 'Australian' was used in 1693 to denote inhabitants of the southern Pacific islands. For many years (up to 1849 at least) the mainland was officially known as New Holland, and 'Australia' was used to denote the British possession which included both the mainland and Tasmania.

The continent is exceedingly compact, with an almost unbroken outline on the east and west. Parallel with the east coast, at distances varying from 10 to 100 miles, stretches for 1200 miles the Great Barrier Reef, offering few safe openings for ships. From Moreton Bay in Queensland round by the north to North-west Cape in Western Australia, the encircling seas are comparatively shallow, as they are on the south between King George's Sound and Cape Howe; but along the east and west coasts the 1000-fathom line is not far from shore, and depths of 2500 to 3500 fathoms are found within 250 miles of the coast-line on the east, south, and north-west.

The lack of good river communication between the coast and the interior is remarkable. The mountains that rise to any great elevation are all on the east side; and but one important river, the Murray, penetrates the settled districts behind them, collecting into itself (by the Darling and other great tributaries) almost the whole inland drainage of that eastern range. The great rivers of the north and north-west traverse pastoral and but sparsely settled districts; and the minor ranges on the west side of the continent feed only a few short and often intermittent streams. A large expanse, between a narrow strip of occupied country on the west coast and the overland telegraph-line, seems to have no properly defined river-system. The lack of natural irrigation over this arid area is further aggravated by the enormous evaporation, which for long periods dries up such rivers as it possesses.

Physical Features.—The dominant physical feature of eastern Australia is the Dividing Range, which under many names runs almost parallel to the eastern coast from Cape York to Wilson's Promontory. 'Range,' however, is a misleading term; the area is really a wide tableland, often much dissected, with a steep face seawards and a long slow slope to the plains inland. In early geologic times its rivers seem to have flowed mainly north and south along its surface; but these older channels have in many cases been intercepted by those of short streams running east or west, leading (in the case of east-flowing rivers, fed by the plentiful coast rains) to deep excavation of the river-beds and the formation of the huge gorges so characteristic of Australian mountain scenery. Behind the tableland (which is about 200 miles wide in most places) lies a belt of alluvial plain, stretching from the Gulf of Carpentaria to the Southern Ocean, comparatively narrow (say 200 miles) in northern Queensland, but behind Brisbane extending over nearly 13 degrees of longitude. The rest of the continent, roughly speaking, is occupied by another

tableland, much less dissected because the rainfall is far scantier, which includes South and Western Australia and the Northern Territory; it throws out a tongue into western Queensland, and is invaded by a plain area at the head of the Great Australian Bight.

From the more or less complete dissection of the eastern tableland arise the 'ranges' and 'mountains' which diversify the map of Australia. The most important of them, both from its height and from its value as a source of water-supply, is the group of hills on the border of New South Wales and Victoria variously called the Munier Range, the Bowen Mountains, and the Australian Alps. In it lies the highest Australian mountain (really one of several knobs on a high plateau), Mount Kosciuszko (7328 feet), as well as several peaks of 6000 feet and over; and from it spring the headwaters or important tributaries of the Murray, Murrumbidgee, and Snowy rivers. A second high plateau occurs about the intersection of 30° S. lat., its highest point being Ben Lomond (5000 feet); the character of the 'range' may be guessed from the fact that a trunk railway line passes only 500 feet below the summit. In all the rest of the tableland only two hills exceed the 5000-foot level, and the average height is under 2000 feet. In the alluvial plain, especially in the New South Wales section, the map-marked 'ranges' are of a different kind, the remains of genuine fold-mountains almost buried in the result of their own denudation; they rarely rise beyond 1500 feet above sea-level, and about half that height above the plain. In the western tableland the only important range is the Macdonnell, in the centre of the continent; the Darling Range is merely the low western edge of the tableland, and the Mount Lofty range in South Australia seems to be a genuine fold-range superposed on a plateau. Along the seaward edge of the two tablelands occur long stretches of coastal plain, the alluvium of the eastern rivers, usually very fertile but awkward of access, which must be either by river-mouths blocked with bars or over the steep sides or spurs of the tableland. Australia's best natural harbours—Port Jackson, Port Curtis, Port Denison, and the like—are in regions where the tableland itself edges the sea, and therefore at some distance from the fertile districts; so that the transport of Australian products is doubly handicapped. Owing to peculiarities of soil-composition and climate, which will be discussed later, the settled area of the continent is almost wholly confined to its south-eastern portion—bounded, say, by a line from Rockhampton in Queensland through Forbes in New South Wales to Portland in western Victoria—and to districts adjacent to Adelaide in South Australia and Perth in Western Australia. The populational centre of gravity for the whole continent lies about half-way between Sydney and Adelaide.

The inland portion of this settled area is drained by the Murray and its tributaries, which comprise within their water-shed an area twice as large as France (more than 414,000 sq. miles). The Murray itself, rising in the Australian Alps on the border between New South Wales and Victoria, forms the boundary of those states until it passes from them into South Australia, and after a course of about 1600 miles loses itself in the shallow lagoon of Lake Alexandrina. On its southern or left bank it receives the northern drainage of the Victorian Highlands, its principal tributaries being the Goulburn (280 miles) and the Loddon (155). On its northern bank it receives the inland drainage of the great eastern tableland from as far north as 25° S. lat.—or rather what is left of that drainage after suffering enormous absorption and evaporation—through two channels, of the Murrumbidgee

(1050 miles) and Darling (1760); the Murrumbidgee brings with it the waters of the Lachlan (850 miles), and the Darling those of the Macquarie (590), Castlereagh (340), Namoi (430), and Gwydir (350)—in wet seasons also those of the Bogan (370) and Warrego (495). The Darling itself is the product of two large rivers, one known in different parts of its course as the Barwon or Macintyre, the other as the Culgoa, Balonne, and Condamine. (This multiplication of names is a not uncommon feature of Australian hydrography.)

The coastal slopes of the tableland are drained, for the most part, by short swift rivers of no great length; but the already mentioned interception by some of these of older north-south rivers has produced a few large streams—the Shoalhaven, Hawkesbury, Hunter, and Clarence in New South Wales, and in Queensland the Fitzroy and Burdekin-Belyando. The head-waters of the last two penetrate the tableland almost to its western edge and the line of 20-inch rainfall, thus depriving the west-flowing rivers north of 25° S. lat. of a large permanent water-supply; the northern section, therefore, of the great alluvial plain has no rivers of great importance.

Practically the whole of the western tableland (except its coastal edge) has less than 20 inches of rain per annum. Its river-system is therefore extremely vague and indefinite. A few intermittent streams drain into the western extension of the plains at Lake Eyre; to the west of that lies an almost waterless tract, containing a few shallow lake-beds usually dry; but round the coast, from the Gulf of Carpentaria to Geraldton in Western Australia, large rivers cut deep into the tableland's edge and provide areas of good pastoral country, stretching in some places 300 miles inland. Of these the chief are the Roper (260) and Victoria (350) in the Northern Territory, and the Ord (300), Fitzroy (325), Gascoyne (475), and Murchison (440) in Western Australia. The Perth district reverts to the east-coast type of tableland; but along the southern coast, from King George's Sound to Spencer Gulf, there is no seaward drainage worth considering.

Australian lakes, apart from a few small glacier-formed lakes in the Australian Alps, are either lagoons along the coast, with permanent or intermittent connection with the ocean, or large shallow depressions into which the inland streams pour their flood-waters. One of the latter—Lake George, in New South Wales—lies actually on the summit of the eastern tableland, in a region of steady rainfall, and dries only after periods of sustained drought; the others, whether on the alluvial plain (such as those lying along the Darling, and the great South Australian group) or on the western tableland, are more often dry than full.

Professor Sir T. W. E. David announced in 1921 that there are two main artesian basins in Australia—the smaller extending from a line Cloncurry-Hughenden (in Queensland) northwards to the Gulf of Carpentaria, the larger from Winton (Queensland) west to Lake Eyre. Underground circulation, which keeps the artesian water comparatively fresh, is maintained by a gigantic leakage towards Lake Eyre, which would form surface lakes but for the immense evaporation of central Australia. There are artesian possibilities in the Nullarbor Plains at the head of the Bight.

Geology.—This subject is treated in greater detail under the names of the different States. According to Professor Gregory, the general structure of the continent has been determined by the existence of two great blocks of Archæan rocks, the larger being the core of the western tableland already described, the smaller occurring in north-eastern Queensland. Against the larger, in middle Palæozoic times, more yielding strata were pressed

and folded into a series of ranges which ran from the Kimberley district, on the north-west coast, to the southern point of Tasmania; and these ranges, suffering denudation from the first, were in Cainozoic times also subjected to a good deal of faulting. To this faulting the different levels of the eastern tableland seem due, although its whole area from Cape York to Tasmania seems to have been uplifted at the same time. Roughly speaking, the eastern tableland at its southern end is composed of Ordovician and Silurian rocks on an Archæan base, which has been elevated through them at Mount Kosciusko. These extend northwards to the boundary between New South Wales and Queensland; under Sydney they drop 3000 feet and more to form a great basin in which the Permo-Carboniferous coal-fields were built up, and on either side of the New South Wales-Queensland boundary they hold in a shallower basin strata (including coal-seams) of Trias-Jura age. Thence northwards to lat. 21° Carboniferous formations predominate, abutting there on the Archæan rocks already mentioned. The great alluvial plains north of the Darling-Macquarie line are Cretaceous, south of it largely Eocene; round Cobar, in the north of the Tertiary area, occurs a much-worn plateau of Silurian and Devonian age. The western tableland is markedly Archæan, overlain in the Northern Territory and the Kimberley district by Cambrian and Ordovician strata, and at the head of the Bight by marine Cainozoic beds, largely limestones. Along its western edge occur Triassic and (north of 26°) Carboniferous beds; along its south-eastern edge, from near Lake Eyre to St Vincent's Gulf, lies a mass of rocks of Cambrian age.

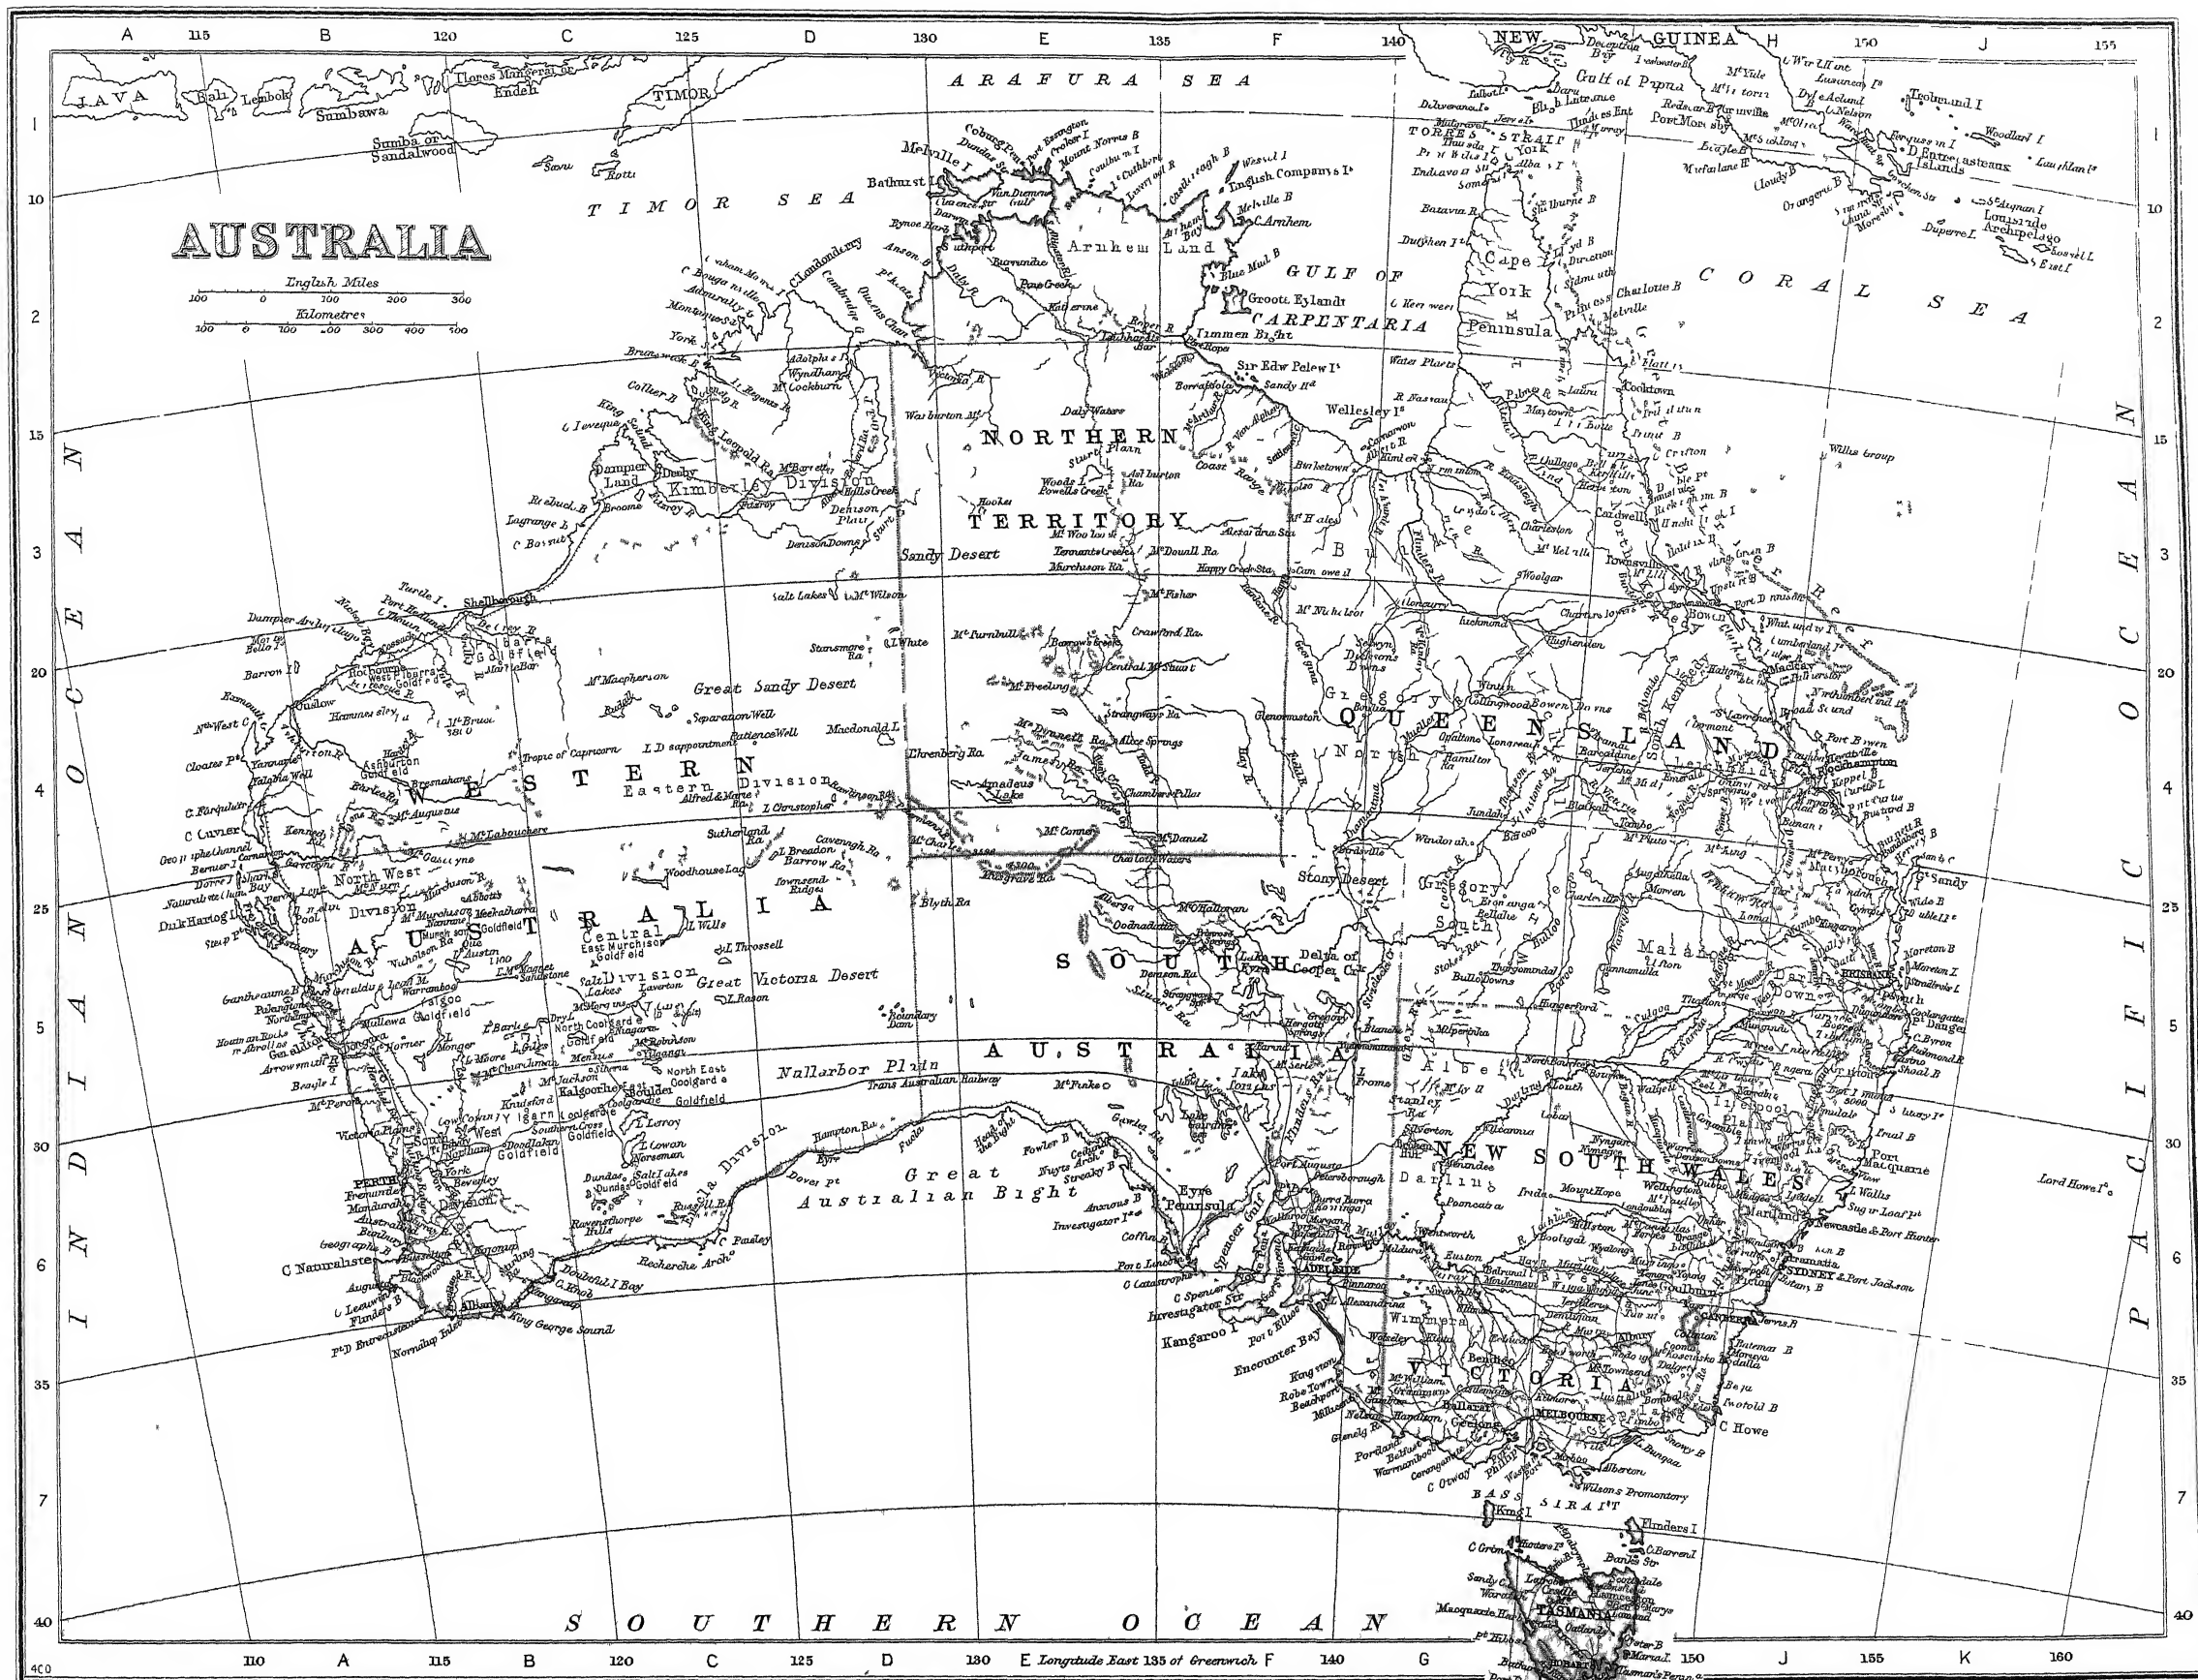

Australia has no active volcanoes. But the evidences of past volcanic action are numerous and widespread. Along the southern edge of the eastern tableland, from Melbourne west across the South Australian border, extend the 'Newer' (Pliocene and later) Basalts, and extinct craters are plentiful, Mount Gambier being probably the best known. In New South Wales 'nearly every period belonging to the Palæozoic era had its active volcanoes; . . . in the Cainozoic era renewed activity took place; . . . the late Tertiary cones, although they have suffered considerable denudation, still remain as evidence of the great eruptions which produced them' (Süssmilch). In Queensland also the Tertiary outflows were extensive. In the western tableland the only considerable volcanic deposits occur in the Kimberley district and on the Victoria River; but there is a basalt outcrop at Bunbury on its south-western edge, and another on Kangaroo Island, south of Adelaide. Evidence is now also forthcoming of earlier (andesitic) flows in the area between the Murchison and De Grey rivers.

Although no part of the Australian continent is at present included within the permanent snow-line, there is adequate evidence of at least three glacial periods affecting its surface—a Pleistocene period, during which the whole of the Kosciusko plateau on the mainland and the west coast ranges of Tasmania were under ice; Permo-Carboniferous glaciations that affected central and northern Victoria, quite half of Tasmania, a large area in South Australia between the Murray River and Spencer Gulf (including the northern part of Kangaroo Island), part of the Hunter River valley in New South Wales, and a long stretch of coastal country in Western Australia between latitudes 23° and 29°; and a Cambrian period of which traces have been discovered only in South Australia, over an area of 90,000 square miles north and east of Adelaide. The evidence for these periods, most of which has been procured very recently, is set

forth in the Commonwealth Official Year-book for 1920 (No. 13), on pp. 1133-46.

Minerals.—Gold is distributed through all the states, though very little is found in South Australia. The principal fields are in Western Australia, whence comes more than half the total yield of the Commonwealth. Diamonds of small size but commercial value are found in New South Wales, sapphires in Queensland, and topazes in the tin drifts of New South Wales and Tasmania; but the only gemstone which supports an important industry is the precious opal of the Cretaceous plains in western New South Wales and Queensland. The Permo-Carboniferous strata of New South Wales are the most important source of the Australian coal-supply. The coal-fields of that state cover an area of about 16,550 sq. m., and are estimated to contain an available supply of more than 115,000,000,000 tons; they include also extensive deposits of kerosene shale. Coal of commercial value (Jurassic) is worked in South Gippsland in Victoria, in which state deposits of brown coal and lignite also cover huge areas. Trias-Jura coal (black) is mined in southern Queensland; and in the central district along the Mackenzie and Dawson rivers Palæozoic seams occur, yielding good anthracite. Mines are also worked in Tasmania, and in the south-west corner of Western Australia. Queensland produces nearly half the copper of Australia, chiefly from the fields at Mount Morgan on the tableland and Cloncurry in the northern plain; New South Wales (Cobar) and Tasmania (Mount Lyell) are also large producers; the once famous fields of South Australia have now sunk into comparative insignificance, but account for nearly half the total yield since their first discovery. The silver-lead mines of Broken Hill in western New South Wales are among the most productive in the world; they have yielded over 104 million pounds' worth of silver and lead, and have paid away nearly £22,000,000 in dividends, while still producing at the rate of £5,000,000 worth of output a year. Tin (from northern New South Wales, north Queensland, and western Tasmania) and zinc (from Broken Hill) are also mined to the value of more than £1,000,000 a year in each case. Great deposits of iron exist in all the states, but little use has been made of them; however, the Commonwealth is encouraging the industry by a bounty, and foundries at Lithgow and Newcastle (New South Wales) are dealing with local ores from that state and from the Iron Knob in South Australia, near Port Augusta, where it is estimated that 21,000,000 tons are in sight. Other metals and minerals obtained in commercial quantity are antimony (New South Wales and Victoria), bismuth (Queensland), molybdenite (Queensland), salt (South Australia), scheelite (New South Wales), and wolfram (Queensland and New South Wales); New South Wales also has an important cement industry. Platinum, osmiridium, radium, tantalum, and uranium, as well as alunite and fuller's earth, are known in quantities that will probably repay serious development.

Climate.—Australia, lying mostly within the temperate zone, enjoys on the whole an equable climate, and is, latitude for latitude, cooler than the rest of the world. The extreme range of shade-temperature is, over the greater part of the continent, only 81°—half that of North America and northern Asia; while the 70° isotherm, which in South America and South Africa reaches lat. 33° S., in the Mediterranean about 35° N., and in Asia and North America about 40° N., extends in Australia only to 30° S. The ranges of mean summer and winter temperature are greatest inland, especially in the north-western part of the continent, where (in the upper basin of the De Grey River)

the shade-temperature sometimes exceeds 100° for weeks together. At Port Darwin, on the other hand, the difference between means is only 8·6°, and that between extreme temperatures is less than 50°. Regular observations of relative humidity have been carried on only at the state capitals, of which Sydney and Hobart are the most humid (90 per cent. and over in winter), and Adelaide the driest (below 30 in late spring and summer). Evaporation in the coastal areas varies from about 66 inches annually at Perth to 32 at Hobart; but inland figures far exceed these—84 in western New South Wales, 87 at Coolgardie, 97 at Alice Springs in the centre of the continent, and 146½ at Laver-ton, about 200 miles north of Coolgardie.

The official climatological divisions of Australia are, roughly speaking: (I.) Western Australia; (II.) South Australia with the western parts of Queensland and New South Wales; (III.) central and eastern Queensland, plus New South Wales north of the Darling; (IV.) New South Wales east of the Darling and north of the Murrumbidgee; (V.) Victoria and other areas south of the Murray and Murrumbidgee, including Tasmania. These areas are designed so that each includes at least one of the state capitals, at which important meteorological stations exist; but it is obvious that the results obtained in seaboard towns do not necessarily bear any relation to the facts of climatology inland.

Winds.—The most important permanent wind-currents affecting Australia are the south-east trades and the westerlies which blow along the Southern Ocean. The trades, following the sun, in winter operate only north of the tropic of Capricorn; in summer they are felt as far south as 30° S. lat. Conversely, the westerlies, which in summer scarcely touch the continent at all, in winter blow across the southern coast-belt, and sometimes are felt almost as far north as the tropic. Between the two currents lies the path of a great anti-cyclonic stream, a series of vast elliptically-shaped bodies of circulating atmosphere, measuring frequently 3000 miles in their major and 2000 in their minor axis (H. A. Hunt). Between these bodies occur V-shaped depressions running inland from the Southern Ocean, and bringing with them cold rain and boisterous winds. Monsoonal depressions, bringing rain in from the warm northern seas, also occur, but more capriciously.

The winds inland are further affected by the comparative aridity and barrenness of the central tableland, hot under the blazing sun of summer, over cold in winter (at Alice Springs the mean maximum for December is nearly 100°, the mean minimum for July under 40°). This causes a spiral circulation from the coast inwards during summer, from the centre outwards in winter.

Among exceptional winds may be noted (a) the cyclonic storms of winter, produced along the southern coast by the passage of the V-shaped depressions—Bass Straits especially suffer from these; (b) the summer hurricanes of the north Queensland coast, luckily but occasional visitors from the island groups of the western Pacific; (c) the 'Willy-Willies' of NW. Australia, also summer visitors, which originate apparently on the ocean near Cambridge Gulf and travel south-westerly along the coast, displaying particular violence between the De Grey and Ashburton rivers. On the east coast, especially on that of New South Wales, a peculiar cycle of winds also deserves notice; the usual routine begins with a change from the ordinary north-easterly wind of the summer months to a dry, hot westerly, which lasts from six to twelve hours, and is then succeeded by a sharp inrush of much colder wind from the south. In the neighbourhood of Sydney this cycle is so regular that the passage of the southerly up the coast is

officially signalled from the tower of the post-office to a population sweltering in the westerly heat. In midsummer the cool winds last no longer than the dry, hot ones, and the warm, damp north-easter comes back in a few hours; in spring and autumn, however, a southerly may last three days, maintaining cool and often wet weather all the time. The variations of temperature thus produced are trying, if grateful; the westerly raises the temperature ten to twenty degrees (though its dryness usually makes even the excess of heat more bearable than had been the long-continued warmth of the prevailing north-easters); the southerly brings with it an instant drop of equal or greater extent, and an eventual drop of thirty to forty degrees below the highest point reached just before. Professor Gregory's explanation of the cycle postulates a hot westerly (a return trade-wind) blowing steadily during the warm months at a high level over Sydney; whenever exceptional heat in the tropics cuts off the low-level inflow from the ocean (the north-easterly), this hot inland wind drops on to the coastal plain, but is soon extruded by the arrival of a cold wind from the Antarctic, which has been brought up by the same exceptional tropical heat.

The rainfall of Australia is, of course, determined mainly by the winds and air-systems already described. The south-east trades bring to the Queensland coast rarely less than 50 inches per annum, and at Innisfail, or Geraldton (lat. 17½°) the average mounts to 160 inches; the westerlies of the Southern Ocean maintain a steady 30-inch average in the south-western corner of Western Australia, and in eastern Australia south of lat. 36°. Inland the rains are mainly sucked in from the surrounding seas by the anti-cyclonic stream, or thrust in by the depressions. If a line be drawn from Sydney north-west to the Ashburton River in Western Australia, it may be said that north of that line is the region of summer rains (January to March), south of it that of winter rains (June and July); a narrow strip in southern Gippsland, Victoria, is exceptional in having its greatest rainfall in October. The driest part of the continent seems to be round Lake Eyre in South Australia, with an annual average of 5 inches; the 10-inch line includes all the area between the tropic and the Bight, east as far as the Darling River, west to and across the chief gold-fields of Western Australia; the 20-inch line takes in all Western Australia except its south-western corner and the Kimberley district, and nearly all the western tableland and the plains south of lat. 18°. The 20-inch area is bounded on the north from Broome (Western Australia) to the Gulf, and on the east down as far as Kosciusko, by a broad belt of country (chiefly foot-hills of the main range on the east) with from 20 to 30 inches; and that again by a narrow belt, mostly high land, with from 30 to 40. Higher averages occur only near the Leeuwin, in the peninsulas of the Northern Territory and Cape York, and along the eastern coast; the highest, as already mentioned, are recorded in the Innisfail district south of Cairns, where (at Goondi) the average is 166 inches, and in 1894 241½ inches fell. The following table has interest:

Rainfall.	Area of Commonwealth.
Under 10 inches	87 per cent., roughly.
10-15 "	20 " "
15-20 "	12 " "
20-30 "	18 " "
30-40 "	7 " "
Over 40 "	6 " "

Among exceptional rainfalls may be mentioned 22½ inches in 24 hours, a little south of Sydney in 1898; 35½ inches in the same time, a little north of Brisbane in 1893; and 27½ and 30½ inches, at

places in the Innisfail district in the summer of 1911. At Whim Creek near Cossack, in Western Australia, 29½ inches was recorded in 1898—a remarkable record in so dry a district. Snow has been seen as far north as lat. 31°; in the Kosciusko district it covers large areas every winter, so that winter sports are regularly organised, and from the ravines surrounding Mount Kosciusko itself it never disappears. Droughts are of less common occurrence than is usually supposed, and are always local; even in the great drought of 1902, the worst known since 1827, the greater part of Western Australia had copious monsoonal rains. 'A good coastal season,' says the Commonwealth Meteorologist, 'ordinarily depends upon an anticyclonic control; when such exists, the country west of the tableland' (i.e. the eastern tableland) 'usually wants water.'

Botany.—The vegetation of Australia, as might be expected in a country ranging over so many degrees of latitude and varying so greatly in rainfall, is of an extremely varied character. The bulk of it is purely Australian, and many genera are of primitive type, existing elsewhere only as fossils. There are evidences of a long-past connection with South Africa, and northern Queensland—though not the Northern Territory—possesses many forms of Malayan origin; otherwise the flora is practically unique.

The amount of vegetation naturally varies with the rainfall. Along the eastern coast and inland to the western foot-hills of the main range extends a well-timbered region; as the rainfall lessens the character of the timber varies, from the soft woods (pine, cedar, &c.) of the great coastal 'brushes' to the hard woods (mainly eucalypts) on the range and foot-hills. In Western Australia the important forest belt is, however, on the inland side of the main range, the jarrah and karri (two eucalypts) being its chief constituents. Where the rainfall is under 20 inches, forest growth ceases and the 'scrubs' of the plains begin, masses of shrub eucalypts covering large areas of dry but otherwise fertile country; behind them come stunted and scattered trees and scant herbage, and in the central area three notable plant-forms—saltbush (*Atriplex* and *Rhagodia*), 'spinifex' (*Triodia*), and nardoo—the two former valuable as fodder in drought-time, the last a cryptogam (*Marsilea*) much used by the aborigines for food. The coastal forests have a dense undergrowth; on the ranges this largely disappears, and among the foot-hills lie noble expanses of rich pasture-land patchily timbered with fine trees, while the edges of the great plain are diversified with belts of pine (*Callitris*) of some commercial value. Two marked features of the vegetation throughout Australia, except in the few regions of heavy annual rainfall, are the aromatic scents of the foliage, particularly on warm nights—'the velvety scents,' says an Australian writer, 'that come from a wine-vat freshly filled with must;' and the habit in trees and shrubs, especially common among the eucalypts, of turning the leaves edgewise to the sun. In Tasmania even English oaks have been noticed to adopt this habit.

One hundred and forty-seven natural orders are represented in the Australian flora, and over nine thousand species. The most important and widespread genus—*Eucalyptus*—contains 230 species, which range from 2 to 320 feet in height (a long-believed legend told of gums over 400 feet high, but this has been disproved, and the admitted record stands at 326 feet—*Eucalyptus regnans*, a Gippsland species). Gum timber is usually interlocked, and varies in colour from the pale cream of well-watered districts through pink and red to the cigar-brown of the arid Western Australian tableland; the bark varies also from the smooth, white,

thick covering of the trees generally called 'gum' trees through the 'ribbony' gums (*E. viminalis*) to the fibrous peppermint and stringybark, and the exceptionally hard ironbark (*E. paniculata*, *crebra*, and other species). The English names, it must be noticed, are applied vaguely to different species in different districts. Among other notable plant-forms are the wattles (*Acacia*), the most characteristic flowering shrubs of the tableland bush, their flowers being often used as the emblem of Australia; myalls, the wattles of the plain; 'honeysuckles' (*Banksia*), shrubs and trees with toothed leaves and bottle-brush flower-spikes, very full of honey; waratahs (*Telopea*), shrubs of the eastern ranges with large crimson flower-heads that glow like lamps along the bare ridges of the Blue Mountains; boronias, with tiny but very sweet-scented blossoms, heaths (nearly all *Epacris*), and the splendid 'Sturt's Desert Pea' (*Clianthus*) of the inland plains. There is also a wealth of flowering trees, many of them eucalypts, especially in Western Australia; the Queensland tulip-tree (*Stenocarpus*), the Illawarra flame-tree (*Sterculia*), and the Western Australian fire-tree (*Nuytsia*), all with gorgeous crimson or orange-coloured flowers, well deserve their names.

Among timbers of commercial value may be noted the ironbark and other eucalypt hard woods of the eastern tableland, the jarrah and karri of Western Australia, and the New South Wales turpentine (*Syncarpia*), which is much used for bridge-piles; of soft woods the Moreton Bay pine (*Aracaria*), the cypress pine (*Callitris*), the red cedar (*Cedrela*), and the red and black bean (*Dysoxylon* and *Castanospermum*) are the principal. Furniture woods are abundant and very varied—rosewood and silky oak in the east, sandalwood in the west, and blackwood (*Acacia melanoxylon*) in Victoria and Tasmania being the most noteworthy. The use of Australian fine-grained woods for ornamental furniture, parquetry, &c. has yet to be thoroughly developed.

Zoology.—According to Wallace, Australia was isolated from the rest of the world in Mesozoic times; and though there is evidence of a later land-connection with Asia, and of a land-bridge of some sort to South America (possibly through Antarctica, possibly along the line now marked by the Polynesian island-groups) that may have been late Mesozoic or early Tertiary, yet the Australian fauna has a markedly Mesozoic character. Neither cats nor pigs—families which exist everywhere else in the world—are found in Australia; its land mammalia consist of one dog, a few rats and bats, a large number of highly differentiated species of marsupials, and two remarkable monotremes. These, the platypus and the spiny ant-eater, are the most primitive mammals now in existence. The platypus (*Ornithorhynchus*, q.v.) is a mole-like animal, with a soft muzzle resembling in shape a duck's bill, found in eastern Australia as far north as the tropic; it lays soft-shelled yolk-bearing eggs at the end of long burrows excavated in river-banks, with an entrance under water. Its descent is traced from Theriodont reptiles, which became extinct in early Mesozoic times. The ant-eater (*Echidna*, q.v.) is a sort of porcupine to look at, about 20 inches long; it is a great burrower, simply disappearing into any soft ground on which it is laid; its eggs are hatched out in a temporary pouch something like that of a marsupial. Another variety of ant-eater and two species of an allied genus are found in New Guinea. The marsupial animals are provided with a permanent pouch in which the young are carried; among the more interesting are the grass-eating kangaroo and wallaby, the root-eating wombat, the carnivorous 'native cat' (*Dasyurus*), Tasmanian 'tiger,' and Tasmanian

'devil,' the leaf-eating 'opossum' and 'native bear,' and the omnivorous bandicoot. The marsupial anteater of the western tableland has fifty-four teeth, which seems a record. The Australian 'opossum' (*Phalanger*), the value of whose skin as fur has brought about a lamentable decrease in its numbers, must not be confused with the true or American opossum, which is a relative of the 'native cats.' The so-called 'flying squirrels,' which are not squirrels and cannot fly, are species of the 'opossum' possessing extra folds of skin between their limbs that act like the wings of a monoplane and allow them to glide from tree to tree.

Australian birds, as might be expected, are by no means so peculiar to the continent as are the mammals; but the emu, widely spread over Australia, and the cassowary of northern Queensland and New Guinea, are found nowhere else in the world; nor are the well-known lyre-birds of eastern Australia, which have been so destroyed for the sake of their beautiful tails that they can now be seen only in unfrequented valleys and after great precautions taken. Other characteristic birds are the mound-builders of the plain-scrubs, which hatch out their eggs by burying them in mounds of decaying leaves; the lorries or lorikeets, which travel in flocks from place to place, following the flowering of the honey-yielding eucalypts; the honey-eaters, many of which (e.g. the gill-birds and wattle-birds) are shot for a food-delicacy; the migrant mutton-birds of the southern coasts, which once saved the little colony at Norfolk Island from starvation, and so prevented the abandonment of the parent settlement at Sydney; the innumerable varieties of parrot, cockatoo, and parakeet; and the giant kingfisher or kookaburra, famous under the name of 'laughing jackass,' a gregarious snake-killer whose 'laugh' (though occasionally heard at other times) is its usual form of conversation with its mates on the roost at night and morning—wherefore the early colonists called it the 'settlers' clock.' The legend fostered by townfolk that Australian birds are songless—derived, apparently, from a misunderstanding of an exaggerated phrase of Gordon's—is quite inaccurate. At morning and evening the bush is full of song; and the notes of the crow-shrike ('maggie'), bell-bird, and coachwhip-bird, and the mimicry of the lyre-bird, are particularly notable.

Reptiles include two crocodiles in northern Australia, tortoises whose nearest relatives are found in South America, 390 kinds of lizard (including a unique legless family), and about 100 snakes. About a quarter of these—pythons, carpet and tree snakes mostly, ranging up to 15 feet in length—are harmless; the rest are poisonous theoretically, but only a very few are dangerous to man. The tiger-snake is said by scientific authorities to have the strongest venom of any known snake; but it secretes so little, and its teeth are so short, that the danger is minimised. It has been known, however, to attack man, which no other Australian snake will do unless cornered. Amphibia are mainly represented by tree-frogs; one species (not arboreal) has acquired the habit of distending itself enormously with water and living through droughts in a cake of dried mud. Indigenous fresh-water fish are few, the Murray cod (*Oligorus*) being the best known; a Queensland mud-fish (*Ceratodus*, q.v.) owns a lung in addition to its gills, and breathes air direct, especially when it finds the water too foul; the belief that it can live in the mud of dried-up ponds lacks confirmation. Both the fishes and the worms of Australia emphasise the old connection with South America. The insects have not yet been thoroughly studied. Beetles and ants abound, the former in about 20,000 species; butterflies are much rarer, except in northern Queensland,

where the numerous Papuan species have spread. Of the marine fauna, which on the whole is not specially distinctive, the most interesting genera are the Port Jackson shark (*Cestracion*), a survival from Mesozoic times, and the killer-whale (*Orca*), which helps the fishermen of Twofold Bay to capture its more useful relatives. Among edible fishes the principal are the schnapper (*Pagrus*), flounder (*Ichthobosolea*), garfish (*Belone* and *Hemirhamphus*), and jewfish (*Sciaena*), some of which run up to 100 lb. in weight.

The native fauna and flora have been considerably disturbed, and in some cases almost extirpated, by acclimatised importations. Of these the rabbit, fox, brown and rainbow trout, house-sparrow, and sweetbriar have made themselves most at home. As with the flora, the English names of Australian animals are vaguely applied in different districts to entirely different creatures; this is particularly noticeable among snakes and fishes. It is necessary, therefore, for the sake of cleanness, to add in nearly all cases the generic name at least of the animal under description.

Aborigines.—Like its flora and fauna, the human natives of Australia are isolated and peculiar, separated by a wide remove from the Papuans, the Malays, and the Negroes. This isolation is not only racial; their way of life also is unique. Nothing is more common—or more condemnable—among writers on Australia than the careless adoption of ill-informed and unobservant descriptions of the 'blackfellow' given by early white settlers. Given a community cut off from the world while still in the hunter-stage of civilisation, and pent in a country none of whose animals lend themselves to domestication, it is hardly possible to conceive a way of living more skilfully and intelligently adapted to the environment than is that of the native Australian uninfluenced by the white invasion. Of a dark coffee-brown complexion, rather than actually black, the Australian stands not much short of the average European in height; his body and arms are usually well developed, but his legs are very lean and destitute of calves (a defect common to dark races). His head is long and narrow, with a low brow prominent just above the eyes, but receding thence in a very marked degree. The nose, proceeding from a narrow base, broadens outwardly to a somewhat squat end, the eyes on either side of its thin root appearing drawn together. The face bulges into high cheek-bones. The mouth is big and uncouth, the jawbone contracted, the upper jaw projecting over the lower, with large white teeth; the chin cut away, the lips coarse and flexible. The whole head and face, and often the whole person, is covered with a profusion of hair, which, when freed of its usually enclogging oil and dirt, is soft and glossy—silky, not woolly. His ears are rather pricked forward. The effluvium of his skin, noticeable in itself, is exaggerated by the fish-oil he uses to anoint his person. The intellect of the Australian, directed mainly to the means of procuring food, operates almost exclusively within the range of the bodily senses, and inside that elementary sphere displays no little nimbleness and skill. He is unsurpassed in tracking and running down his prey; and his weapons, though of the most primitive kind, are well adapted to assist him in that purpose, whilst his rude culinary and domestic apparatus manifests equal skill, and his choice of foodstuffs is almost that of an epicure. His uncouth but intelligent notions of art may be observed in the crude drawings of animals carved or painted on rock surfaces all over Australia—most artistic, curiously enough, among the wildest tribes. He has no architecture, almost no weaving, and no pottery; some authorities allege that he has no religion, but this can only be justified

by identifying religion with theism. He is capable of loyal affection and gratitude, and is hospitable within limits. Without doubt blackfellows have often murdered Europeans, but in many cases this was more or less legitimate reprisal for prior atrocities committed by the convicts or other reckless Europeans; in many others it was due to unconscious infringement by settlers of the native laws, as when an intruding white man shot kangaroos on a tribe's hunting-ground, and then objected to the natives spearing his cattle depastured in the same locality. Where caves abound some of the tribes seek no father, but live in those ready-made tenements. None of them have fixed habitations; at best, only a screen of twigs and bushes covered with foliage or turf; sometimes, however, logs of wood and turf to serve for a few days' or weeks' shelter, till the pursuit of food calls them elsewhere. This is but natural; they know where and when certain sorts of food are in season, and regulate their journeyings accordingly. But they are not, as some writers declare, thiftless or improvident: they husband their provisions most carefully on a journey, and in certain cases prepare and preserve food when it is plentiful with great industry and foresight. The 'gin' is bound to keep her man in vegetable-food—roots of wild yam, seeds of acacia, sophora, leaves of the grass-tree, &c.—and if she fail to produce enough, she may be punished severely; but such methods of enforcing discipline are comparatively rare, and the ill-treatment complained of by gins whose tribes live near white settlers generally turns out to have been caused by more serious lapses from good conduct.

The blackfellow's weapons and implements, before white men provided him with theirs, were exclusively of wood, stone, or bone. The chief weapons are clubs, spears, and boomerangs—the last-named flattish curved bars of hardwood from 3 to 6 feet long, with a slight twist lengthways which steadies them in flight. Men and kangaroos can be badly damaged by their blow, and smaller animals killed outright. Lighter and more brittle boomerangs, made purely as toys, will return to the thrower, curving high in the air. Spears are either thrown or thrust with; in northern Australia the throwing-stick (*woomera*) is used to send them farther, faster, and straighter. Of implements the chief is a stone axe, neolithic in character; stone knives, mills, grindstones, and flint-chisels are also common. For obtaining food nets of native flax, woven with wooden needles, are used—all over the continent for fishing, and in the north also for trapping emus and pigeons; fish are also trapped by weirs, which are the only permanent constructions the aborigines have left.

Their social life is of extreme complexity and interest. Its bases can scarcely be described in such an article as this, but should be studied in the books mentioned at the end. Roughly speaking—for the many tribes have been so long isolated in their districts that all manner of diversities have crept in—the camp-council, swayed by the elders of the tribe, is the ruling body; so-called 'kings' are an invention of the unintelligent European. Tribes usually keep to particular districts, and have a friendly understanding with neighbouring tribes; but the normal attitude of a tribe to all others except its special friends is that of armed neutrality. Inter-tribal warfare is, however, very rare nowadays. Private quarrels are settled by personal combat, but not to the death, since murder is a serious public injury punished by the tribe. Social status depends entirely on age and on the passage through certain initiation ceremonies; the full number of these is four, but the higher ceremonies seem to be dying out, and very little is known of their details. The first only—

that consequent on the approach of puberty—is compulsory, since no uninitiate may marry. Personal relationships are governed by an elaborate code. The child belongs to the same camp as its father, but may have relatives in many other camps through its mother's connections; names denoting relationship are group-names—i.e. 'mother' means not only the actual parent, but her sisters and connections along a certain line; and every woman in a certain group is potentially the wife of every man in another group, irrespective of their particular camps. The 'totems' of individuals are connected sometimes (e.g. in NW. Queensland) with these marriage-groups, sometimes (e.g. in central Australia) with purely accidental occurrences; this divergence, like many others, seems to have arisen from very early separation of the immigrating tribes, which will be referred to later on. For further details, see MARRIAGE, TOTEMISM, and similar articles.

Owing to the long-continued isolation of the tribes, the one language which (with exceptions to be noted later) seems to have been originally common to all has been converted into an enormous number of dialects. Thus in a Queensland district less than three hundred miles square are found seven very distinct dialects, one of them with two sub-dialects and one with five. Belief in an original unity is based partly on the similarity in nearly all dialects of the words denoting certain parts of the body, and a few pronouns and numerals, partly on the grammatical devices—especially the wide use of suffixes—common to practically all tribes. At the same time the actual vocabularies differ so greatly that only neighbouring tribes can understand each other. Along the northern edge of the continent, however (Cape York Peninsula, the Gulf coast, the Northern Territory, &c.), both the words for simple things and the grammatical devices differ greatly from those used farther south, as well as among themselves; e.g. prefixes take the place of suffixes. While no definite connection can be established, it seems probable that the original Australian language was akin to the Dravidian languages of southern India, while the variations in northern Australia are due to considerable admixture of Papuan and even of Andaman elements. All the dialects are very poor in abstract terms and numerals, very elaborate as regards personal names and grammar. The sounds *s*, *f*, and *z* occur only in the northern dialects; *v* and *h* are very rare. In many tribes an extensive sign-language has been developed. It is interesting to note that a great many of the southern tribes take their names from their word for 'No'—the Kamilaroi using *Kamil*, the Wiradhuri *Wirrai*, and so on.

The now generally accepted theory about their origin is that they are an early offshoot of the Dravidian stock which was thrust into and along the Malay Archipelago by stronger tribes, migrated to northern Australia, either across Torres Straits or by a longer sea-voyage over the Arafura Sea, and spread over the continent in three main streams—one along the north-western and western coasts, one (which retains most fully the primitive customs) into the centre, and the largest along the eastern coast and highlands, right round the continent to South Australia. The commonly given estimate of 150,000 as the number of aborigines in Australia when Europeans first settled in it is merely a guess, no evidence of any kind existing. It is possible that 100,000 may be there now, mostly in western Queensland, the Northern Territory, and Western Australia; at the census of 1911 20,000 were recorded as living within the bounds of white civilisation.

All this information must be taken as the best

available approximation to the facts; more camps and tribes conform to the description than do not. It is difficult to make any statement regarding them which is universally true; e.g. a few central Australian tribes have definite headmen—though their authority is very vague—chosen on the hereditary principle, whereas among the mass of tribes that principle is quite unknown. Nothing but careful study of the latest and most experienced authorities on the subject can give the reader accurate knowledge of details.

Discovery and Settlement.—The exact date when Australia was first discovered by Europeans will probably always be an insoluble problem. It has been asserted that a coast-line marked on a British Museum *mappa mundi* must be that of Western Australia; indeed, some authorities declare that an allusion by Lucian (150 A.D.) to animals that 'use their belly like a pouch' must have been inspired by sailors' talk of the kangaroo. In 1526 the Portuguese were in New Guinea; if, as is likely, they during the next few years discovered northern Australia, Spanish claims to the Moluccas and all lands east of them (see the Weimar map of 1527) would keep the discoverers silent. In the Dauphin map (1530-36) Australia's place is occupied by 'Jave le Grande.' A good deal of confusion has been caused by the medieval geographers' habit of inventing a southern continent for purposes of symmetry, the constant references to this entirely theoretical region being taken by laymen as mentions of the genuine Australia. The first European about whose sight of the continent we can be certain was the Spaniard Torres, who, coming across the Pacific, in 1606 sighted the coast south of Cape York, and afterwards sailed through Torres Straits; he, however, had no idea that he saw any more than a group of small islands like those he had previously been traversing. About the same time the Dutch vessel *Duyfken* was sailing down the west coast of the Cape York Peninsula, having avoided the western opening of Torres Straits because navigation in such a labyrinth of sandbanks, with adverse currents and strong south-east trade winds, was too dangerous for the clumsy vessels then employed. In 1623 the *Pera* had a similar experience; but Dutch belief in the existence of the Straits was not destroyed until Tasman's voyage of 1644, when for unknown reasons that explorer announced definitely that the southern land was part of the New Guinea mainland. On the western coast discoveries began when, in 1611, the official course for Dutch ships outward-bound to Java was altered from the track past Madagascar to a long easterly run from the Cape, followed by a sharp bend northwards. In 1616 the *Eendracht*, sailing on this course, sighted Australia in lat. 26°, and its captain, Dirk Hartog, left an inscribed metal plate on the island still called after him. From that time such discoveries became frequent, and the visitors left Dutch names all round the western shores from Nuyts Archipelago on the east of the Bight to Arnhem Land on the Gulf of Carpentaria—which also was named after a Dutch governor-general of the Indies. Pelsart (1629), Tasman (1642-44), and the Englishman Dampier are the most notable of the discoverers during this epoch, and the first and third gave Europe fairly detailed, and none too favourable, descriptions of the western coastlands. The second epoch of discovery begins with Captain Cook (q.v.), who in 1770 sighted the south-eastern coast below Cape Howe and coasted northwards along the shore to Cape York, annexing the region he had found to Great Britain. Little more was done, except in southern Tasmania, till the first settlement was made at Sydney in 1788 under Governor Phillip; but thereafter discoveries and detailed surveys along the coast became frequent,

the chief names being those of Bass, who first sailed through Bass Straits; Flinders, who with Bass circumnavigated Tasmania, and afterwards made a thorough survey of the coast of the continent from Cape Leeuwin by the east to Arnhem Land (except such portions between Encounter Bay and Sydney as had been worked over by minor men); and P. P. King, who completed Flinders's work by surveys along the northern and western shores.

The settlement at Sydney was designed for convicts, who must be kept for discipline's sake strictly within bounds. The early governors, therefore, did not much encourage exploration inland; but Macquarie (1810-21) altered this policy entirely, backed the expedition under Blaxland which first crossed the Blue Mountains (q.v.), and aided the pastoralists who, following in the tracks of Blaxland's successor Evans, poured across into the western plains and along the valleys of the Macquarie and Lachlan. Oxley in 1817 traced both these rivers to apparently impassable marshes, and in 1823 discovered the Brisbane River; Hume in 1824 crossed from Sydney to Port Phillip; Cunningham (1823-28) worked north behind the main range and discovered splendid pastoral country at the back of Moreton Bay. Sturt, the greatest and most unfortunate of Australian explorers, discovered the Darling in 1828, the lower Murray and its affluents in 1829 (voyaging along it to its mouth and back under great hardships), and in 1844-45 traversed the always and country west of the Darling to Cooper's Creek in a season of exceptional heat, returning with shattered health and eyesight permanently injured. Meanwhile Mitchell (1831-36) connected all previous discoveries in New South Wales, crossed western Victoria to the sea, and returned by Hume's old tracks; as in 1835 two Tasmanian settlers, Batman and Fawkner, had explored and begun to settle the shores of Port Phillip, south-eastern Australia from Brisbane to Adelaide was by 1837 fairly well known and in process of settlement. Settlement was at this time and for fifteen years afterwards almost purely pastoral, since John Macarthur, a settler of the very early days, had found out that the climate was admirably suited for the growing of the finest grades of merino wool; as this product was valuable enough to bear the huge cost of carriage over long distances to a port, it became the exclusive staple of eastern Australia, and the whole commercial system of the colonies was devised to suit it. Coal was mined on the coast of New South Wales, and copper during the forties in South Australia; otherwise the occupied land was given over wholly to cattle and sheep, particularly sheep.

The gold-discoveries of 1851 altered all that, both enormously increasing the town populations and planting among the scattered pastoral settlements bodies of men who needed food-supplies in their immediate neighbourhood. From that began agriculture, hitherto badly neglected; but the farms had to be taken from the squatters' best grazing-land, and the war between squatter and 'selector' soon became a dominating feature both in the settlement and in the politics of the colonies, besides gravely affecting their finance—since squatters endeavoured to protect their grazing-land by purchasing it with borrowed money, and in times of drought (for which they made very little provision) found themselves in the hands of the banks, which in their turn were overloaded with unrealisable securities. Not till the settlers understood that the evil of dry seasons could be minimised, like any other recurring misfortune, by forethought and improved methods of farming, and the legislatures had been convinced that agriculture, not sheep-farming, must be encouraged on all soils fit for it, did Australian settlement become much

more than an exciting gamble; till then the country as a whole, taking results over a number of years, prospered and the bounds of settlement extended, but at the cost of huge individual losses.

In the third exploration period, during which the work of opening up the centre and west of the continent was based on a fairly populous coastal community, the chief names are those of Stuart, Gregory, and Forrest. An intermediate period, in the forties, had been made notable by the work of Eyre along the Bight, Leichhardt along the main range in Queensland and thence past the end of the Gulf of Carpentaria to Port Essington in the Northern Territory, and Mitchell in central Queensland; Sturt's great journey at this time has already been mentioned. The gold-rush checked exploration, but towards the end of the fifties A. C. Gregory, already expert in Western Australian travel, extended the borders of the region opened up by Leichhardt, and McDouall Stuart found good grazing-country west of Lake Eyre. One of the greatest and most successful of all Australian explorations was Stuart's passage across the continent from south to north, achieved (against immense difficulties after two failures) in 1862, on a route which still remains the best known and has been made permanent by constructing along it the overland telegraph-line to Port Darwin. Stuart, however, was not technically the first man to cross the continent; that had been done in the previous year by the tragic expedition of Burke and Wills, who made their way from the Darling by Cooper's Creek to the estuary of the Flinders on the Gulf of Carpentaria. On their return journey, however, partly because of misunderstanding orders and bad luck, partly because the leader was totally inexperienced in bushcraft, they perished miserably of starvation near Cooper's Creek. But the expeditions sent out to find them did really good work, so that by the end of 1862 Australia east of the telegraph-line was well mapped out. Later explorers therefore set themselves to open up Western Australia; F. T. Gregory penetrated the north-west, and Alexander Forrest joined up his discoveries with the Victoria River in the Northern Territory; Warburton and Giles made hurried journeys across the central region from South Australia to the west coast; but John Forrest, travelling more steadily and observing his surroundings as he went, opened up new and valuable districts both in the south behind the Bight country and in the centre between lat. 25° and 28°. In these regions settlement is almost entirely pastoral, except where the astonishing mineral wealth of the tableland has been tapped on gold-fields which stretch across the western state from the Murchison south-east to Dundas.

The political settlement of the continent, since no foreign power has ever interfered in it, need not here be recounted at length. The first colony, New South Wales, though for many years it occupied actually a mere fraction of the south-east corner, stretched nominally across Australia to long. 135° E., Tasmania—which was at first thought to be part of the mainland—being included. In 1825 Tasmania became a separate colony under a lieutenant-governor. In 1827 the western boundary of New South Wales was removed to long. 129°, and the region west of that line was two years later constituted the colony of Western Australia. In 1836 a large section of southern New South Wales was segregated to form the province of South Australia; in 1846 an unsuccessful attempt was made by Mr Gladstone, then Colonial Secretary, to form a colony of Northern Australia in the territory north of lat. 26°; a lieutenant-governor was actually sworn in and a legislature formed, but Earl Grey, on taking office as Mr Gladstone's successor, hastened to annul these actions. In 1861 the lands south of the Murray

were separated from New South Wales to form the new colony of Victoria, and in 1859 the area (roughly speaking) north of lat. 29° and east of long. 141° was constituted the colony of Queensland. This left the mother-colony in two widely separated sections—the one which still retains the original name of New South Wales, and one embracing as much of the territory between longs. 129° and 141° as was not South Australia. Of this section a strip on the north-east was added to Queensland, a strip on the south-west to South Australia, and the remainder, under the name of the Northern Territory, was retained in the possession of Great Britain, but handed over temporarily to be administered by South Australia.

By 1863, therefore, the continent had been divided among five distinct colonies (Tasmania being the sixth), each with a seaport capital, and each consequently somewhat jealous of the rest and determined to preserve its own territory's trade for its own capital. Other motives of severance were provided (a) by the almost arrogant pride of the two colonies—South Australia and Victoria—to which convicts had never been sent, and the fact that Western Australia continued to receive convicts up to 1868, while Tasmania had seen the last of them in 1852 and New South Wales in 1840; (b) by the development in Victoria of a protective fiscal policy towards which South Australia gradually tended, while New South Wales remained sturdily free-trade and influenced Queensland in the same direction. Efforts made by the British government in the fifties to introduce some form of federation failed entirely. But during the eighties problems of external policy, which affected most of the colonies equally, began to need instant attention; the immigration of Chinese, troubles with France over the convict population of New Caledonia and with Germany over the division of eastern New Guinea (which Queensland had annexed *en bloc*, only to find her action disavowed by the home government), and a growing sense of Australia's defencelessness, all enforced the necessity for a united action which was quite impossible to six mutually distrustful colonies. Even so it took nearly twenty years to reconcile the legislatures to surrendering a part of their powers to some central body; indeed, federation was only achieved by the bold action of a premier who appealed to the electors at large over the head of parliament. In 1901 the Commonwealth of Australia came into being as the sole authority through which Australians could deal politically with the outside world, the six Colonies being thenceforth known as States.

Government and Defence.—The history of Australian government falls into four stages. From 1788 to 1823 the governor was locally absolute, responsible to no one except the home authorities. From 1823 to 1842 he was assisted by a nominated legislature with advisory powers. From 1842 to 1856 two-thirds of the legislature was elected by freeholders and a few others; it could initiate legislation, and had a large measure of control over colonial finance. From 1856 onwards responsible government existed in its fullest sense. The dates just given refer to New South Wales, of which all the other Colonies except Western Australia were at one time a part. Tasmania entered the second stage in 1825, the third in 1850; Victoria was separated during the third stage, Queensland during the fourth; South Australia, beginning with a dual absolutism of Governor and Land Commissioners, entered the second stage in 1843 and the third in 1851. All these Colonies gained responsible government together. Western Australia had only two years of absolutism, but its second stage lasted from 1831 to 1870 (since transportation did not

cease till 1868), and its third till 1890. Since the establishment of responsible government the only change has been that which redistributed governmental powers between the States and the Commonwealth.

The government of the Commonwealth is vested in a governor-general appointed by the crown, and two houses of parliament—the Senate, consisting of six representatives from each state, elected for six years (three every third year) by the whole body of state electors; and the House of Representatives, seventy-five members elected by districts as nearly equal in numbers as possible (but ranging from 30,000 to 45,000), except in Tasmania, to which five members are allotted irrespective of its insufficient population, and in which the constituencies range from 18,000 to 23,000. The Federal Parliament has sole control of external affairs (including the restriction of immigration), customs and excise, defence, posts and telegraphs, overseas and inter-state commerce, and may when it likes make laws regulating marriage, banking, and many other matters of common interest. An important part of the governmental machine is the Federal High Court, consisting at present of seven judges, which besides the ordinary judicial functions with respect to matters of federal concern is also empowered to decide whether by any particular law or act the Federal government has transgressed the limits of the constitution, and has hitherto interpreted those limits very strictly. (For the Federal Arbitration Court, a branch of the High Court, see *ARBITRATION*.) The Federal government has full control of the territories (Northern and Federal) which are actually part of the Commonwealth, and of the dependency of Papua (formerly known as British New Guinea), which is outside it; it also administers certain 'mandated' areas, formerly German colonies, lying between Dutch New Guinea and the British Solomons. Among its most important acts has been the construction between 1909 and 1912 of a complete system of Australian defence, based on the principles of compulsory military training and local fleet-maintenance, and developed in accordance with recommendations made by Lord Kitchener and Admiral Sir R. Henderson. The local squadron, designed as a 'unit' of an imperial Pacific fleet on a plan drawn up at the Naval Conference of 1909, included a battleship (*H.M.A.S. Australia*, 19,200 tons), three light cruisers (5600 tons), six ocean-going destroyers, and two submarines, all built out of revenue; with the necessary naval bases and other works, the cost amounted to about a million annually for construction and a million and a half for maintenance. The army, based on a system which trains boys of 14 to 18 as cadets and youths of 18 to 25 as territorial militia, was planned to comprise—when the system was in full working order—nearly 90,000 trained soldiers (Light Horse, 10,000; Infantry, 63,000; Artillery, 7000; Engineers, 3000), with 16,000 recruits annually in training. Military expenditure just before the Great War amounted to about 3½ millions annually. Australia's total defence expenditure was at that time 5½ millions a year, or about 23s. 6d. per head of population. The war temporarily upset all these arrangements. The squadron, after engaging in minor operations in the Pacific (always under the direct orders of the Admiralty), was split up among various imperial squadrons, and (though the destroyers were handled as a single flotilla) became a collection of individual ships operating in all the oceans. The army was superseded for fighting purposes by a volunteer force—the Australian Imperial Force, known as the A.I.F.—that served at first in Egypt and on the Gallipoli peninsula, its light horse subsequently fighting in Palestine, while

the infantry and artillery went to France. Gradually a connection was established between the regiments of the A.I.F. and those of the citizen army; and after demobilisation of the A.I.F. its officers were as far as possible absorbed into the citizen forces and given the training of the annual contingents of recruits.

The State governments consist of governors appointed by the crown, and legislatures of two houses. The Upper House or Council in New South Wales is nominated, as was that of Queensland, abolished in 1922; in the other states it is elected for six years by a limited electorate. All the Lower Houses or Assemblies are elected by adult suffrage; in four States (New South Wales, Victoria, Queensland, and Western Australia) there are single-member constituencies; in South Australia forty members are elected by twelve constituencies, and in Tasmania thirty by five under a system of preferential voting. Victoria and Queensland also have preferential systems, and New South Wales the second ballot—which works so badly that a preferential system is certain in the near future. The States retain all powers not expressly surrendered to the Commonwealth by the constitution; the chief of these concern land, education, railways, and local government in general; they may levy direct taxation in any form; and their boundaries cannot be altered without their own consent. For further particulars concerning government, see under the State concerned.

Population, Religions, Education, &c.—The population of the Commonwealth at the census of 1921 was 5,426,008, exclusive of full-blooded aborigines; this is an increase since federation of rather more than 1½ millions in twenty years, or little more than 2 per cent. per annum. The proportion of males to females is about 51 to 49; males are in excess at every age, but among persons under twenty-one the excess is very small. The following results are taken from the census of 1911: eighty-two per cent. of the population was born in Australia, over 13 per cent. in the United Kingdom, and about 1½ per cent. in some other European country; the people are thus overwhelmingly British. Queensland and Western Australia are the only States in which the non-British population exceeds 5 per cent. (the Northern Territory, with its three thousand inhabitants, is not included in this discussion). The increase of population between 1901 and 1911 was due mainly to a high rate of natural increase (births minus deaths), less than 14 per cent. of it arising from immigration; between 1901 and 1905, indeed, there was a loss of nearly 17,000 souls due to emigration. Unfortunately the greatest increase was in the vicinity of the six State capitals, which in 1911 contained 38 per cent. of the total population. Classified by occupations, 13 per cent. were engaged in primary production, 12½ in town industries, 6½ in commerce, 4½ in domestic service (including hotels, boarding-houses, &c.), 3½ in transport, and 3 in professional work; 55 per cent. were 'dependent on natural guardians'; about ½ per cent. returned themselves as of independent means; the rest were unspecified.

Australia has no state church, but a large number of people of indefinite belief usually return themselves as belonging to the Anglican church; the census results therefore show that denomination as predominant with 38 per cent. of the population, the Roman Catholic church claiming 21 per cent., and the Presbyterian and Methodist churches a little over 12 per cent. each. Remarkable features of the religious census (which was practically complete, only 2½ per cent. of the population refusing to state their religion) were the great

increase in Presbyterianism—31 per cent. in the ten years, against Anglicanism's fourteen and the eight of the Roman Catholics—the large number who returned themselves as 'Protestant' or 'Catholic' without further definition, and the great falling-off among 'Freethinkers,' 'Agnostics,' and the like, who were actually 16,000 fewer than in 1901.

Methods of education are dealt with under the separate States and in EDUCATION. The simpler results, as disclosed by the census, are that about 1½ per cent. of those between ten and twenty years of age, and about 6 per cent. of those over the latter age, may be unable to read and write English; as quite half the individuals included in this calculation made no return at all, and a good many more (about 1 per cent. of the total) could read and write in a foreign language, the actual illiteracy is much smaller. Of the children of 'primary' age (seven to twelve) 75 per cent. go to state schools and 16 per cent. to private schools; but of those fifteen years old less than 20 per cent. go to schools of any sort, and at eighteen the percentage sinks to 3, not including about three in every 1000 who attend the universities.

Literature.—Australian literature has been unduly praised and unduly belittled, the one treatment probably a consequence of the other. A brief review of its history is therefore worth making. Apart from the work done in or about Australia by English writers of the early days, and from the outburst of excellent journalism excited by bitter political controversies in the forties of last century (to which Henry Paikes and Robert Lowe—afterwards Lord Sherbrooke—were the chief contributors), the first indigenous literature sprang from a little circle of writers encouraged by J. L. Michael, a friend of Ruskin and Millais and a strong supporter of the Pre-Raphaelite Brotherhood. His most notable protégé was Henry Kendall, a lyrical of high order, whose best verse still sets the standard for pure beauty among Australian writers. Adam Lindsay Gordon (q.v.), who is often coupled with Kendall, was merely an English schoolboy with a talent for brisk rhyming and a love of horses and the open air that appealed to his Australian audience; and his editor, Marcus Clarke, was a brilliant but shallow journalist with no knowledge of the bush—though Clarke's one great novel, *For the Term of his Natural Life*, is a masterpiece of documented fiction. D. H. Deniehy and William B. Dalley carried on the tradition of good journalism in New South Wales, and Brunton Stephens in Queensland produced studious but rarely inspired verse during the seventies; and in the eighties a number of native-born students began to write thoughtfully, imitating the current English phraseology. But in the eighties a new spirit was already moving among new men. The spread of state-school education gave the worker articulate utterance just when a new journal, fanatically insistent on Australian 'nationality,' threw its columns open to all local work with a spark of talent in it; and towards the end of the nineties a series of volumes, both in prose and in verse, collected from the *Bulletin's* pages, made known to Australians at large and, in some degree, to overseas critics the rise of a genuine locally-stimulated literary movement. Of this movement the real leaders were John Farrell, whose work excited the admiration of Lord Tennyson, and Henry Lawson, whose best prose is gaining a European reputation, though his verse is weaker and very uneven. Victor Daley, a truer poet than any except Kendall, is hardly known outside Australia because his work is almost devoid of definite local colour, though it could scarcely have been written anywhere but

in the glowing Australian sunshine. Other good work, similarly neglected outside Australia for a similar reason, may be found in the scanty production of Christopher Brennan and the austere symbolism of Bernard O'Dowd; and Australian literature cannot be appraised without a knowledge of the writings of these five. In prose fiction, apart from Lawson's short stories and Clarke's one masterpiece, Australia has nothing of permanent value to show, but much of more than passing interest. In other branches fine work has been done—notably MacCallum's Shakespearian studies, and the legal and constitutional essays of Harrison Moore and Jethro Brown; while the mass of historical material recently made available has set students to the reconstruction of Australian history—work of which Henderson's *Sir George Grey* and Scott's *Terre Napoléon* and *Matthew Flinders* are good examples. In drama nothing of importance has yet been done.

In music Madame Melba's name is famous, and those of Percy Grainger and George Boyle likely to be so. In art the work of Bertiam Mackennal and Charles Conder is usually cited, but their training was entirely European; that of George Lambert and Arthur Streeton can be more justly claimed as Australian in origin, so far as art has any nationality at all. In science the achievements of Baldwin Spencer (in ethnology), C. J. Martin (physiology), James P. Hill (embryology), T. W. David and H. J. Jensen (both in geology), are based on Australian research during long residence there, though most of them were English-born.

Australian journalism, though markedly clean and sober in its tendencies, has rarely been of a high order; the few exceptions have been already mentioned. The daily papers are cramped by the political leanings of their advertisers, and the weekly and monthly magazines swamped by the influx of British and American competitors. A few endeavours—notably the *Australian Magazine* of 1899—to establish magazines of high standard died young for lack of advertisements. Of actual journals there is no lack; the six State capitals between them support more than a score of daily newspapers, and the total number published in the Commonwealth is about 1200.

Commerce and Industry.—Industries are under State control, except in cases where an industrial dispute extends beyond a single State; inter-state and overseas commerce are entirely under Federal control, and the latter is subject to a uniform customs tariff established by the Federal Parliament in 1908, with slight amendments made in 1910 and 1911. The tariff was in 1914 revised by the Inter-State Commission, and its recommendations were accepted practically without debate during the war; the revision made in 1921 by the parliament shows clearly that Australia has accepted definitely a fiscal policy of protection to native industries, coupled with (a) effective preference to British goods over foreign, (b) allotment to the employees of a substantial share of the benefits obtained from protection, (c) the co-existence of light duties on certain articles of common consumption and heavy duties on certain luxuries, for the purpose of obtaining revenue. All political parties have accepted this policy, with a view of making the Commonwealth as far as possible self-contained in war-time (as well as for other reasons); and it is probable that for the future tariff alterations will be entrusted to a non-political business board.

Communications.—The railways of Australia, having been constructed almost entirely by the several States with a view of bringing traffic to the state capitals, are a distinctly heterogeneous collection of imperfect systems, descriptions of which

will be found under the States concerned; but lines now under consideration or construction will to some extent create from them a larger system worth noting here. It will comprise (a) a coastal line from Cairns in northern Queensland to Sydney, with an extension across the tableland to Melbourne and Adelaide—this line will be relieved by a parallel line on the tableland between Brisbane and Sydney, a direct line from Sydney *via* Bathurst and Broken Hill to Adelaide, and inland connections between the last two lines; (b) lines from Adelaide, diverging near the head of Spencer's Gulf, across the continent west and north to join up Western Australia and the Northern Territory; (c) possibly a third transcontinental line north-west from Sydney across Queensland into the Northern Territory, dividing there so that one branch joins the northern transcontinental, the other reaches a new port on the Gulf just below the estuary of the Roper River. Of these the western and northern transcontinentals, and all lines within the Northern Territory, are to be constructed by the Federal government on a gauge of 4 feet 8½ inches; the rest in existence or under construction are State-controlled and of the State gauge, whether it be 4 feet 8½ inches as in New South Wales, 5 feet 3 inches as in Victoria and the south-eastern corner of South Australia, or 3 feet 6 inches as in the other states. This variety of gauges, coupled with the many other divergences of railway and commercial policy between the states, makes the creation of the complete system just outlined a matter of difficulty and delay; but all important railway work now being undertaken or projected is an approximation towards it, and it has been decided that all main lines shall gradually be converted to the Federal gauge.

Sea-communication between the States is carried on by steamships of a gross tonnage of 250,000 and an indicated horse-power of 211,000. The overseas mail-boats do not carry coastal freight. The Federal Post-office controls nearly 6000 offices, two-thirds of which are also telegraph-offices, and deals with nearly 600 million letters and 338 million other postal articles annually, also transmitting about 15 million telegrams, and about 500,000 cablegrams to places beyond the Commonwealth. Since 1910 it has subsidised the Orient Mail line for overseas service, and pays about £50,000 a year to inter-state shipping-companies for carrying coastal mails, and about £20,000 for services among the islands of the western Pacific. Other companies, subsidised by their own governments or unsubsidised, take regular mails for Europe, Canada, and the United States; to South Africa there are frequent but irregular services. The normal length of transit of mails from London to Adelaide is a little over twenty-eight days; Sydney gets them two days later. Telegraphic communication with countries beyond the Commonwealth is carried on by three western cables under private control—from Port Darwin to Banjoewangie, from Broome to Banjoewangie, and from Fremantle *via* Cocos Island to Durban—and three eastern cables, one to New Zealand, one to New Caledonia, and one—the Pacific cable—to Canada, with a double route as far as Norfolk Island (from Southport in Queensland direct, and from Sydney *via* New Zealand). The route-lengths to London are *via* Broome from Perth 12,296 miles, *via* Port Darwin from Adelaide 13,125 miles, and *via* Canada from Sydney 15,158 miles. The Pacific cable is the property of the British, Australian, Canadian, and New Zealand governments jointly, Australia having slightly the largest share. A system of wireless telegraphy has also been established round the Australian coasts, and in Papua and the mandated territories. The principal

stations (day-range 1250 miles) are at Sydney, Perth, and Townsville. Sydney and Perth have frequently intercepted messages from Nauen and Paris, and occasionally from London.

Statistics.—The following table illustrates the progress of the Australian Commonwealth since its birth in 1901:

	1901.	1920.
Population	3,773,801	5,426,008 (1921) 15·12
Rate of natural increase per 1000..	14·21	
Federal revenue	£11,206,985	£52,782,750
State revenues, total (including businesses).....	23,197,927	70,071,743
total revenue raised in Australia	32,130,673	116,137,126
Federal expenditure from revenue	3,932,746	49,517,097
State expenditure from revenue (including businesses)....	29,231,885	72,046,447
Total expenditure from revenue in Australia ..	33,164,181	114,843,052
Public debt—		
Borrowed in London.....	174,810,877	426,231,841

Figures in the right-hand column, except when otherwise dated, are for the statistical year from July 1919 to June 1920.

See the articles NEW SOUTH WALES, QUEENSLAND, SOUTH AUSTRALIA, TASMANIA, VICTORIA, WESTERN AUSTRALIA. For all statistical and general information, with regard to States as well as Commonwealth, the series of *Official Year Books of the Commonwealth* is indispensable; the latest annual issue is of course most up to date, but valuable articles on special subjects occur in the earlier volumes only, being merely indexed in the later. The unofficial *Year-Book of Australia* is also trustworthy on the limited range of subjects with which it deals. Rusden's *History of Australia* is the only history on a large scale; the *Historical Records of New South Wales*, and the *History of New South Wales from the Records* founded on them, are practically exhaustive on the very early days; the *Historical Records of Australia* are at present concerned almost entirely with the despatches of the early governors; Wyatt Tilby's *Australasia* (1912) and Rogers's *Australasia* (1907, in Sir C. P. Lucas's "Historical Geography" series) are interesting but sketchy; the present author's *Australasia* (1901, in Temple Primers) and *History of Australasia* (7th ed. 1921) present in condensed form much otherwise unpublished matter. For physical geography and geology, Gregory's *Australasia* (1907) and Griffith Taylor's *Physnography of Australia* (1913) are the best available; Lucas and Le Souef's *Animals of Australia* (1909), Maiden's *Useful Native Plants of Australia* (1889), and Waterhouse and Lyell's *Australian Butterflies* (1914) are sound works, but the flora and fauna have been usually written up by experts in the various States (see separate articles). Collingridge's *Discovery of Australia* and Favenc's *History of Australian Exploration to 1888* are still the best compendia on these subjects; see also Hooker's *Journal of Sir J. Banks*, Scott's *Life of Matthew Flinders* (1914), and the published journals of Sturt and Mitchell. On the aborigines, Spencer and Gillen's *Native Tribes of Central Australia* (1899), Spencer's *Native Tribes of Northern Australia* (1914), Roth's *Ethnological Studies* (1897), Howitt's *Native Tribes of South-Eastern Australia* (1904), and John Mathew's *Eaglehawk and Crow* (1899) are sound authorities. Social questions are well handled in Clark's *Labour Movement in Australasia* (1907), and Schachner's *Aus-*

tralien (1909, 1911, not yet translated into English); the discussion in Wise's *Commonwealth of Australia* (1909) is also useful. On agriculture there is nothing better than the admirable Report of the Scottish Commission, republished as *Australia, its Land, Conditions, and Prospects* (1911). Other useful works are Harrison Moore's *Constitution of the Commonwealth* (2d ed. 1910), Reeves's *State Experiments in Australia and New Zealand* (1902), Bean's *Flagships Three* (1913), and the *Australasian Naval and Military Annual* for defence matters, and *Fred John's Annual* for biographies of prominent men. So much study has been devoted to Australian subjects since the coming of the Commonwealth, and so much new material has been forthcoming, that all earlier compilations dealing with those subjects must be read with caution, and many of them with profound distrust.

Austral Islands, or TUBUAI, a scattered group of South Pacific Islands, south of Tahiti and south-east of the Cook Islands. The chief islands are Rurutua, Vavatau, and Rimitara. Rapa, or Oparu, has great stone platforms and walls like the Easter Island 'terraces'. The group forms part of the French establishments in Oceania. Area, 115 sq. m.; pop. 2500.

Austrasia ('East Kingdom'), the eastern possessions of the Franks, embracing Lorraine, Belgium, and the right bank of the Rhine, with their central point at Metz. Under Charlemagne's successor, Austrasia merged into Germany; and Neustria, or West Frank-land, into France. See FRANCE, FRANKS, NEUSTRIA.

Austria, since 1918 a republic of Central Europe, was till that date (with much wider bounds) an empire constituting one moiety of the Austro-Hungarian Monarchy (see AUSTRIA-HUNGARY). The areas and populations of the seventeen lands of the Austrian Empire at the census of 1910 will be found in the article AUSTRIA-HUNGARY.

In 1920, after the formation of the Czechoslovak republic, and cessions to Rumania, Poland, Italy, and Serbia (Yugoslavia), there remained to Austria:

	Area in Sq. Miles	Population in 1920.
Vienna (federal capital)	212	1,841,326
Lower Austria	7,441	1,457,535
Upper Austria	4,625	858,795
Salzburg	2,701	214,200
Styria	6,301	853,684
Carinthia	3,177	366,589
Tyrol	4,048	306,304
Vorarlberg	1,004	138,212
	29,929	6,131,445

To these must be added part of German-speaking West Hungary (Burgenland) allotted to Austria by the treaty of St Germain, but curtailed in 1922. The chief towns are Vienna, Gratz (pop. 1920, 157,032), Linz (93,473), Innsbruck (55,659), Salzburg (36,450), Wiener Neustadt (35,023), Klagenfurt (26,111), Sankt-Pölten (23,061), Villach (21,896), Baden-bei-Wien (21,095), Steyr (20,234).

Austria is almost entirely mountainous. The Rhaetian and Noric Alps stretch from Switzerland to the Danube, rising in several places above 12,000 feet (Wild Spitz, 12,369; Gross Venediger, 12,008; Gross Glockner, 12,461—the Ortler Spitze, 12,802, fell to Italy in 1919). Their height gradually declines towards the Hungarian plain and the Danube valley in the north-east, where the Leitha Gebirge (3000 feet), overlooking the plain of Vienna, form the transition to the Carpathians (now outside of Austrian territory). The Noric Alps include the Hohe Tauern and Niedere Tauern in the north, and the Karawanken on the southern border. The greatest lakes are the Lake of Constance and the Neusiedler See, at the two extremities of the country. The Alps enclose numerous mountain-lakes of great beauty. The scenery of the Salzkammergut and neighbouring regions is famous. The Danube crosses the north-eastern end of Austria, and, except Vorarlberg, which drains to the Lake

of Constance and the Rhine (its western boundary), the whole country is within the Danube basin. The chief Austrian tributaries of the Danube are the Lech, the Inn, the Taurn, the Enns, the March (on the Czechoslovak frontier), the Raab, and the Drave or Dran, with its tributary the Mur. The Danube and March are international waterways. The Inn is also navigable, and in a small way the Drave. Austria lost her sea-coast in 1919, but freedom of transit to Adriatic ports was accorded.

Mining has been an important pursuit in Austria for centuries; and though the chief mineral regions were lost by the Great War, Styria, Carinthia, and Salzburg remain. The most important minerals are iron and coal (lignite and some anthracite). Iron is got in Styria, Carinthia, and Salzburg; coal in Lower Austria; lignite in Styria and Upper Austria. Salzburg is the chief copper-producing land. Carinthia has lead and zinc. Salt is prepared at great saltworks at Ebensee, Aussee, Hallstadt, Ischl, and Hallein in and around the Salzkammergut, and at Hall in Tyrol. Some of these names indicate the antiquity of the industry. Some gold is got in Salzburg. Styria has graphite. The other minerals include silver, marble, and building-stone. There are mineral springs at Gastein, Baden-bei-Wien, and elsewhere, but most of the famous resorts of the empire are now in Czechoslovakia.

Vines and maize are grown wherever conditions are favourable; and wine is made. The principal crops, however, are potatoes (in the higher regions the staple food), rye, oats, and wheat. Horticulture is carried to great perfection; and the orchards of Upper Austria, Styria, and Tyrol produce a profusion of fruit. Cider is made in Upper Austria and Carinthia. Flax, hemp, beet, and tobacco are widely grown. The forests, which are very extensive, yield, besides timber, many secondary products, as tar, potash, charcoal.

Beas, wolves, and lynxes are found; wild goats in the highest, chamois and white Alpine hare in the middle, belts of the mountains. There are productive fisheries in the Danube and other streams and lakes. Considerable attention has been given to horse and cattle rearing, and dairy-farming is of some importance.

Manufactures include iron and steel goods, alloys, machinery, vehicles, musical and scientific instruments, textiles (cotton, woollen, flax, hemp), paper, pottery, wooden wares.

In respect of commerce Austria is most unfavourably situated. High mountains oppose great obstacles to communication, and separate the producing districts from the nearest sea; while the great navigable river has its lower course in other countries. Since 1809 a great number of highways have been made. The Semmering (q.v.) road is a remarkable construction, but in height it is far exceeded by the Stülfserjoch or Stelvio Pass (Italian since 1919), across which the Austrian government in 1820-25 made the highest of all the Alpine carriage roads. More remarkable still are the railways over the Semmering (1850-53) and Brenner (1867). The Arlberg tunnel in 1884 brought the remote Vorarlberg into closer relations with the rest of Austria; and the Tauern tunnel, about 4000 feet above sea-level and over 5½ miles long, opened in 1909, gave direct communication between Salzburg and Carinthia. By help of these and other lines connecting the east-and-west valley routes, the Austrian government has since 1841 covered the country with a tolerably complete network of railways, amounting to about 4000 miles. River communication received a great impulse from the introduction of steam. The Danube Steam Navigation Company was formed in 1850. For the commissions for the management of navigation, see

DANUBE. The canal system is not extensive. Canals to connect the Danube with the Rhine, Elbe, Oder, and Vistula have been projected, but political changes have made their prospects very uncertain. The Vienna and Neustadt Canal in Lower Austria has a length of 40 miles.

A great many political impediments to commerce were removed or diminished during the 19th century. The customs boundary between Austria and Hungary was done away in 1851, and in 1852 Austria passed from a prohibitive to a protective system. The customs union broke up with the Dual Monarchy, leaving the economic relations of the succession states in confusion.

Before the dismemberment of the empire Austria's population was more than half Slav. In 1910, out of 28½ millions, there were 6½ million Czechs and Slovaks, 5 million Poles, 3½ million Ruthenians, 1½ million Slovenes, ¾ million Serbo-Croats, or 17 million Slavs in all. Germans were the most numerous single nationality, with 10 millions. Of a million Latins, three-fourths were Italians, Ladins, and Friulians; the remaining fourth, Rumanians. Since 1919 Austria has been almost purely German; and much even of German-speaking Austria went to Czechoslovakia, Italy, and Yugoslavia. Race and language, however, do not coincide. The Austrian population is darker and more round-headed than the north German. Probably it is in the main a mixture of the Alpine and Northern races of man. The German spoken by the Austrians is of the 'Oberdeutsch' dialects of the adjoining parts of Germany—Bavarian-Austrian for the most part, Alemannic-Swabian west of the Lech and the upper Inn. For literature and educated conversation, of course, ordinary standard German is used, though there is also a dialect literature. The literature of Austria has often a point of view or a flavour of its own, as, for example, in the drama of the 20th century. See GERMANY (*Language and Literature*). Some of the greatest German musicians have been Austrians, as Haydn, Mozart, Schubert; while others such as Gluck, Beethoven, Brahms, and Strauss settled in Vienna for longer or shorter periods. Among painters, Makart, Defregger, and Klint are well known. The great bulk of the people is Roman Catholic. There are two archbishops (Salzburg and Vienna) and five bishops.

Education is compulsory generally from the age of six to fourteen. There are some 5000 public and private elementary schools, with 1,000,000 pupils; 140 gymnasia and realschulen, with 40,000 pupils. Austria has three universities—Vienna, Gratz, and Innsbruck. There are polytechnics at Gratz and Vienna. Salzburg has a Catholic, Vienna a Protestant, faculty of theology. Vienna is famous for its art collections and learned academies, notably the Academy of Sciences. The chief libraries are the National (formerly Imperial) and the University Library at Vienna.

Constitution.—Before the revolutions, secessions, and partitions of 1918-19, when the Austrian Empire, under the sovereignty of the Hapsburg family, was one of the components of the Austro-Hungarian Monarchy (see AUSTRIA-HUNGARY), the Reichsrat consisted of an upper and a lower house. The former (Herrenhaus) was composed of princes of the imperial family, hereditary nobles, archbishops, bishops, and about 150 to 170 life members nominated by the emperor. Under the law of 1907, the last of a series modifying the constitution of 1861, the 516 members of the lower house (Abgeordnetenhaus) were elected for six years by equal, direct, and universal male suffrage. Electoral districts were as far as possible arranged to be of uniform nationality.

On the 12th of November 1918 the republic was

proclaimed. A National Constitutional Assembly met in 1919; all titles of nobility were abolished; and in October 1920 a new constitution was adopted. The republic is a confederation of autonomous lands, with Vienna (detached from Lower Austria) as federal capital. The National Council (Nationalrat) of 175 members is chosen for four years by universal secret direct vote, by the system of proportional representation. The provincial diets, single-chamber bodies elected in like manner, choose the members of the Federal Council (Bundesrat) in proportion to population. Its powers are advisory. The National and Federal Councils form the National Assembly, and jointly elect the president, who holds office for four years. The federal chancellor, vice-chancellor, and ministers are elected by the National Council. All Austrians (male or female) over the age of twenty have the suffrage, and all over thirty are eligible. All citizens have equal rights. Each commune has an elected council, which chooses a burgomaster from its own members.

Army and Navy.—For the Austro-Hungarian army and navy before the dissolution of the Monarchy, see AUSTRIA-HUNGARY. The treaty of Saint-Germain (1919) abolished compulsory service, and limited the army to 30,000 in all. Officers serve for twenty years, non-commissioned officers and men for at least twelve, including six with the colours. The seaboard being lost, Austria's navy is naturally restricted to a few small river craft.

History.—The empire of Austria arose from the smallest beginnings at the end of the 8th century. In 796 a Margraviate, called the Eastern Mark (i.e. 'March' or frontier-land; see MARCHES, MARQUIS), was founded as an outpost of the empire of Charlemagne, in the country between the Enns and the Raab. The name *Oesterreich* appears first in 996. In 1156 the mark was raised to a duchy; and after coming into the possession of the House of Hapsburg in 1282, it rapidly rose to a powerful state. The princes of that House extended their dominion by marriage, by purchase, and otherwise, over a number of other states, and from 1438 held almost without interruption the throne of the German empire. By the acquisition (1526) of the crowns of Bohemia and Hungary, Austria rose to the rank of a European monarchy. In 1804 Francis declared himself hereditary Emperor of Austria, and two years afterwards resigned the title of Emperor of Germany and King of the Romans.

In the earliest times, what was later the duchy of Austria was inhabited by the Taurisci, a Celtic people; but their name subsequently disappeared before that of the Norici. After the conquest of the Norici by the Romans (14 B.C.), the country to the north of the Danube belonged to the kingdom of the Marcomanni; on the south of the river lay the Roman provinces of Noricum and Pannonia, in which last was the municipal city of Vindobona (Vienna). Tyrol formed part of Rætia. All these boundaries were swept away by the irruption of the northern peoples; and the regions in question were occupied in succession, during the 5th and 6th centuries, by Boii, Vandals, Goths, Huns, Lombards, and Avars. After the Lombards had settled in Italy, the Enns, about 568, became the boundary between the Bavarians and the Avars. In 796 the armies of Charlemagne destroyed the Avars, and as a bulwark of his empire in that quarter, established the East Mark, which formed the nucleus of the Austrian empire, just as the mark of Brandenburg grew into the modern Prussia. The East Mark was at first of small and varying dimensions. Early in the 10th century it was almost effaced by the Hungarians, then newly arrived in their present seats; but Otto I. having

defeated them in the battle of Augsburg (953), reunited the country to Germany.

In 983 Otto appointed Leopold of Babenberg margrave of the reconquered province, whose dynasty ruled Austria for 260 years. Under Henry Jasomirgott (1141-77), the Mark above the Enns was annexed to the Lower Mark, the united province raised to a duchy, and important privileges conferred on the newly-named duke and his heirs. This Henry Jasomirgott took part in the second crusade; and he was one of the founders of Vienna. Under his successors, large additions (Styria, Carniola) were made to the possessions of the House. Leopold VI. undertook numerous expeditions against the Hungarians and the Mussulmans, and is reckoned the best of the Babenberg princes. The line became extinct with his successor, Frederick, who fell in battle with the Magyars (1246).

Then followed an interregnum from 1246 to 1282. The Emperor Frederick II. at first treated the duchy as a lapsed fief of the empire; but in the distracted condition of affairs, the Estates of Austria and Styria chose Ottokar of Bohemia as duke, who made good his nomination about 1260. Ottokar, refusing to acknowledge Rudolf of Hapsburg as emperor, was defeated, and lost his life and possessions, in the great battle of the Marchfeld (1278); and the emperor elect, as head of the Holy Roman Empire, shortly afterwards (1282) bestowed the vacant fiefs of Austria, Styria, and Carinthia on his sons Rudolf and Albert. These duchies were afterwards united in the possession of Albert.

From the year 1282 the House of Hapsburg ruled Austria, and was associated with all its greatness and vicissitudes from that time to 1918. Albert, the first duke of the line, had many difficulties to contend with, especially among his subjects, who insisted on their old privileges, but he energetically asserted his authority. He was murdered in 1308 by his own nephew. Of his five sons, Frederick was chosen (1314) by a party to the imperial throne, but was defeated (1322) by his rival, Louis of Bavaria. Duke Leopold was defeated at Morgarten (1315) in his attempt to reduce the Swiss cantons that had thrown off their allegiance to Albert I. In 1330 Albert II., another of the sons of the first Albert, succeeded to the duchy, and considerably increased the possessions of the House. After his death (1358), two of his sons, Rudolf and Albert III., successively followed in the duchy of Austria. Another son, Leopold, held the other lands, but lost his life at Sempach, in seeking to regain the Hapsburg possessions in Switzerland. The posterity of Albert III. and Leopold respectively formed the two lines of Austria and Styria. During Albert III.'s reign, Tyrol and other districts were ceded to Austria. After his death (1395) the dukedom was held by his son, Albert IV. Albert V., who succeeded his father in 1404, by marrying the daughter of the Emperor Sigismund, succeeded (1438) to the thrones of Hungary and Bohemia, and was at the same time raised to the dignity of German emperor, as Albert II. After his death in 1439, Bohemia and Hungary were lost to the House of Austria; but the imperial dignity was henceforth associated with it. With Ladislaw, Albert's son, the Austrian line of the House closed (1457), and their possessions went to the Styrian line. Of this line was the Emperor Frederick III., who raised the dignity of his House by making Austria an archduchy. Through the death of the other members of the House, Frederick succeeded in uniting the domains of Austria, curtailed, however, by the loss of the family possessions in Switzerland. He was succeeded in 1493 by his son Maximilian I.

The rise of Austria and of the House of Hapsburg to historical eminence may be said to date from the reign of Maximilian I. (1493-1519). By marrying Mary, daughter of Charles the Bold (1477), he acquired possession of the Netherlands. Through the marriage of their son Philip with Joanna of Spain, the Houses of Austria and Spain were united. As Philip died in 1506, his elder son, the celebrated Charles V., became heir to the united monarchies, and was elected emperor of Germany in 1519. Thus, by a succession of fortunate marriages, the House of Hapsburg became the most powerful dynasty in the world. This stage, at least, of Austrian history entirely justifies the well-known line:

Bella gerant alii; tu felix Austria, nube.*

Charles V., however, resigned all his German territories to his younger brother, Ferdinand I., who was thus the continuation of the Austrian branch of the line. Under Ferdinand the power of Austria greatly increased, for circumstances were now to put her into the dangerous but honourable and finally powerful position of bulwark of Christian Europe against the Turks. Ferdinand had married the sister of Louis, king of Bohemia and Hungary, and when Louis fell in the disastrous battle of Mohacz (1526), he claimed both these kingdoms. His claim to Hungary was contested by John Zapolya, who secured the aid of the great Turkish Sultan Soliman, the victor of Mohacz. Soliman accordingly invaded Hungary with a powerful army, and crushing all resistance, marched as far as Vienna, but failed in his siege of the capital (1529). Only a small part of Upper Hungary remained with Ferdinand, the rest of the country being subject to Turkey till near the close of the 17th century. Even the portion of Hungary that he held was a precarious possession, for which in 1547 he promised to pay an annual tribute of 30,000 ducats. On the abdication of Charles V. (1556), Ferdinand succeeded to the imperial dignity; he died in 1564, with the reputation of a good ruler, one strongly conservative of everything established, though he introduced the Jesuits. During his reign, however, the Reformation had made wonderful progress in the Austrian states.

In the partition of the inheritance that took place among Ferdinand's three sons, the eldest, Maximilian II., received the imperial crown along with Austria, Hungary, and Bohemia; the second, Ferdinand, Tyrol and Upper Austria; the third, Charles, got Styria, Carinthia, &c. Maximilian was more fortunate in Hungary than his father. The death of Soliman before Szigeth (1566) led to a truce; Maximilian had his eldest son, Rudolf, crowned king of Hungary in 1572, and shortly after, of Bohemia, and also chosen king of the Romans. But his attempt to bring the crown of Poland into his House failed. Maximilian II. was fond of peace, tolerant in religion, and a just ruler. He died in 1576; and of his five sons, the eldest, Rudolf II., became emperor. Under him, the possessions of the Archduke Ferdinand of Tyrol, who had married Philippine Welser, the beautiful daughter of an Augsburg burgher, reverted to the other two lines, Ferdinand's children not being considered noble. Rudolf II. was negligent, leaving everything to his ministers and the Jesuits. His war with the Porte and Transylvania brought him little credit; and the Protestants of Bohemia, oppressed by the Jesuits, extorted from him a charter of religious liberty. In 1608, he was obliged to cede Hungary, and, in 1611, Bohemia and Austria, to his brother Matthias. Matthias, who became emperor in 1612, ceded Bohemia and Hungary to his cousin Ferdinand, son of the

* Let others war; do thou, Austria, make fortunate marriages.

Archduke Charles of Styria, third son of Maximilian II. Matthias lived to see the outbreak of the Thirty Years' War (q.v.), and died in 1619.

Bohemia refused to acknowledge his successor, Ferdinand II. (q.v.), to whom all the Austrian possessions had again reverted, and chose the Elector Palatine, Frederick V., the head of the Protestant Union, as king. This election gave the signal for the Thirty Years' War (q.v.), in which the House of Austria took the lead, both as the champion of Catholicism, and the head of a power which aimed at universal domination in Germany and in the Christian world. The battle of Prague (1620) subjected Bohemia to Ferdinand, who formally set about rooting out Protestantism in that country and in Moravia. The emperor also succeeded in extorting acknowledgment of his sovereignty from the States of Austria; and here, too, Protestantism, which had made great progress since the time of Luther, was mercilessly suppressed. Under Ferdinand's successor, the Emperor Ferdinand III. (1637-1657), Austria continued to be a theatre of war; and at the peace of Westphalia (1648), had to cede Alsace to France. Ferdinand III.'s son and successor, Leopold I., provoked the Hungarians to rebellion by his severity. Tekeli (q.v.) received aid from the Porte, and Kara Mustapha besieged Vienna (1683), which was rescued only by an army of Poles and Germans under John Sobieski hastening to its assistance. After this great deliverance of Vienna, the Turkish power continually declined. In 1686 they lost Buda, after having occupied it for nearly 150 years. Repeated defeats from the Austrian troops under Louis of Baden and the famous Prince Eugene compelled them to submit to the treaty of Carlowitz (1699), by which they were almost entirely cleared out of Hungary, Transylvania, and Croatia, and the Hapsburg dominions advanced nearly to their ultimate frontiers. The struggle between Leopold and Louis XIV. of France for the heirship to the king of Spain, led to the war of the Spanish Succession (q.v.), during which Leopold died in 1705. He was of sluggish phlegmatic character, and wholly under the influence of the Jesuits.

His eldest son and successor, the enlightened Joseph I. (q.v.), continued the war. He died childless in 1711, and was succeeded by his brother, Charles VI. The peace of Rastadt, which concluded the war of the Spanish Succession in 1714, secured to Austria the Netherlands, Milan, Mantua, Naples, and Sicily. In the following years, its power on the Lower Danube was extended by the great victories of Prince Eugene, who completely defeated the Turks, took Belgrade, and compelled them to accept the disadvantageous peace of Passarowitz (1718). But these advantages were lost in a subsequent war, concluded by the peace of Belgrade (1739), when that fortress and other conquests of Eugene were restored to Turkey.

With the death of Charles VI., in 1740, the male line of the Hapsburgs became extinct, and his daughter, Maria Theresa, who was married to the Duke of Lorraine, assumed the government. For many years it had been the aim of Charles to secure the adhesion of the European powers to the Pragmatic Sanction, by which the possessions of the Austrian crown should pass to Maria Theresa. Those powers during his lifetime had promised to second his wishes, but he was no sooner in his grave than nearly all of them sought to profit by the accession of a female sovereign. A great war arose, in which England alone sided with Maria. Frederick II. of Prussia conquered Silesia. The Elector of Bavaria was crowned king of Bohemia, and elected emperor as Charles VII. in 1742. The Hungarians, however, stood by their heroic queen,

who was soon able to wage a fairly successful war against her numerous foes. At the general peace of Aix-la-Chapelle in 1748, the power of Austria remained unbroken, except that it had been obliged to give up Silesia to Prussia, and a few districts of Northern Italy to her rivals there. At the death of Charles VII. in 1745, the husband of Maria Theresa was elected emperor of Germany as Francis I. The empress-queen, however, was not content with the loss of Silesia, and in 1756 entered into alliance with France, Russia, Saxony, and Sweden against Frederick. The result of the Seven Years' War (q.v.), which now ensued, was to confirm Prussia in the possession of Silesia. At Francis's death (1765), his son, Joseph II., became German emperor, and joint-regent with his mother of the hereditary states. Collateral branches of the House of Austria sprang from the younger sons of Maria Theresa, the Archduke Leopold in Tuscany, and the Archduke Ferdinand, who married the heiress of Este (see MODENA). In the first partition of Poland (1772), Austria acquired Galicia and Lodomeria, and the Bukovina was ceded by the Porte in 1777. At the death of the empress in 1780, the monarchy had an extent of 234,000 sq. m., with a pop. of 24 millions, and a debt of 160 million florins. The administration of Maria Theresa was distinguished by unwonted unity and vigour, both in home and foreign affairs.

Her successor, Joseph II., was an active reformer in the spirit of the enlightened despotism of the times; though often rash and violent in his mode of proceeding. He introduced economy into every department, relaxed the censorship of the press, granted liberties and rights to Protestants, abolished a great number of monasteries, and revised the school system. His protective system of duties, though exhibiting his narrowness as a statesman, gave a start to native manufactures. But his reforming zeal and passion for uniformity excited opposition; the Netherlands rose in insurrection, and other disturbances broke out, which hastened his end (1790). He was succeeded in the government by his brother, the Grand-duke of Tuscany—as German emperor, Leopold II.—who succeeded in pacifying the Netherlands and Hungary. The fate of his sister, Marie Antoinette, and her husband, Louis XVI., led Leopold to an alliance with Prussia against France; but he died in 1792 before the war broke out. War was declared by France on his son, Francis II., the same year (see FRANCE). By the treaty of Campo Formio (q.v.), 1797, Austria lost Lombardy and the Netherlands, receiving in lieu the Venetian territory. In 1795, at the second partition of Poland, it had been augmented by West Galicia. Francis, in alliance with Russia, renewed the war with France in 1799, which was ended by the peace of Lunéville. It is needless to follow all the alterations of boundary that the Austrian dominions underwent during these wars. The most serious was at the peace of Vienna (1809), which cost Austria 42,000 sq. m. of territory, and 11 million florins of her revenue. It was in 1804, when Napoleon had been proclaimed emperor of France, that Francis declared himself hereditary emperor of Austria as Francis I. On the establishment of the Confederation of the Rhine, he laid down the dignity of German emperor, which his family had held for nearly four hundred years.

The humiliating peace of Vienna was followed (1809) by the marriage of Napoleon with the Archduchess Maria Louisa; and in 1812 Austria figured as the ally of Napoleon in his great campaign against Russia, but she did not give much active assistance. In August of the following year, Austria joined the grand alliance against France.

and the Austrian general, Schwarzenberg, was intrusted with the chief command of the allied forces, which at the battle of Leipzig and in the campaign of 1814 broke the power of Napoleon. The sacrifices and great services rendered by Austria in the gigantic struggle received full consideration at the treaty of Vienna (1815). As recompense for the loss of the Netherlands she received Venice and Dalmatia, which afforded an outlet for her foreign trade.

After that time, Austria exerted a powerful influence in European politics generally, and more especially in the German Confederation, of which her emperor was president; and that influence was uniformly hostile to constitutionalism (see METTERNICH). The death of Francis I. in 1835 made little alteration in the policy of Austria; Ferdinand I. trod in his father's footsteps. The political alliance with Russia and Prussia was drawn closer by a personal conference of the emperor with Nicholas I. and Frederick-William III. at Teplitz in 1835. The wonted calm was interrupted in 1840 by the war against Ibrahim Pasha in Syria, in which Austria took part in union with England.

But during this long peace, the internal condition of the empire was coming to a crisis. The stifling bureaucratic system of government and police supervision had produced only irritation and discontent, and was powerless to keep down the fermentation. A Polish insurrection in 1846 led to the incorporation of Cracow with the monarchy. But the opposition to Austrian rule in Italy, Hungary, and Bohemia became uncontrollable; even in Lower Austria the Estates were among the foremost to urge reform in the direction of constitutionalism. In Austria, the revolutionary period of 1848-49 was one of exceptional severity, the movement for constitutional freedom being complicated by the revival of the national spirit in Hungary, Italy, and Bohemia. The time was everywhere ripe for revolt, when the fall of Louis-Philippe (February 24, 1848) gave the signal for the outbreak of the revolutionary elements all over Europe. Nowhere was the spirit of change stronger than in Vienna, which for many months became a scene of confusion. A period of addresses and petitions for liberal reform was, in March, followed by a popular movement in the capital, to which the government and military, after a feeble resistance, succumbed. The downfall of the old system was marked by the flight of Metternich to England, by the arming of the citizens, by the granting of the freedom of the press, and other popular measures. At the same time, the opposition in Hungary had carried their demand for an independent ministry responsible to a national diet, and the emperor was not in a position to withstand it. The 22d of March saw the insurrection break out at Milan, and Radetzky, the military commander, forced to retire on Verona. Venice rose at the same time, and drove out the Austrians. The Austrian power and system of government had in fact broken down.

The central power at Vienna was in a state of collapse, and the authority passed into the hands of the national guards and the students' legion (the *Aula*). Further troubles in the capital led to the flight of the court to Innsbruck. A Slavic insurrection broke out in Prague after Easter, which, however, was repressed with bloody severity by Prince Windischgrätz. While the emperor was lingering at Innsbruck, leaving Vienna in the power of the populace, and the Hungarians were pursuing an independent course, it was in Italy that the power of Austria began to recover ground. Radetzky had at first been reduced to maintain a defensive position at Verona, against the revolutionary forces led by Charles-Albert

of Sardinia. But in the course of the summer he took the offensive against the Sardinians, and defeated them at Custoza. The fruits of the victory were the dissolution of Charles-Albert's army, and a truce which again delivered Lombardy to Austria.

In the meantime, the government at Vienna was more powerless than ever. The emperor remained at Innsbruck, and a constituent diet was opened in July by the Archduke John, as his representative. But order was never permanently restored, and affairs were brought to a crisis by the proceedings in Hungary. Jellachich, Ban of Croatia, refused obedience to the Hungarian government, a course which, while openly condemned, was secretly encouraged by the Austrian court. The Archduke Palatine, Stephen, left Hungary, after a last attempt at conciliation; and the emperor, who had returned to Vienna after repeated invitations, named Count Lamberg commissioner, with the supreme command in Hungary. Lamberg, however, was murdered on the bridge of Pesth (September 28). Though the dissolution of the Hungarian parliament was now declared, it continued its sittings, and appointed Kossuth president of the committee of defence. The leaders of the popular movement in Vienna were in sympathy with Hungary, and when the imperial troops were ordered to suppress the national rising there, the citizens again rose in insurrection. The arsenal was stormed, and the war-minister, Latour, murdered; the court fled to Olmütz, a committee of safety was appointed, the armed populace organised, and the Polish general, Bem, put at the head of military affairs. In the meantime, the military forces had withdrawn from the capital, and joined Jellachich, in order to prevent the Hungarians coming to the aid of the Viennese. Windischgrätz now laid siege to the capital, which surrendered at the end of October, after a resistance of eight days. The reaction was triumphant, and the leaders of revolt severely punished; but as Ferdinand had not shown sufficient vigour in the great crisis, he was persuaded to abdicate, and Francis-Joseph was declared emperor at the age of 18. Thus restored, the central authority had now to assert itself in Hungary and to complete the reconquest of Northern Italy. In the former country, the imperial troops had at first met with great success and retaken the capital, but they could not maintain themselves there. In Italy, Radetzky made his rapid and decisive campaign of 1849, and, by the victory of Novara, completed the overthrow of Sardinia. With the surrender of Venice, which took place in August, the subjugation of Italy was complete. At the same time, in the National Assembly at Frankfort, Austria opposed the project of a confederation of states under the leadership of Prussia, and managed to thwart the conferring of the empire of Germany on the Prussian king.

In Hungary, the Magyars, though the Germans and Slavs within the country itself were hostile to them, began the campaign of 1849 with decided success. Bem conquered Transylvania. These and other successes encouraged Kossuth to proclaim the deposition of the House of Hapsburg, and the re-establishment of Hungary as a separate state. Buda was retaken from the imperial troops, which were driven back on Presburg. But the government had already solicited the aid of Russia, whose armies, entering Transylvania and Hungary, added to the imperial cause the irresistible weight of numbers. Surrounded on every side by superior forces, the Hungarians were completely beaten. It was in vain that Kossuth transferred the dictatorship to General Görgei (q.v.). Görgei, whether from treachery, as the other Magyar leaders maintained, or from necessity, as he himself averred, laid down

his arms to the Russians at Vilagos (August 13). The surrender of Komorn, in September, completed the subjugation of Hungary, which was treated as a conquered country.

The ten years which followed on the revolutionary troubles of 1848 were a period of reaction and of absolutism. A constitution which had been granted in 1849 was soon annulled. The policy pursued was one of strong centralisation under a bureaucratic government, by which the claims of nationality and of freedom were alike disregarded. Liberty of the press and trial by jury were set aside. A rigorous system of police was maintained. The aim was to Germanise the whole empire and to crush the aspirations of both Slavs and Hungarians. As the Catholic Church pronounced against national freedom, and supported the central authority, it received the greatest privileges by the Concordat of 1855. The result of all these proceedings was only to irritate the national feeling in Hungary, Italy, and Bohemia. The finances, too, notwithstanding vigorous measures for improving the material resources of the country, continued in a bad state, so that incessant loans were required to cover the current deficit.

On the confused arena of German politics, the struggle for ascendancy was kept up between Austria and Prussia. In 1850 the two powers were armed and ready to come to blows with reference to the affairs of Hesse-Cassel (q.v.); but the bold and determined policy of Schwarzenberg prevailed, and by the humiliating arrangement of Olmutz, Prussia gave way (see GERMANY). For a few years longer the preponderance of Austria in the German Confederation was secured.

During the Crimean war, Austria had a very difficult part to play. It felt its indebtedness on the one hand to Russia for help in the great crisis of 1849, on the other it could not without uneasiness see the development of Russian power in the Balkan Peninsula. It occupied the Danubian principalities with the consent of Turkey, but otherwise remained neutral in action. Yet its whole influence was thrown into the scale against Russia. The Crimean war was not brought to a termination without disclosing a power which was to break the Austrian domination in Italy. Under the leadership of Cavour, Sardinia had taken part in the war, and had again brought the Italian question to the front. The rule of Austria in Italy had always been unsatisfactory. From her own provinces in Venice and Lombardy she controlled the policy of the courts of Central and Southern Italy, and her influence tended invariably towards the suppression of national feeling and popular liberty. Sardinia was the only state that worthily represented the spirit of the Italian people. In the spring of 1859 it began to arm against Austrian supremacy. Austria demanded immediate disarmament, on pain of war; but Sardinia refused. Austria accordingly commenced hostilities by crossing the Ticino at the end of April 1859. Sardinia having secured the aid of France, the Austrians were defeated at Magenta, Solferino, and elsewhere, and their emperor was fain to seek an armistice from Napoleon. On the 11th July, the two potentates met at Villafranca, and concluded a peace, ceding Lombardy to Sardinia (see ITALY). Venice was all that still remained of the Italian possessions of Austria, except the Trentino and parts of the Adriatic coast regions.

The rivalry of Prussia and Austria for influence in the Germanic body of states dated from the rise of Prussia to be a leading power. The arrangement of Olmütz in 1850 had left a painful feeling of humiliation in the minds of Prussian statesmen. In 1864 the combined Prussian and Austrian forces drove the Danes out of Sles-

wick-Holstein, but the two victors quarrelled about the subsequent arrangements. War was declared, and in 1866 the Austrian armies in Bohemia were completely beaten by the Prussians, in a campaign of seven days, which closed with the great defeat of Koniggratz or Sadowa. The middle states of Germany which supported Austria were occupied by Prussia. Sardinia, which had formed an alliance with Prussia, was, however, defeated at Custozza. The result of the contest was to exclude Austria from Germany, and she had to hand over to Sardinia the province of Venetia, a cession by which she was all but excluded from Italy. Thus was Austria finally shut out from the scene where for generations she had not unsuccessfully striven to uphold her supremacy. The sphere of development remaining to her was to be found in her own circle of states and in the East.

From the great war of 1866 to that of 1914, the history of Austria was concerned chiefly with two important interests. In the first place, the government had to attempt an arrangement of the conflicting claims and rights of the peoples constituting the monarchy; in the second place, it had to establish working relations with the great neighbouring powers, Germany and Russia, and especially with the latter on the Eastern Question. After the collapse of 1866, the most enlightened Austrian statesmen saw that the true policy of the empire could no longer consist in repressing national claims and constitutional freedom. During the last war, the feeling in Hungary had been lukewarm, and even actively hostile to Austria. The Saxon Count Beust, who was now called to be the head of the Austrian foreign office, advised that an understanding with Hungary was essential. The same policy found a firm and judicious advocate in Francis Deák, an influential Hungarian. The political independence of Hungary was recognised; and the emperor was crowned king at Pesth in accordance with the old historic rites (1867). Soon thereafter he sanctioned the decisions of the Hungarian Diet concerning the relations of the kingdom of Hungary with the other countries of the empire. Such was the famous *Ausgleich*, or agreement between Hungary and Austria Proper. For the dual system thus established, see AUSTRIA-HUNGARY. Within the territories of Austria Proper there followed a development of constitutional freedom. At the end of 1867 the first parliamentary ministry in Cisleithania was formed. The Concordat was set aside. Education was freed from the control of the Catholic Church. Marriage was placed under the jurisdiction of the civil power. The press laws were relaxed. The franchise reform of 1896, though it gave votes to nearly all males, retained the division into electoral classes. Socialism gained ground, and won universal male suffrage in 1907.

From the War (q.v.) of 1914-18 Austria emerged defeated and exhausted, obliged to acquiesce in the loss even of some of her German districts (central Tyrol, the borders of Bohemia, &c.), and of course of her Italian, Slovene, Rumanian, Ruthenian, Polish, and Czech elements. Of her 'crown-lands,' Bukovina, Galicia, Silesia, Moravia, Bohemia, Carniola, Görz and Gradiska, Istria, Trieste, and Dalmatia were reft from her, with the greater part of Tyrol, much of Styria, and the corners of Carinthia. On the other hand, part of German West Hungary (Burgenland) became Austrian; and Austria, with a democratic republican constitution (see above) and a homogeneous population, was freed from her most troublesome political problems. Economic difficulties, however, became very threatening. Vienna, one of the world's greatest cities, was a misfit as the capital of a small country, and cohesion between capital

and lands was wanting. Dr Michael Hainisch, a prominent writer on economic subjects, was elected president in 1920. Fears of monarchist troubles were allayed by the failure of the dethroned Kaiser Karl's two attempts to recover the crown of Hungary, and his death soon after. Attempts of Austria as a whole and of the lands separately to unite with Germany were vetoed by the Allies under French influence. Germany was compelled to change an article in her constitution that contemplated the future inclusion of Austria. After the Klagenfurt district, in accordance with the treaty of Saint-Germain, had decided by plebiscite to be Austrian, a Yugoslav force took possession, but withdrew under pressure from the allied powers. Another of Austria's neighbours, Hungary, resisted the fulfilment of the treaty by refusing to give up Burgenland. A compromise was at last agreed to, whereby a plebiscite was to be held in and around Oedenburg, and the rest of the region was handed over. The plebiscite was held under conditions which Austria could not accept, and Hungary retained Oedenburg (1921).

Austria, LOWER, OSTERREICH UNTER DER ENNS, or NIEDEROSTERREICH, a land of the republic of Austria, formerly a crown-land and archduchy of the Austrian Empire, includes the original Eastern Mark, or march, of the Germans against the Slavs from which Austria takes its name, and with Upper Austria came to form an archduchy which was the nucleus of the Austrian Empire. Vienna since the revolution has been detached, leaving an area of 7441 square miles, and a population (1920) of 1,457,335, nearly all Germans, with a few Czechs and others. The Danube crosses Lower Austria from west to east. North of its plains is hilly country, merging in the plateau of Moravia. The south is occupied by the eastern end of the Alps, rising to 6800 feet in the Schneeberg. Lower Austria has many manufactures, and is the most thickly peopled land of the republic. The towns include Wiener Neustadt, Sankt-Polten, and Baden.

Austria, UPPER, OSTERREICH OB DER ENNS, or OBEROSTERREICH, a land of the Austrian republic, formerly a crown-land and archduchy of the Austrian Empire, once part (with Lower Austria) of the archduchy of Austria, has an area of 4625 square miles, and a population (1920) of 858,795. The Danube separates a small northern mountainous region from the Alps. In the south the Salzkaunmergut projects between Styria and Salzburg. The land is fertile, rich in minerals (notably salt), and cattle-breeding, forestry, and metal and other industries are practised. There is much fine scenery. The capital is Linz; other towns are Steyr and Wels.

Austria-Hungary, one of the six great powers of Europe, had been at the time of its dissolution in 1918 for half a century organised as a Dual Monarchy, consisting of a German Cisleithan moiety (usually called the Austrian Empire, officially 'the kingdoms and lands represented in the Reichsrath') and a Magyar Transleithan (the Kingdom of Hungary in its wider sense, otherwise called 'the lands of the Crown of St Stephen' or 'of the Hungarian Crown'). To these a third region was added by the annexation of Bosnia-Herzegovina in 1908, but the monarchy remained dual notwithstanding the grant of a constitution to the new territory in 1910. The custom of speaking of the whole as 'Austria' was much resented by the Magyars, who pointed out that the regions on either side of the Leitha were associated on equal terms, that Vienna was no more the capital of Austria-Hungary than was Budapest, and that Austria's precedence was merely alphabetical. Towards the end, indeed,

Hungary's political influence was on the whole stronger than Austria's for a time. Both Austria and Hungary had long been subject to the Hapsburgs before the Ausgleich of 1867 stabilised their relations to each other; but it is most convenient to deal with them in separate articles, to which the reader is referred for description and history. Further information may be sought in the articles on those states which were formed out of or augmented by the wreckage of 1918. The present article deals mainly with the history of Austria-Hungary in 1867-1918 and the forces that conditioned its existence.

In 1910, the date of the last census before its break-up, Austria-Hungary had a population of 51,340,378, and an area of 261,239 square miles, thus divided:

I. AUSTRIA—	Sq. Miles	Population.
Lower Austria	7658	3,530,698
Upper Austria	4628	852,667
Salzburg	2768	214,997
Styria	8662	1,441,604
Carinthia	3989	394,785
Carniola	3845	525,083
Kustenland (Coastland) { Trieste and territory ..	36	220,475
Goiz and Gradisca ..	1180	261,721
Istria	1911	403,261
Tyrol	10,802	946,498
Vorarlberg	992	145,794
Bohemia	20,065	6,774,309
Moravia	8584	2,620,904
Silesia	1988	756,590
Galicia	30,321	8,022,126
Bukovina	4038	801,364
Dalmatia	4956	640,062
Total for Austria	115,862	28,567,598
II. HUNGARY—		
Hungary Proper (including Transylvania and Fiume)	109,188	18,221,367
Croatia-Slavonia	16,421	2,619,291
Total for Hungary	125,609	20,840,678
III. BOSNIA-HERZEGOVINA	10,768	1,981,802
Total for Monarchy	261,239	51,340,378

The Austro-Hungarian dominions formed geographically a compact territory, with an area greater than that of any European state save Russia, and more than twice that of Great Britain and Ireland. The body of the monarchy lay in the interior of Europe, though it had about 500 miles of sea-coast on the Adriatic, not including the coasts of the numerous islands. Austria-Hungary bordered on Italy, Switzerland, Liechtenstein, Bavaria, Saxony, Prussia, Russia, Rumania, Serbia, Turkey (till the Balkan wars), and Montenegro. The Turkish provinces of Bosnia and Herzegovina, thenceforward occupied and administered by Austria, were annexed by proclamation in 1908, when the Sanjak of Novi-Bazar, which had been in military occupation, was restored to Turkey.

The military system of Austria-Hungary resembled that of Germany under the empire, but differed on account of the dual nature of the monarchy. The common army was administered by the Common War Office, of which the Common War Minister was at the head; but the Austrian Landwehr and Landsturm were in charge of the Austrian and the corresponding Hungarian forces of the Hungarian Defence Minister. Each of these five bodies had its Ersatz. Bosnia-Herzegovina had no Landwehr. Military service was compulsory, and usually began about the age of twenty. After two or three years with the colours, either in the common army or, if its numbers were completed, in the Landwehr, men passed to the Landwehr reserve (Bosnians to the common army reserve). Those not required for common army or Landwehr went at once to the Ersatz. In all cases after twelve years' service men passed to the Landsturm, and remained to the age of forty-two.

The navy was chiefly a coast-defence force, with a flotilla on the Danube. It was administered by

the Common Ministry of War, and recruited partly voluntarily, partly by a levy on the seafaring population. The men had four years of active service, five in the reserve, and three in the Seewehr. The headquarters of the fleet were at Pola. There was an arsenal at Trieste, and there were various other establishments on the Dalmatian coast.

In foreign affairs Austria-Hungary's chief aim was to find a *modus vivendi* with Germany and Russia, and after 1871 Bismarck arranged between Germany, Austria, and Russia a 'Three-Emperors-Alliance' (Dreikaiserbund). After the Russo-Turkish war of 1877-78 it was superseded by an alliance between Germany and Austria, which in 1882 became the Triple Alliance by the accession of Italy, in spite of the *Italia Irredenta* difficulty. The German alliance was of use in the crisis that arose when Count Aehrenthal, after the Turkish revolution of 1908, annexed the Turkish provinces of Bosnia and Herzegovina, which the treaty of Berlin had placed under Austro-Hungarian administration in 1878. When the growing strength of Austria-Hungary's neighbour Serbia led at last to war in 1914, the allies of both were involved, but Italy seceded. Both Italy and Rumania, divided in their interests, intervened against Austria-Hungary. See WAR (GREAT).

The population embraced a greater number of peoples, distinct in origin and language, than that of any other European country except Russia. The Slavs were collectively the most numerous, amounting to nearly half. They formed the bulk of the population of Bohemia, Moravia, Galicia, Carniola, Dalmatia, Croatia, Slavonia, Bosnia-Herzegovina, the Voivodina, and the north of Hungary. They were, however, split up into a number of peoples, differing greatly in language, religion, culture, and manners; so that their seeming preponderance was lost. The chief branches of the Slav stem were, in the north, Czechs or Bohemians (the most numerous of all, including the Slovaks), Poles, and Ruthenians; and in the south, the Slovenians and Serbo-Croatians (together called Yugoslavs or South Slavs). The Germans numbered above one-fourth, dispersed over the monarchy, but predominating most in Lower and Upper Austria, Salzburg, Tyrol, Styria, Carinthia, and the west of Hungary (Burgenland, now mostly Austrian), with isolated colonies, of which the largest were in Transylvania and around Gottschee. The Romance peoples amounted to fully 8 per cent., and were divided into western and eastern. The western consisted of Italians, inhabiting the south of Tyrol, western Istria, and parts of Dalmatia; the Ladins (Latins), occupying some valleys in Tyrol; and the Friulians about Görz, north of Trieste. The eastern Romance people were the Rumanians, in Transylvania, Hungary, the Voivodina, and the Bukovina. The Magyars, or Hungarians proper, numbered about one-fifth, located chiefly in Hungary and Transylvania. The small remaining portion was composed chiefly of Jews, Armenians, and Gipsies.

The literature of the principal languages will be found discussed under GERMANY, HUNGARY, CZECHOSLOVAKIA. See also ITALY, POLAND, ROMANIA, RUTHENIAN, SERBIA, SLAVS.

Austria-Hungary was a monarchy hereditary in the House of Hapsburg-Lorraine. In the case of the reigning family dying out, the states of Bohemia and of Hungary had the right of choosing a new king; but for the other crown-lands, the last sovereign was to appoint his own successor. The reigning house must profess the Roman Catholic faith.

Till 1848 Hungary and Transylvania had a constitution limiting the monarchy, which was absolute elsewhere; though the several provinces had each its consultative council composed of

clergy, nobles, and burghers. After the Revolution of 1848, and the subsequent reaction, all marks of independence of the separate provinces disappeared. The imperial constitution granted March 4, 1849, and the provincial constitutions that followed, were abolished, and government was organised in the most absolute form by the imperial letters-patent of December 31, 1851. The different provinces of the monarchy were divided into circles, the chiefs of which were nominated by the central authority. All the machinery of a free and constitutional government was set aside. In order to support itself in this course, the government had to seek aid from the Catholic Church, with which it established the concordat of 1855. By this agreement with Rome Catholicism became a privileged religion, with control of education and of the censorship of books. Thus the reaction was complete. Of the reforms of 1848 there remained only one of importance, the abolition of serfdom.

After the loss of most of the Italian provinces (see AUSTRIA, ITALY), a constitution for the whole of the Hapsburg dominions was tried in 1861, but failed in face of opposition from Magyars, Czechs, and others. Then came the defeat of Austria by Prussia, which meant not merely loss of Venice, but a new orientation of external policy, and an altered balance among the several nationalities within her borders. It was necessary to come to terms with the Magyars. This was done by the famous *Ausgleich* of 1867, which organised Austria-Hungary as a Dual Monarchy, with Germans predominant in the Austrian Empire, and Magyars in the Apostolic Kingdom. Each of the two states had its own laws, parliament, ministers, and government. Besides the sovereign there was a link in the Delegations, practically committees of the two parliaments, which deliberated independently, communicated in writing, and met in Vienna and Budapest alternately. The Delegations controlled foreign affairs, army and navy (but not the Landwehr and levy-in-mass), and finance connected with common affairs. To the common finance minister was afterwards assigned the administration of Bosnia-Herzegovina. The proportion in which the two countries contributed to common expenses was negotiated periodically by 'quota-deputations,' but the money was voted by the two parliaments separately. Practically Austria-Hungary formed a customs union (including Liechtenstein, but excluding certain small border districts in the west); but this arrangement had to be renewed every ten years, not without wranglings and unconstitutional makeshifts. From 1897 especially, the Hungarians contended that their contribution to common revenue was unduly great. From 1903 onwards Hungarian separatism became so menacing that, after a series of deadlocks and crises, the government threatened by franchise reform to submerge the Magyar oligarchy, which, loud in its cries for freedom for the Magyars, had long sought to Magyarise the Slavs, Germans, and Rumanians under the crown of St Stephen. Nevertheless the old illiberal system continued. In Austria, however, the advance of Socialism amidst the welter of conflicting nationalisms helped to achieve universal male suffrage in 1907. Austria, moreover, had meanwhile made such concessions to the Slavs that it was no longer so predominantly German as Hungary was Magyar in government. The Poles naturally showed less inclination to turn their eyes towards Russia than the other Slavs; indeed, the Poles were better pleased, the hope of independence being remote, with the Austrians than with their other masters; and they were kept out of mischief by having a free hand in Galicia to keep the Ruthenes under.

Even so, the Ruthenes were better off than their kindred in Russian Ukraine. The Czechs insisted on the old historic rights of the kingdom of Bohemia, but without success; for, besides other reasons, the question was complicated by the large German population of Bohemia. Thus an attempt at federalism in 1871 failed, though the restoration of the kingdom of Bohemia and the coronation of the emperor-king at Prague had been promised.

But the great weakness of the Monarchy was in the south. The Serbo-Croats, divided among Austria (Dalmatia and Istria), Hungary (Voivodina, Croatia, and Slavonia), Austria-Hungary jointly (Bosnia-Herzegovina, till 1908 nominally Turkish), the two independent states of Serbia and Montenegro, and Turkey (Old Serbia), became more and more conscious of Serbo-Croat nationality, with or without the Slovenes. Union of the South Slavs seemed more practicable within the Monarchy than without, and Trialism (the turning of the Dual into a Trial Monarchy, with its third capital at Agram) seemed to gain ground against Pan-Serbism. Moreover, the closing of westward doors by the disastrous wars against Italy and Prussia had turned Austria-Hungary's face towards the south-east, where Serbia blocked the way. The occupation of Bosnia-Herzegovina in 1878 was a move against the Serbs. Its annexation, hastened by the Turkish revolution of 1908, was a blow to Pan-Serbism. Oppression in Croatia was intensified. The Balkan wars of 1912-13 eliminated Turkey and aggrandised the Serb kingdoms, though by the erection of an independent Albania Austria succeeded in keeping them practically blocked out from the sea.

Trialism found some favour with the Czechs as a step towards federalism; the Germans were coming to look upon it as a means of ridding Austria of its Slav majority; and it was understood to be the Archduke Franz Ferdinand's intention to try it when he should succeed to the throne. The connection of these facts with the archduke's murder at Serajevo is obscure. Austria-Hungary's part in the war that ensued is dealt with in the article thereon. During the war repression drove the Yugoslavs to the Pan-Serbian solution of their problem. Imprisonment and internment were met by flight and by wholesale surrenders and desertions to the enemy. Serbia became the kingdom of the Serbs, Croats, and Slovenes. Czechoslovaks also went over in great numbers. Their anti-Bolshevik adventure in Siberia helped to win them recognition as a nation on the part of the Allies. This was withheld from the Ruthenians, who were left subject to Poles, Czechoslovaks, and Rumanians. The Poles, promised independence by all parties, formed a united republic. Rumania and Italy obtained their *irredenta* territory, with considerable foreign minorities, Fiume falling ultimately to Italy (1924). The Hapsburg monarchy did not long survive Franz Joseph, who died in 1916. Peace was made separately with the Austrian republic and with a much-curtailed Hungary, which, though it soon declared itself to be a kingdom, refused to receive back Karl, the last of the Hapsburg king-emperors.

Austrian Succession. See SUCCESSION WARS.

Autacoids. See HORMONES.

Anteuil, formerly a country village at the entrance of the Bois de Boulogne, now part of Paris. Boileau and Molière lived there. It has a well-known racecourse.

Authentic Modes, church modes having all sounds within the octave of the final or keynote. In the Plagal Modes founded on them the range is from the fourth below to the fifth above the final.

Auto (Sp. and Port. from Lat. *actus*, 'act'), a word specially applied to the religious plays of Spain and Portugal from the Middle Ages onward, similar to the English miracles and moralities. The *auto sacramental* was a Eucharistic representation, connected from the 13th century with the celebration of Corpus Christi. Liturgical in origin, like the English drama, the Spanish drama had a parallel development, but the religious type survived alongside later forms. The *autos sacramentales* became elaborate popular allegorical plays, combined with farcical interludes. They were written in Portugal by Gil Vicente, in Spain by Juan de Encina, Lope de Vega, Calderón, and Gabriel Tellez. Their representation was forbidden in Spain in 1765, but continued in Portugal and Spanish America.

Autobiography. See BIOGRAPHY.

Autochthones, the Greek name for the original inhabitants of a country, not settlers, considered as having sprung from the soil itself. The Athenians were fond of being so called; the ancients counted also among autochthonous races the Arcadians, Latins, Gauls, and Scythians. The Latin equivalent term was *aborigines*.

Auto/cracy is that form of government in which the sovereign unites in himself the legislative and the executive powers of the state, and thus rules uncontrolled, or but little controlled, by constitutional restraints, or the recognised authority of councils or parliaments. All truly 'oriental' governments were of this type; in European countries the absolutism of the sovereign has been everywhere balanced or regulated in some way, if not abolished. In Russia, where the sovereign actually called himself 'Autocrat,' almost pure autocracy lingered longest. But even the most rigorous autocrat must in practice have regarded the convictions, prejudices, or intrigues of his advisers and officials, his nobles, his court, his bureaucracy. There are real though not formal checks. In autocratic states, palace or court revolutions are not infrequent. See ABSOLUTISM, FEUDALISM, GOVERNMENT.

Auto da Fé (Port., 'act of the faith;') Span. *Auto de Fé*) was the name given to the solemnity that from 1481 used to take place in Spain and Portugal at the execution of heretics condemned to death by the Inquisition. It was generally held on a Sunday between Whitsunday and Advent, very often on All-Saints' Day. At dawn, the dismal tolling of the great bell of the church gave the signal to begin the drama of the day; for as such it was looked upon by the people, who thronged to it in troops, believing that they did a good work in merely looking on. Men of the highest rank reckoned it prudent to give their countenance to the 'holy' tribunal at these processions, and even grandees of Castile did not disdain to make themselves familiars of the Inquisition. The procession was led by the Dominicans, carrying the flag of the Inquisition; next followed the penitents, on whom only penance had been laid; behind them, and separated by a great cross which was borne before, came those condemned to death—barefoot, clad in robes painted with hideous figures called the Sanbenito, and with a pointed cap on the head; then, effigies of fugitives; and lastly, the bones of dead culprits, in black coffins painted with flames and hellish symbols. The frightful train was closed by an army of priests and monks. The procession went through the principal streets to the church, where, after a sermon on the true faith, the sentence was announced, the accused standing meantime before a crucifix with extinguished torches in their hands. After the sentence had been read to them, an officer of the Inquisition gave each of the condemned a blow on the breast

with his hand, as a sign that they were given over by that tribunal to the secular power; on which a secular officer took them in charge, had them fettered, and taken to prison. A few hours afterwards, they were brought to the place of execution. If they yet, at the last, made profession of the Catholic faith, they were so far favoured as to be first strangled; otherwise, they were burned alive, and with them the effigies and bones of the fugitive and dead culprits. As a rule, the king, along with his whole court, had to exalt by his presence the solemnity of the horrid transaction. The most splendid auto da fé took place at Madrid, under Charles II., in 1680; and so late as 1826 a Jew and a deistical schoolmaster were, the one burned, the other hanged, under the forms of an auto da fé, at Valencia. See INQUISITION.

Autograph (Gr.), something written in a person's own handwriting, and not by an amanuensis, whether a mere signature or a whole manuscript, as opposed to a *copy*. From the 16th century onwards, but especially in modern times, the collection of autographs has become an object of eager pursuit; and consequently since 1801 they have formed a branch of literary trade. The value of autographs is determined by the interest felt in the writer, the scarcity of such relics of him, and the contents of the writing. Besides portraits of famous persons, we naturally wish to possess a specimen of their handwriting, as the peculiarity of the style—the physiognomy of the handwriting—completes our knowledge of their personality. The oldest autograph in the French archives is that of Thierry III., dating from the year 677. The British Museum has an unrivalled collection. The finest modern private collection was that of Mr Alfred Morrison, made in the years 1865–82, of which a descriptive catalogue in 6 volumes, with illustrative fac-similes, was printed in 1883–92. The best collection of American autographs was formed by Dr Emmet, and is now in the New York Public Library. Many private collections number from 5000 to 10,000 items. Forgery (q.v.) of autographs is not infrequent.

Autogravure, a peculiar process of photo-engraving patented by J. R. Sawyer, London, on November 12, 1884. If an ordinary autotype carbon print be placed on silvered copper instead of on paper, the slight relief which the picture possesses is enough to admit of an electrotpe being taken from it. The raised parts of the print become the depressed parts in the electrotpe. Impressions from the latter can therefore be taken in the same way as from an engraved copperplate. See ELECTROMETALLURGY, PHOTOGRAPHY, AUTOTYPE.

Auto-intoxication, poisoning by substances produced within the body, whether ordinary waste-products, results of perverted metabolism, or substances produced by the action of bacteria.

Autolyceus, (1) a son of Hermes, maternal grandfather of Ulysses. He lived on Mount Parnassus, and was famous for his cunning and robberies. Similarly, in Shakespeare's *Winter's Tale*, Autolyceus is a 'snapper-up of unconsidered trifles.'—(2) A Greek astronomer and mathematician of Pitane in Æolia, about 330 B.C., who wrote two works, on the revolving sphere, and on the rising and setting of the fixed stars.

Automatic Machines. See AUTOMATON.

Automatic Writing, or writing produced without the volition of the writer, has been by many considered a communication from the dead, or from other disembodied spirits. Such literature has often, therefore, had a high value set upon it as a revelation, a value often very disproportionate

to its intrinsic worth. The study of the unconscious mind gives another explanation; and of that mind it does indeed reveal much. In some cases telepathy may be at work. See PLANCHETTE.

Automatism (Gr., 'self-movement'), a term applied to the power of initiating vital processes from within the cell, organ, or organism, independently of any direct or immediate stimulus from without. External conditions produce effects within the living matter which may lie dormant for a time, and only subsequently find expression in activities without apparent external stimulus. The heart of a cold-blooded animal like a tortoise may be isolated from the body without interrupting the beat, which will indeed, in certain conditions, continue for days; the conditions of its activity are contained within itself—it is automatic. The highest form of automatism is that exhibited in the will of man and the higher animals—they can act without direct interference from without. But the word, applied to animal life, is often used of that which is involuntary and merely mechanical; especially indicating the Cartesian doctrine, that animals (other than man) are like automata, mere machines, without either the vegetative or sensitive soul allotted to them by Aristotle. See PHYSIOLOGY, NERVOUS SYSTEM, LIFE.

Automaton is derived from two Greek words signifying self-movement, and is usually applied to machinery constructed to represent human or animal actions; 'automatic' used of an apparatus, implies that it does its work with little or no guidance or interference from man, as in a telegraphic 'automatic transmitter.' The construction of automata has occupied the attention of mankind from very early ages. Archytas of Tarentum is reported, so long ago as 400 B.C., to have made a pigeon that could fly. Hero of Alexandria describes in his book upon pneumatics a number of automatic contrivances which depend upon well-known principles. Other ancient writers record similar devices; but it is difficult to understand how these could have been made at a time when technical knowledge was at a low ebb. Many of them doubtless were simple tricks to impose upon the superstitious and credulous. One of the most perfect automata was one constructed by M. Vaucanson, and exhibited in Paris in 1738. It represented a flute-player, which placed its lips against the instrument, and produced the notes with its fingers in precisely the same manner as a human being does. In 1741 M. Vaucanson made a flageolet-player, which with one hand beat a tambourine; and in the same year he produced a duck. This was a most ingenious contrivance, the mechanical duck being made to conduct itself in every respect like its animated pattern. It swam, dived, ate, drank, dressed its wings, &c. as naturally as its live companions; and, most wonderful of all, by means of a solution in the stomach, it was actually made to digest its food! Brewster says of this duck 'that it was perhaps the most wonderful piece of mechanism that was ever made.' This statement is qualified by Robert Houdin, the celebrated conjuror, into whose hands Vaucanson's 'duck' was placed for repair. He found that the so-called 'digestive process' was brought about by a vulgar trick altogether unworthy of its author, who was without doubt a clever mechanic. M. Droz, a Swiss, made for the king of Spain a sheep that bleated, and a dog which guarded a basket of fruit. If any of the fruit was taken away, the dog barked incessantly until it was replaced. He also made a singing-bird, which was ultimately quite eclipsed by another made by Maillardet.

The 'Piping Bullfinch,' first exhibited at the London Exhibition of 1851, was a very perfect example of those automata which imitate the movement and song of birds. This piece of apparatus was a box of the size of a large snuff-box. Upon touching a spring, a tiny bird sprang from it, fluttered its wings, and trilled the true pipe of the bullfinch. The sound in reality came from the box, which contained a small pipe which could be shortened and lengthened by the action of a piston, so as to give different notes. It was controlled by a lever, which was actuated by studs on a small clockwork barrel, the necessary wind being furnished by bellows. It was indeed a very elaborate adaptation of the same principle which actuates the mechanical cuckoo in the well-known Swiss clocks. And in this connection, famous complicated clocks like that in the cathedral of Strasburg deserve mention.

Most of the automata which draw or write have probably been adaptations of the pantograph principle. Houdin's writing and drawing automaton, which made a great sensation in Paris, was set in motion by clockwork.

All previous efforts in the making of automata were surpassed by Mr J. N. Maskelyne. The first one, 'Psycho,' was introduced to public notice in January 1875. This was a seated figure of light construction. During performance it was doubly insulated by being placed on a glass cylinder, which stood upon a small movable platform, furnished with porcelain castors. This arrangement at once negatives the idea that it might be worked by electricity. The figure moved its head, and from a rack in front of it chose the cards necessary for playing a hand at whist, which it played in a masterly manner. It also worked out calculations up to 100,000,000, showing the entire total of each calculation in a box in front by opening a sliding door. It acted without any mechanical connection with anything outside it, and yet was so much under control that it executed all orders intelligently. The nature of this control was so secret that, although Mr Maskelyne's assistants were aware that certain operations produced certain results, they were quite ignorant as to the principle upon which the automaton worked. Zoe (1877) was another automaton which owed its creation to Mr Maskelyne's ingenuity. This was also a sitting figure—insulated, and having no mechanical connection with anything else. During performance there was placed in front of it a sheet of drawing-paper, upon which it traced the likeness of any public character that might be chosen by the spectators from a list of 200 names. Mr Maskelyne also constructed other automata, which played upon musical instruments and performed other surprising feats.

'Automatic machines,' by which, on his 'dropping a penny in the slot,' the passer-by is provided with sweetmeats or other articles, have been of commercial importance since 1890; they are worked by mechanism liberated by the coin. In many Continental towns restaurants have been established in which one can obtain a complete meal from a range of automatic machines, some of which deliver various kinds of sandwiches and the like, while others give forth measured quantities of beer, coffee, and other beverages. Another variety is the penny-in-the-slot gas-meter, in which the insertion of a penny ensures a supply of so many feet of gas. In a wider sense a vast number of machines can be called automatic, inasmuch as, once set agoing, they perform a complicated series of operations without interference.

See Brewster's *Letters on Natural Magic*; Houdin's *Memoirs* and his *Secrets of Conjuring*; Hutton's *Mathematical Recreations*.

Automobile. See MOTOR-CARS, TRACTION-ENGINES.

Autonomy is a polity in which the citizens of any state manage their own government; parishes, corporations, religious sects may also enjoy a limited or local autonomy. Autonomy is often used to designate the characteristic of the political condition of ancient Greece, where every city or town community claimed the right of independent sovereign action. Recently the word is more specifically used of territories or provinces, which, while subject in some matters to a higher sovereignty, are autonomous in other respects. Thus the Treaty of Berlin made Eastern Rumelia an 'autonomous province,' though subject to the direct political and military authority of the sultan, it had, till its union with Bulgaria in 1885, 'administrative autonomy' in all its internal affairs.

Autoplasty (Gr., lit. 'self-formed'), a mode of surgical treatment which consists in replacing a diseased part by means of healthy tissue from another part of the same body. The most familiar instance is the Rhinoplastic or Taliacotian operation for supplying a new nose from the skin of the forehead.

Autopsy (Gr., 'seeing for one's self'), eye-witnessing, a direct observation; but generally used of a Post-mortem (q.v.) examination or dissection of the dead body.

Autosuggestion, a process to which much importance is attached by many psychologists and psychotherapists. The subject himself, formulating an action in his imagination (as by saying to himself words relating to the action), initiates in his unconscious mind a process which issues in action. Even automatic bodily functions can be influenced. Christian Science (q.v.) may be regarded as an application. The method is useful in education also.

Autotomy is the spontaneous detachment of a part of the body when injured or subjected to some other stimulus. It occurs in many animals, notably crustaceans and lizards, and may or may not be followed by Regeneration (q.v.).

Autotype. In this process, a sheet of paper coated with a film of bichromatised gelatine, in which lampblack or other permanent pigment has been held in solution or suspension, is exposed to the action of light, in a printing-frame, beneath an ordinary photograph negative. In proportion as the light is admitted to the gelatine film or 'tissue,' through the negative, it becomes hardened and insoluble in water. The print is afterwards treated by washing away the unaltered portions of the film, and the result is a permanent print of the object photographed. The process is admirably adapted for the reproduction of oil-paintings; and the enormous series of autotypes from the chief works in all the great public galleries of Europe, published by the Messrs Braun of Dornach, near Mülhausen, were epoch-making publications. The process has also been successfully employed for the reproduction of drawings; but where the work to be copied has a perfectly dead surface—as is the case, for instance, with charcoal sketches—the slight gloss possessed by the autotype print is a disadvantage. This objection is still greater in the reproduction of engravings and etchings; and for these the heliogravure process of M. Amand Durand of Paris is preferable, as here a metal plate is prepared by the aid of photography—more or less supplemented by retouchings by the hand with burin or etching-needle—and can be printed in ink and upon paper exactly similar to those of the original engraving or etching which is being copied. Autotypes, and

also heliogravures, can be printed with a margin, without mounting; a great advantage when book illustrations are required, as mounted photographs never preserve a perfectly flat surface, but, with the slightest change of temperature, warp the paper to which they are attached in a most unsightly manner. See PHOTOGRAPHY.

Autumn, the third season of the year, between summer and winter. Astronomically, in the northern hemisphere, it begins at the autumnal equinox, when the sun enters *Libra*, 22d September, and ends at the winter solstice, when the sun enters *Capricorn*, 21st December; but popularly, in Great Britain, it comprises the three months, August, September, and October. According to Litré, it extends in France from the end of August to the first fortnight of November; according to Webster, in North America it includes the months of September, October, and November. In the southern hemisphere it corresponds in time to the northern spring.

Autun, a town in the French department of *Saône-et-Loire*, in the Burgundian district of *Autunois*, situated on the river *Arroux*, 31 miles NW. of *Châlon* by rail. It is the seat of a bishop, and has a fine cathedral (12th century, restored 1865), college, museum, and library, and many ruins of Roman temples, gates, triumphal arches, and other antiquities. Cloth, carpets, and velvet are manufactured, and there is an active trade in horses, corn, and wood. *Autun* was the ancient *Augustodunum*, and has been by many identified with the earlier *Bibracte*, the chief city of the *Ædui*, though it seems more likely that the site of the latter was *Beauvray*, 10 miles distant. Under the Romans it became a famous school of eloquence. It was destroyed by *Tetricus* in 270 A.D., but was rebuilt by *Constantine the Great*. It was burned and pillaged by the *Vandals* in 406, *Burgundians* in 414, *Huns* in 451, *Franks* in 539, and *Saracens* in 739, and nearly destroyed by the *Normans* in 895. In 1379 it was burned by the English. At the Council of *Autun* (1094), *King Philip I.* was excommunicated for divorcing his queen, *Bertha*. The famous *Talleyrand* was bishop of the diocese, and here *Macmahon* was born. Pop. 15,000.

Auvergne, a southern central district of France, was before the Revolution a separate province, and coincided nearly with the modern departments of *Cantal* and *Puy-de-Dôme*. *Auvergne* falls naturally into two divisions—Upper *Auvergne*, to the south, rugged and mountainous; and Lower *Auvergne*, to the north, some parts of which, especially on the left bank of the *Allier*, are distinguished for extraordinary fertility. The climate is subject to violent extremes and great storms, cold in the mountainous districts, whilst in the plains the heat of summer is often oppressive. Not only do the cone and dome-like shapes of the summits betray a volcanic formation, but also the great masses of basalt and trachyte that break through the crust of granite and gneiss, render it manifest that this was a great focus of volcanic action at a comparatively recent period. Among the summits that have apparently been at one time volcanoes, the most remarkable are *Cantal* (6093), *Mont-Dore* (6188), and *Puy-de-Dôme* (4806): all are now covered with verdure. The lava-covered plateaus are desert, but the pulverised volcanic earths that cover the slopes and valleys form a rich and fruitful soil. Agriculture is in a rude and backward condition; but the breeding of cattle, especially of mules, is diligently carried on. *Auvergne* produces iron, lead, copper, and coal, and is rich in valuable mineral springs, both cold and hot.

The *Auvergnats* are a highland people, rude and ungainly, poor, ignorant, and, though of southern temperament, laborious. They are probably the almost unmixed descendants of the ancient inhabitants of this part of Gaul, and speak a dialect of their own. Large numbers of them go to service in Paris and other northern towns, where they are marked by their pronunciation. *Auvergne* has, however, produced distinguished men, such as the *Arnauld* family, *Pascal*, *Lafayette*, and *Polignac*. The chief towns are *Clermont* and *Aurillac* (q.v.). The country derived its name from the Celtic *Avernus* or *Arvernus*, who long defended their fastnesses against *Cæsar*, as later against the *Goths*, *Burgundians*, and *Franks*. Long a separate county, it was not incorporated with France till 1531.

Auxerre (anc. *Autissiodorum*), the chief town of the French department of *Yonne*, stands on the river *Yonne*, 109 miles SE. of Paris by rail, in a rich district abounding in vineyards. It is poorly built, but presents an imposing aspect from a distance, the most prominent feature being the noble Gothic cathedral, which dates from 1215, but was not completed till the 16th century. There are two other interesting churches, a museum, a large library, statues of *Fourier* and *Davout*, &c. *Auxerre* was a flourishing town before the Roman invasion of Gaul. It was destroyed by the *Huns* in 451, and in 486 was wrested by *Clovis* from the *Romans*. The county of *Auxerrois* came finally in 1477 to the kingdom of France. The principal manufactures are wine (a light Burgundy), candles, chemicals and hosiery. Pop. 21,000.

Auxiliaries. See MILITIA, VOLUNTEERS, YEOMANRY, MERCENARIES.

Auxonne, a fortified town in the French department of *Côte d'Or* on the left bank of the *Saône*, 20 miles SE. of *Dijon*. Pop. 7000.

Ava, a ruined city of *Burma*, of which it was the capital from 1364 to 1740, and again from 1822 to 1837. It stands on the left bank of the *Iravadi*, about 6 miles to the SW. of *Amarapura*. *Ava* now is almost a desert, its temples and houses having been reduced to ruins by an earthquake in 1839. On the opposite bank stands *Sagaing*, which has twice been the seat of government.

Ava, Arva, Yava, or *KAVA* (*Piper methysticum*), a plant of the natural order *Piperacæ* (q.v.), possessing narcotic properties. Until recently, it was ranked in the genus *Piper* (*Pepper*). It is a shrubby plant, with heart-shaped, acuminate leaves, and very short, solitary, axillary spikes of flowers. It is a native of many of the South-sea islands, where the inhabitants intoxicate themselves with a fermented liquor prepared from the upper portion of the root and the base of the stem. The rhizome is thick, woody, rugged, and aromatic. The intoxicating liquor is prepared by macerating it in water. The savage *Tahitians* were accustomed to prepare it in a very odious manner; much as the *Indians* of the *Andes* prepare *Chica* or *Maize beer*—chewing the root, depositing it in a bowl, straining through coconut husk, and mixing with water or coconut milk. As the beverage was drunk immediately afterwards, no fermentation could have taken place, and the narcotic property is therefore ascribed to an acrid resin, *Kawine*, which is present in the root. For an account of the manufacture of the beverage, see *Mariner's History of the Tonga Islands*. The taste is unpleasant to those unaccustomed to it, and has been likened to that of rhubarb and magnesia. The intoxication is not like that produced by ardent spirits, but rather a stupefaction like that caused by opium. It is succeeded by a copious perspiration. The habitual use of *ava* causes a whitish scurf

on the skin, which, among the heathen Tahitians, was reckoned a badge of nobility, the common people not being able to indulge freely enough. Aya is, like cocaine, a local anæsthetic.

Avadavat. See WEAVER-BIRDS.

Avalanches (Fr., from *aval*, 'to descend') are masses of snow or ice that slide or roll down the declivities of high mountains, and often occasion great devastation. They have various names, according to their nature. Drift or powder avalanches (Ger. *Staub-lawinen*) consist of snow, which, loose and dry from strong frost, once set in motion by the wind, accumulates in its descent, and comes suddenly into the valley in an overwhelming dust-cloud. Avalanches of this kind occur chiefly in winter, and are dangerous on account of their suddenness, suffocating men and animals, and overturning houses by the compression of the air which they cause. Another kind of avalanche resembles a landslide. When the snow begins to melt in spring, the soil beneath becomes loose and slippery; and the snow slides down the declivity by its own weight, carrying with it soil, trees, and rocks. The greatest danger is where elevated tracts of moderate declivity are separated from the valleys by precipitous walls of rock; the softened snow of spring beginning to roll or slide on these slopes, is hurled over the precipices with fearful force into the valleys. The very wind caused by them prostrates forests and houses. Ice avalanches are those that are seen and heard in summer thundering down the steep—e.g. of the Jungfrau. They consist of masses of ice that detach themselves from the glaciers in the upper regions. They are most common in July, August, and September. Nine great Alpine avalanches, which cost 447 lives, are on record between 1518 and 1879, the most destructive being one of 1827, which swept away half the village of Biel, in the Upper Valais, with 88 inhabitants. Sudden avalanches, larger or smaller, constitute one of the special dangers of Alpine climbing. See Coaz, *Die Lawnen der Schweizeralpen* (Bern, 1881); Hein, *Handbuch der Gletscherkunde* (1885).

Avalon (anc. *Aballo*), a town of the department of Yonne, France, 26 miles SE. of Auxerre, on a steep hill of red granite, nearly surrounded by the river Cousin. A very ancient town, it was often besieged and taken; its church dates from the 12th century. Pop. 5000.

Avalon, or **AVILION** (perhaps Welsh *Ynys ar Afallon*, 'island of apples'), the name of the earthly paradise of Celtic mythology, a green island far to the westward where the sun-god seems to sink to his rest. Thither came heroes like Arthur, and there they continued to live. Here were the mystic fountain, the apples (*avlan*) with their strange magical properties, and the mighty smith who forged 'Duré Entaille' for Arthur. The name was applied in the chivalrous poetry of the middle ages to the region where the fairy Morgana holds her court, and afterwards by rationalising historians to the 'Isle of Saints'—the peninsula (once an island) in the river Bue in Somersetshire on which stood the abbey of Glastonbury (q.v.), with its legends of Joseph of Arimathea and of King Arthur (sent to be healed of his wounds).

Avalon, a peninsula forming the eastern part of Newfoundland (q.v.), in which St John's, the capital, is situated.

Avanturine. See AVENTURINE.

Avars, a tribe of Tatar origin, who made their appearance a hundred years later than the Bulgarians, in the countries about the Don, the Caspian Sea, and the Volga. One part of them remained in the Caucasus, another part pressed

forward (about 555 A.D.) to the Danube, and settled in Dacia. Here they served in Justinian's army, and assisted the Lombards to overturn the kingdom of the Gepidæ; and, about the end of the 6th century, under the mighty Khan Bajan, they conquered Pannonia. Later, they mastered Dalmatia; made devastating incursions into Germany and Italy; and extended their dominion over the Slavs living on, and northwards from, the Danube, as well as over the Bulgarians as far as the Black Sea. These nations at last rose against them, and in 640 A.D. drove them out of Dalmatia. Confined to Pannonia, they were subdued by Charlemagne, and well-nigh extirpated by the Moravians, so that after 827 they disappear from history. They usually surrounded their settlements with fortifications of stakes driven into the ground, and earth, of which traces, under the name of Avarian Rings, are yet found in the countries formerly occupied by them. The results of recent criticism show that, in all probability, the Avars belonged to the same great Turanian stock as the Huns, and that their original residence was the land lying east of the Tobol, in Siberia.

Avatar (Sanskrit, *avatāra*) signifies primarily a descent, but is specially applied to the descent of a Hindu deity upon the earth in a manifest shape, either for beneficent or for retributive ends. It is thus almost synonymous in its signification with the Christian term 'incarnation.' The word is sometimes rhetorically employed in English literature as equivalent to manifestation or phase. The ten avatars of Vishnu (q.v.) are the most famous in Hindu mythology.

Avatcha, a bay on the east coast of Kamchatka, by far the best harbour of the whole peninsula, and containing within it the smaller bay on which stands the capital city of Petropavlovsk (q.v.). Avatcha Bay is one of the finest harbours in the world, and is surrounded by superb scenery. The name is also given to two volcanoes lying to the north—one (Govalaja Sopka) 8500 feet high; the other (Koryatskaya Sopka) 10,000 feet high.

Avebury, or **ABURY**, a small village of Wiltshire, 6½ miles W. of Marlborough. It is remarkable as the site of the largest megalithic structure in Britain, and as having in its neighbourhood several barrows and cromlechs of remote antiquity. A large outer circle, occupying a flat area of ground on the south of the Kennet, a diminutive tributary of the Thames, consists, or rather consisted, of a hundred large blocks of stone, placed on end in a circular form, around a level area 330 yards in diameter, bounded by a deep ditch and a high embankment. There are also remains of two smaller stone circles within the inclosure, one consisting of two concentric circles of 43 upright stones, with a menhir, or obelisk, 20 feet high, near the centre; the other, a similar double circle of 45 stones, to the north-west of the former, with a dolmen in the centre. The stones that remain of this ancient work are not of uniform size; they measure from 5 to 20 feet in height above the ground, and from 3 to 12 in breadth and thickness. The embankment, which is broken down in several places, had originally an entrance to the circle, from which issued the 'Kennet Avenue,' running 1430 yards south-eastward in a perfectly straight line, and 17 yards broad, with a range of blocks on either side similar to those of the circle itself. Of the surrounding antiquities, those which appear most closely connected with the circle are the double circle (155 × 138 feet) on Hakpen Hill, and a large barrow, or lofty conical mound called Silbury Hill, three-quarters of a mile to the south. It is situated nearly midway between the two

avenues, in the line of the ancient Roman road between London and Bath. Close to the base, it measures 676 yards in circumference; the sloping height is 249 feet; the perpendicular height, 130 feet; the diameter of the level area at the top, 104 feet; the space covered by the whole work, over 5 acres. Avebury was included in the Ancient Monuments Protection Act, 1882.

Very little was known of Avebury temple and the antiquities in its vicinity till the year 1740, when Dr Stukeley published his *Stonehenge and Abury, Two Temples restored to the British Druids*; though Aubrey had written an account of them in 1663, by command of Charles II., the manuscript of which still exists. None of the earlier topographers or antiquaries appear to have left any description of them. When Sir Richard Hoare, in collecting materials for his *Ancient Wiltshire*, examined them in 1812, 72 years after Stukeley, and 164 after the first survey by Aubrey, a great number of the stones had disappeared, and in many places it was difficult to trace out even the plan of the works. Mr Fergusson believed the Avebury circle and Silbury Hill to mark the graves of those who fell in the twelfth or last Arthurian battle, at Badon Hill (520 A.D.), whilst Lord Avebury assigned Avebury to the close of the Stone, or the commencement of the Bronze, Age. Mr St George Gray's excavations point to Neolithic times. See works cited under STONEHENGE.

Avebury, LORD. See LUBBOCK.

Aveiro, a town of Portugal, in the province of Beira, 40 miles S of Oporto by rail. It is situated on the Ria d'Aveiro, a salt lake or lagoon, joined to the sea by a canal; is a bishop's see; and has fisheries. Pop. 12,000.

Avellino (anc. *Abellinum*), chief town of an Italian province of the same name, at the foot of Monte Vergine, 59 miles E. of Naples by rail. The monastery has a miracle-working image of the Virgin. Avellino suffered greatly from earthquakes in 1694, 1731, and 1805. It has a cathedral and college, manufactures of linen, paper, and hats, and a trade in corn and in hazel-nuts. Population, 24,000; of province, 400,000.

Avé Maria, also ANGELICA SALUTATIO or the Angelic Salutation, are names given by the Roman Catholics to a very common form of address to the Virgin Mary. *Ave Maria* are the first two words of the prayer, in Latin, which is taken from the angel Gabriel's salutation (Luke i. 28): 'Hail, Mary, highly favoured, the Lord is with thee; blessed art thou among women.' In this form, according to an ordinance of Gregory I., with the addition of Elizabeth's words, 'and blessed is the fruit of thy womb,' the invocation was at first said by the priests during mass, on the fourth Sunday after Advent. With the extended cult of the Virgin since the 11th century, the Ave Maria appears as a lay-prayer of equal use with the Pater Noster, and was sanctioned as such at the end of the 12th century. Accordingly, not only did Urban IV. (1261) add the concluding words, *Jesus Christus, Amen*, but since the first half of the 16th century, the prayer began to receive, more and more commonly, as an addition to the old formula, what constitutes the conclusion of the modern form: 'Holy Mary, mother of God, pray for us sinners, now and at the hour of our death, Amen.' The complete form in Latin is: 'Ave Maria, gratia plena, Dominus tecum, benedicta tu in mulieribus; et benedictus fructus ventris tui, Jesus. Sancta Maria, Mater Dei, ora pro nobis peccatoribus nunc et in hora mortis nostræ, Amen.' An edict of John XXII. (1326) ordains that every Catholic shall, morning, noon, and evening, at the warning of the bells, repeat three

aves. This ringing of bells as a summons to morning, mid-day, and evening prayer, is retained in some countries, and is still called the Ave Maria, or Angelus Domini. The whole prayer as it now stands is ordered in the breviary of Pius V. (1568) to be said daily before the Canonical Hours (q.v.), as well as after Compline. The aves are reckoned by the small beads of the rosary, which are hence called Ave Marias, while the large beads are devoted to the Pater Noster. The name *Angelus Domini* comes from the Latin version of the passage in Scripture introducing the salutation. There are famous musical settings of the Ave Maria by many of the great composers.

Avempace (*Ibn Badja*), Arabian philosopher, was born in Spain towards the close of the 11th century, most likely at Saragossa, lived as a physician in Morocco at the court of the Almoravides, and died at Fez in 1138. His principal work, known to us only through a Jewish writer of the 14th century, was the *Conduct of the Solitary*, a system of rules whereby mankind might rise to higher things.

Avens, the popular name of Geum (q.v.), a genus of Rosaceæ, of which two species, *G. urbanum*, the Common Avens, and *G. rivale*, or Water Avens, with their hybrids, are common in Britain, and range through temperate regions. The roots were formerly used in pharmacy as a tonic, astringent, and aromatic, whence the names of clove-root and herb-bennet (*herba benedicta*) of old herbals.

Aventine Hill. See ROME.

Aventinus [JOHANNES THURMAYR], a scholar and historian, born at Abensberg (Lat. *Aventinum*), Bavaria, in 1477, studied at Ingolstadt, Vienna, and Paris, and afterwards taught Greek and mathematics at Cracow. In 1509 the Duke of Bavaria called him to Munich, and intrusted him with the education of his sons. Here Aventinus wrote his history of Bavaria (*Annales Boiorum*). This work was not published until twenty years after his death, which took place at Ratisbon in 1534, and then only with large portions, more true than pleasant, about the Romish Church, excised. These, however, were all restored in Cisner's edition of 1580. Aventinus wrote several other learned works on history and antiquities. A complete edition of his works was issued by the Bavarian Academy of Sciences (Munich, 5 vols. 1880-84). His monument was erected in his native town in 1861. See Dollinger's *Studies in European History* (Eng. trans. 1890).

Aventurine, or AVANTURINE, a vitreous variety of quartz, generally translucent, and of a gray, green, yellow, red, or brown colour, and containing numerous minute spangles. These last are generally mica, but sometimes, according to some authorities, they are scales of metallic copper. It is used in jewelry, but is not so much valued as the finer kinds of amethyst or cairngorm stone. It is found in Silesia, Bohemia, France, Spain, and India, but chiefly in the Ural Mountains, near Ekaterinburg. Beautiful imitations of aventurine are made. The name for the natural substance in fact is borrowed from that applied to the artificial gold-spangled glass which originated accidentally—all *avventura* (*par aventure*)—at Murano, near Venice.

Avenzoar (properly *Ibn Zohr*), ABU MERWAN, an Arabian physician, born in Spain about 1072, died in 1162. He was the teacher of Averrhoes (q.v.), who speaks highly of his wisdom. One of his works was translated into Hebrew in 1280, and from thence into Latin, and was published, under the title *Rectificatio Medicationis et Regiminis*, at Venice, in 1490. It has since passed through numerous editions (as at Lyons, 1851).

Average. If any number of unequal quantities are given, another quantity may be found of a mean or intermediate magnitude, some of the given quantities being greater, and others less, than the one found, which is called the average. The exact relation is this: that the sum of the excesses of the greater above the average is equal to the sum of the defects of the less below it. If there are seven vessels unequally filled with sand, and containing, say, 5, 10, 12, 8, 11, 14, 3 ounces, the average is found by adding the numbers together, and dividing the sum 63 by 7, which gives 9 ounces as the average. Reflection, however, requires to be exercised in striking averages. If a farmer has three lots of cattle, the first of which he averages at £25 a head, the second at £15, and the third at £9, it might be thought that the average of the whole stock made up of the three lots would be got by taking the mean of £25, £15, and £9—viz. $25 + 15 + 9 \div 3 = £16\frac{2}{3}$. But this would be correct only if there were an equal number of cattle in each of the lots. To get the real average in case of the lots being unequal, he must multiply the average of each lot by the number of cattle in it, add the three products together, and divide by the whole number of cattle in all three lots taken together. If we suppose 9 head in the first lot, 20 in the second, and 15 in the third, the average is $(25 \times 9) + (15 \times 20) + (9 \times 15) = 660 \div (9 + 20 + 15) = £15$.

General Average is a contribution made by the various interests associated in a maritime adventure to restore the value of any sacrifice or extraordinary expense voluntarily incurred for the general safety. This equitable rule is to be found in the Rhodian law (see RHODES) and in the Rolls of Oléron (q.v.), and has been adopted with certain modifications by all maritime nations. The requisites to this contribution are that the sacrifice of part of the cargo, ship, or rigging has been advisedly made to procure the safety of what remains. The loss must not be caused by fault of the master or improper stowage; thus the throwing overboard or jettison (see FLOTSAM) of deck cargo will not give rise to average unless the stowing on deck is customary or agreed to by the contributing parties. The value of the cargo thrown overboard is computed at the market price at the port of delivery, less freight and charges saved. Among other losses covered by general average are those arising from the discharge of cargo to lighten the ship, from damage to ship or cargo in order to extinguish fire, or from cutting away masts or slipping anchors and cables to save the ship. The expenses incurred in floating a stranded ship or entering a port of refuge are also included, but no loss or expense falling under the shipowner's contract to keep his ship fit for service will be so included.

The contributing parties are the owners of the ship, the cargo, and the freight, or in modern times the insurers of these, and they are assessed in proportion to their value. The owners of the cargo pay on the net market value at the port of destination, or where the voyage is broken up, and the goods jettisoned contribute as well as those saved, as otherwise the owner of the lost goods would be placed in a better position than the others. Seamen's wages, and the personal effects of crew and passengers, are exempt from contribution.

If the ship reaches her destination, the average must be adjusted at that port, and in accordance with the law of the place; but if the voyage is broken up, the port of loading is taken. The adjustment of averages is often a very complicated task, and is usually undertaken by persons specially engaged in that business, called average adjusters.

Much inconvenience has arisen from the want of a uniform system of general average in different

countries, and an effort to establish such a system was made by an international congress which met in Glasgow in 1860. At a subsequent meeting at York in 1864 a code of rules was drawn up, but no practical result followed. At Antwerp in 1877 the York rules were revised; and the York-Antwerp rules, again revised at Liverpool in 1890, became generally recognised by means of a clause inserted in bills of lading and insurance policies. The International Law Association expended much labour upon the problem of average, and drew up an elaborate draft code in 1914.

Particular Average is the partial loss of ship or cargo, or damage thereto from accidental causes. In this case the common safety is not in question, and there is consequently no contribution, the loss remaining where it falls. To such cases the term average does not seem properly to apply, but the name has become applicable to all claims for loss at sea when not total, and its use in this case may possibly be explained by the consideration that such losses under marine policies are usually made good by *contribution* from various underwriters or joint-insurers.

An **Average Bond** is sometimes entered into by the contributories in order to fix an arbiter to adjust the average.

See Hopkins's *Handbook of Average*, Duckworth's *General and Particular Average* (1905), Arnold's *Marine Insurance* (8th ed. 1909); also **INSURANCE**.

The etymology of the word has caused much discussion. It first appears about the year 1500 in connection with the maritime trade in the Mediterranean; hence the corresponding Fr. *avarie*, Span. *avería*, Port. and It. *avaria*, as well as in the borrowed Ger. *havarie*, and Dutch *avarij*. The Italian form is most probably the original, from *avere*, 'goods'; Lat. *habere*, 'to have.' The It. *avere* is thus our old Eng. *aver*, 'property,' often specially in cattle, therefore 'cattle,' 'horses.' The reader of Burns will remember the word *avver*, 'an old horse.'

Avernus (Gr. *Aornos*, 'birdless'), called now Lago d'Averno, is a small, nearly circular lake in Campania, Italy, situated between Cumæ, Puteoli, and Baiæ. It is about a mile and a half in circumference, and occupies the crater of an extinct volcano. It is in some places as deep as 200 feet, and is almost completely shut in by steep and wooded heights. The sulphureous and mephitic vapours arising from the lake were believed in ancient times to kill the birds that flew over it; hence, according to some, its Greek appellation. Owing to its gloomy and awful aspect, it became the centre of almost all the fables of the ancients respecting the world of shades. Here was located Homer's entrance to the under world; here the Cimmerians are said to have dwelt in deep caverns, without ever coming into the light of day; here also were placed the Elysian fields, the grove of Hecate, and the grotto of the Cumæan Sibyl. Agrippa caused the dense woods to be thinned, by which the place lost much of its wildness; and by a cutting connected it with the Lucrine Lake and the sea, so as to make it a kind of harbour, but the volcanic upheaval of the Monte Nuovo in 1538 altered the region, and made Avernus again an inland lake. On its east side are ruins of a temple of Apollo, on its south side what is shown as the famous grotto of the Sibyl.

Averrho'a. See CARAMBOLA.

Averrho'es, or AVERRHÖES (properly *Ibn Roshd*), the most famous of the Arabian philosophers, was born at Córdoba, in Spain, in 1126. His father, who was judge there, instructed him in Mohammedan jurisprudence. In theology and philosophy, he had Ibn Tophail for his teacher;

and in medicine, Ibn Zohr, the elder. His talents and acquirements made him be appointed successor to his father, and afterwards judge in Morocco. For a while he was the khalif's physician. Being accused of a departure from the orthodox doctrines of Mohammedanism, he was dismissed from his office, and condemned to recant his heretical opinions, and do penance. After this, he returned to his native place, and lived in great poverty, until the khalif reinstated him in his offices, on which he went back to Morocco, where he died in 1198. Averrhoes regarded Aristotle as the greatest of all philosophers, and though he was ignorant both of Greek and of Syriac, illustrated his writings with great penetration; but the influence of the Alexandrian or Neoplatonic views is seen in his works, as in those of most of the Arabian philosophers. Thus he teaches the doctrine of a Universal Reason (other than the individual reasons), indivisible, but shared in by all; and denied the immortality of individual men. He expounded the Koran according to Aristotle, and so founded a Moslem philosophy of religion, the cause of many heresies. In opposition to the Arabian orthodox school, especially against Algazali, Averrhoes stood forth on the side of reason as the defender of philosophy. The Arabians called him, by way of eminence, the Expositor (of Aristotle). Most of his writings are known to us only through Latin translations (Ven. 1489). The Arabic text of the philosophical works was published in 1859 by M. J. Muller, followed by a German translation in 1875. Averrhoes also wrote a sort of medical system, which, under the name of *Colliget*, was translated into Latin, and repeatedly printed. The philosophy of Averrhoes attained to importance in the Christian Church as early as the 13th century, although his pantheistic doctrine of the unity of the active principle in the universe was often repudiated as an error, and astrology was characterised as Averrhoism. See Renan's *Averroes et l'Averroisme* (3d ed. 1882).

Aversa, a town of Southern Italy, in the province of Caserta, 12½ miles by rail N. of Naples, in a beautiful district rich in oranges and wine. It is well built, and has a cathedral and a number of monasteries, in one of which Andrew of Hungary, the Darnley of Neapolitan history, was murdered with the connivance of his wife, the beautiful but guilty Joanna, queen of Naples; it has also an excellent asylum for the insane, established by Murat, and a founding hospital. Aversa was built in 1029 by the Normans. About two miles from Aversa are a few ruins of Atella, famous as the birthplace of the satirical farces so popular on the Roman stage (see ATELLANÆ). Pop. 25,000.

Aves. See BIRD.

Avesnes, a fortified town in the French department of Nord, 13 miles E. by rail of Cambrai, and 8 miles from the Belgian frontier, with a pop. of 5000, who make cloth, soap, and beer.

Avesta. See ZEND-AVESTA.

Aveyron, a department in the south of France, named from the river which runs westwards through it, and after a course of 90 miles falls into the Tarn, a feeder of the Garonne. The department of Aveyron has an area of 3376 sq. m., in one of the most mountainous parts of France. Situated between the highlands of Auvergne and the Cevennes, it slopes like a terrace south-west to the Garonne. A third part of the land is unfit for cultivation, but affords excellent pasture for the numerous herds of cattle, goats, sheep, and swine, which form the principal resources of the mountaineers. The famous Roquefort cheese is exported hence in large quantities. Coal, iron, lead, zinc, copper, silver, alum, and antimony are found and

wrought; and paper, cotton and woollen cloths, and leather are produced. The capital is Rodez. There are many prehistoric remains in the department, which formed part of Guienne. Pop. 333,000

Avezza'no, a town of South Italy, in the province of Aquila, 22 miles S. from Aquila, with old walls and other antiquities. Of 11,000 inhabitants, few survived the earthquake of 13th January 1915.

Avia'nus, FLAVIUS, a Latin author who lived probably in the 3d or 4th century of our era, and of whose writings forty-two Æsopic fables in poor elegiac verse are extant. They were translated and published by Caxton. There are editions by Lachmann (1845) and Robinson Ellis (1887). See FABLE, BEAST-FABLES; also Hervieux, *Avianus et ses Anciens Imitateurs* (1893).

Aviary, a place for keeping birds; of which the arrangements must depend upon the habits of its inmates, the climate suited to them, and other circumstances. A large room may be fitted up as an aviary, with complete arrangements for heating and ventilation, and with perches resembling trees and branches, patches of sand or gravel, secluded places for nesting, and a trough of clear water; or in the open air a large space may be included within network, with actual trees and grass, and running water. In such spacious aviaries birds may be expected to thrive and breed better than in a bird-cage, which is a small aviary.

Aviation. See BALLOONS AND AEROPLANES.

Avicbron, long deemed, like Avempace, an Arabian philosopher, till Munk identified him in 1857 with Salomo ben Jehuda ibn Gabirol, a Jewish poet and philosopher. Born about 1020 at Cordova or Malaga, the latter in 1045 was expelled from Saragossa, and, after an unhappy, wandering life, died about 1070 at Valencia. His great work, *Mekor Chajim*, was written in Arabic; but through a Latin translation, *Fons Vitæ*, became known to the 13th-century Schoolmen. Its speculations are largely based on those of the Neoplatonists, especially Plotinus. See monographs by Geiger (1867), Stössel (1881), and Wittmann (1900-5); and the introductory essay to Wise's text and translation of *The Improvement of the Moral Qualities* (1902).

Avicenna (Arabic *Ibn Sina*), a famous Arab philosopher and physician, was born 980, near Bokhara, his father being a Persian tax-collector. He studied with singular zeal and success the Koran, mathematics, astronomy, the philosophy of Aristotle, and medicine. He was physician to several of the Samanide and Dilemite sultans, and also for some time vizier in Hamadan, where, after some years of retirement at Ispahan, he died in 1037. His works are based on those of the Greeks, whom he knew only through Arabic translations. His medical system, the *Canon*, long remained the standard of teaching and practice. His philosophy was Aristotelianism modified by Neoplatonic elements. Of his numerous writings, the chief, both medical and philosophical, were translated into Latin as early as 1493, and often reprinted. See Carra de Vaux, *Avicenne* (Par. 1900).

Avicennia, or WHITE MANGROVE, a genus of Verbenacæ (q.v.), consists of trees or large shrubs resembling mangroves (see MANGROVE), and like them, growing in tidal estuaries and salt-marshes. Their creeping roots, often standing six feet above the mud in crowded pyramidal masses, and the naked asparagus-like suckers which they throw up, have a singular appearance. The bark of *A. tomentosa*, the White Mangrove of Brazil, is used for tanning. *A. resinifera*, named in error, is now called *A. officinalis*; the gum used by Maoris for chewing was probably Kauri, and not anything derived from an Avicennia.

Avic'ula. See PEARL OYSTER.

Avie'nus, RUFUS FESTUS, a Latin descriptive poet of some merit, who flourished about the end of the 4th century. His works are *Descriptio Orbis Terræ*, in 1394 hexameters; *Ora Maritima*, in 703 iambic trimeters, describing the Mediterranean shore from Marseilles to Cadiz; *Aratea Phenomena*, in 1325, and *Aratea Prognostica*, in 552 hexameters, a paraphrase of the two well-known works of Aratus. See Holder's edition (Innsbruck, 1887).

Avi-fauna (Lat. *avis*, 'bird,' and *fauna*), a collective term for the birds found in any country: the fauna or zoology of that region as regards the birds. See FAUNA, GEOGRAPHICAL DISTRIBUTION.

Avigliano, a town of South Italy, in the province of Potenza, situated on a hill-ridge, 10 miles NW. of Potenza. Its inhabitants rear cattle, and are noted for their peculiar costume. Pop. 20,000.

Avignon (*Avenio*), a city of Provence, capital of the French department of Vaucluse, is situated on the left bank of the Rhône, 75 miles NW. of Marseilles. With narrow, crooked streets, 'windy Avignon' still is encircled by lofty crenellated walls (1349-68), except on the north side, where the Rocher des Doms rises steeply from the Rhône to a height of 200 feet. Here is the cathedral of Notre Dame, dating from the 11th century, with its papal throne, and monuments of two popes; whilst hard by towers the vast palace of the popes (1339-64). The multitude of churches and convents made Rabelais call Avignon *la ville sonnante*, 'the city of bells'; and churches there still are in plenty, though that of the Cordeliers, with the tomb of Petrarch's Laura, was demolished in 1791. Near the hôtel-de-ville (1862) are the quaint old Jacquemart belfry and a statue of Crillon, Henry IV.'s brave captain; Petrarch's statue (1874) may also be noticed. The city is the seat of an archbishop, has a museum and picture-gallery, and several other valuable institutions. The university, founded in 1303, was abolished in 1794. Avignon has manufactures of paper, leather, silk, iron, &c., and is famous for its garden produce, its fruit, wine, honey, &c. The country about Avignon is delightful, and extremely fruitful in corn, wine, olives, oranges, and lemons. The population is about 48,000. In Avignon, Petrarch spent several years; here, in the church of St Clara, he first saw Laura. Vaucluse, which he has immortalised, lies 18 miles from Avignon. Avignon was the capital of the ancient *Cavares*, and presents many remains of the times of the Romans. In the middle ages, it formed, with the surrounding district, a county, which the popes, who had already received the county of Venaissin as a gift from King Philip III., bought in 1348 from Joanna, queen of Naples and Countess of Provence. The pope governed both counties through a vice-legat, and continued in the possession of them till 1790, when, after several stormy and bloody scenes, the city with its district was united with France. At the peace of Tolentino (1797), the pope formally resigned Avignon and Venaissin. Avignon is celebrated in ecclesiastical history as being for a time the residence of the popes. By order of Philip IV. of France, Pope Clement V. and six of his successors from 1309 to 1377, were obliged to reside there. It was afterwards (1378-1418) the residence of the French anti-popes. Two ecclesiastical councils were also held at Avignon (1326-37). A little cottage here was long the loved retreat of John Stuart Mill, and there he died in 1873. See *The Story of Avignon*, by Thomas Okey (1912).

Ávila, a town of Spain, capital of the province of Ávila, in Old Castile, situated at a height

of 3000 feet above the sea, at the base of the Sierra de Guadarrama, 71 miles NW. of Madrid by rail. Ávila has a fine Gothic cathedral and a Moorish castle, and its massive granite walls still stand, 42 feet high and 14 broad, with 86 towers and 10 gateways. Its university, founded in 1482, was reduced to a college in 1807. Population, 12,000, engaged in manufacturing cloth. Here St Teresa was born.—The province is mountainous, but has fertile valleys. Its mineral wealth is still undeveloped; the chief produce is merino wool. Area, 3000 sq. m.; pop. 200,000.

Ávila, GIL GONZALEZ DE, born at Ávila in 1577, was a royal historiographer for Castile, wrote histories of several Castilian kings, and died in 1658.

Ávila y Zuñica, DON LUIZ DE, a Spanish general, diplomatist, and historian, born about 1490, enjoyed the favour and confidence of Charles V., who intrusted him with embassies to the popes Paul IV. and Pius IV. He accompanied the emperor on his expedition against the German Protestant princes, and wrote an account of the war, *Comentarios* (1547).

Avilés (anc. *Flavignavia*), a seaport of Spain, close to the Bay of Biscay, 19 miles N. of Oviedo. There are coal and copper mines in the vicinity. Manufactures of earthenware, glass, linen, &c. are also carried on. Pop. 14,000.

Avilion. See AVALON.

Avi'so (Span. *aviso*, 'advice,' 'intelligence'), a despatch-boat, a small swift vessel belonging to the navy; also used of a kind of torpedo-boat.

Avison, CHARLES, a musical composer, was born at Newcastle about 1710, and after studying in Italy, became organist at Newcastle, where he died in 1770. He wrote an *Essay on Musical Expression* (1752), in which he ranked the French and Italian composers above the Germans; and he composed sets of concertos and sonatas which were very popular for a time. He figures in Browning's *Parleyings with Certain People*.

Avizandum (late Lat. *avizare*, 'to consider,' 'to advise') formerly meant the report of a cause made by a Lord Ordinary to the Inner House of the Court of Session, when all causes were decided by the Inner House, and merely sent to the Ordinary for procedure. This practice survives only in the case of five different kinds of action. The word is also applied to the consideration which the Lord Ordinary now gives to a cause before pronouncing judgment. It is also used when a sheriff or other judge takes a case for private consideration outside the Court, and delays judgment.

Avlona (Ital. *Valona*, anc. *Aulon*), the best seaport in Albania, stands on an eminence near the Gulf of Avlona, an inlet of the Adriatic, at whose mouth is the island of Sasseno, the ancient Saso, with Italian garrison (till 1914 Greek). It carries on considerable trade with Brindisi, &c. Pop. about 6000. The Christian inhabitants, chiefly Italians, are engaged in commerce, exporting oil, wool, salt, pitch, and especially tortoise-shell. The Mohammedans manufacture weapons and woollen fabrics. *Valona*, exported for tanning, is the pericarp of an acorn grown in the neighbourhood. Up to 1691 the town belonged to Venice, up to 1912-13 to Turkey. In the anarchy of the Great War it was occupied by Italy; evacuated 1920.

Avoca, or OVOCA (Celt. 'meeting of the waters'), a small river in the SE. of County Wicklow, formed by the union of the Avonmore and Avonbeg, which rise in the hills of the centre of the county. The Avoca runs through a very picturesque vale only a quarter of a mile broad, with wooded banks 300 to 500 feet high, and after

a course of 9 miles reaches the sea at Arklow. A railway now extends through the vale, and connects a mining district with Wicklow and Dublin. The 'sweet vale' is celebrated in one of Moore's *Irish Melodies*. At Avondale, on the Avonmore, Charles Stewart Parnell was born.

Avoca'do Pear, or ALLIGATOR PEAR (*Persea gratissima*), a fruit-tree of the natural order Lauraceæ (q.v.), is a native of tropical America and the West Indies. The fruit is a drupe, but in size and shape resembles a huge pear; is usually of a brown colour, and has a soft or deep green pulp, not very sweet, but of a delicate flavour, which dissolves like butter on the tongue, and contains a large quantity of a fixed oil which is sometimes expressed for soapmaking and illuminating purposes. It is called *vegetable butter* in some of the French colonies. It is much esteemed in the West Indies, and often eaten with pepper and salt, or with sugar and lime-juice or spices. The seeds give a black stain, used for marking linen.

Avocet (*Recurvirostra*), a genus of birds, which, although having the feet webbed nearly to the end of the toes, is usually ranked among the Grallæ or Grallatores, on account of the length of the legs, the half-naked thighs, the long, slender, elastic bill, and the general snipe-like habit. They are distinguished from all other birds, except a few species of humming-bird, by the strong upward curvature of the long slender bill, which is much like a thin piece of elastic

The Common Avocet (*Recurvirostra avocetta*).

whalebone, and adapted as a tactile organ for seeking food in the mud, as their webbed feet are for walking upon it, and their long legs for wading in the fens and marshes which they frequent. The wings are long and pointed; the tail short and rounded. They can move quickly along the ground, and fly swiftly and low. Swimming is only resorted to by accident or compulsion. They scoop through the mud with the bill, first to one side, and then to the other, in quest of worms and other small animals; although Audubon also observed the American Avocet taking insects which were swimming on the surface of the water, and expertly catching them in the air, running after them with partially expanded wings. The Avocets are found in most parts of the globe.—The Common Avocet (*R. avocetta*), about the size of a lapwing, is sometimes, though very rarely, found in the fenny districts of England; it is a native of the continents of Europe, Asia, and Africa, occurring even at the Cape of Good Hope.—Other species are natives of North America, India, and New Holland.—The American Avocet (*R. americana*) has the bill less recurved than the Common Avocet.

Avoga'dro di Quaregna, COUNT AMEDEO, physicist, was born in Turin, 9th August 1776. He studied law, and became secretary to a provincial prefecture. In 1809-21 he was professor of physics and mathematics at the Lyceum of Vercelli, in 1821-23 and 1833-50 of higher physics at Turin. He died 9th July 1856. He wrote many memoirs on a variety of physical subjects, but is chiefly famous for 'Avogadro's Law,' enunciated in 1811. See ATOMIC THEORY, and a short Life by Alfonso Cossa.

Avoidance, in ecclesiastical law, signifies the vacancy of a benefice, or the fact of its being *void* of an incumbent. See BENEFICE, CONFESSION.

Avoirdupois, or AVERDEPOIS, is the name given to the system of weights applied normally in Great Britain and Ireland to all goods except the precious metals and precious stones and medicines. The word is derived from the Old French *avoir de pois* ('goods of weight'), the word *avoir* or *avoir* being a noun meaning 'property,' 'goods.' The form *avordupois* was in use in the 17th century.

The grain is the foundation of the avoirdupois system, as well as of the troy. A cubic inch of water, at standard temperature, weighs 252.458 grains. Of the grains so determined, 7000 make a pound avoirdupois, and 5760 a pound troy (see WEIGHTS AND MEASURES).

TABLE OF AVOIRDUPOIS WEIGHT.

27½ grains	are 1 dram	1 dr
16 drams or diachms	" 1 ounce	1 oz.
16 ounces	" 1 pound	1 lb.
28 pounds	" 1 quarter	1 qr
4 quarters	" 1 hundredweight	1 cwt
20 hundredweight	" 1 ton	1 ton.

A cubic foot of water weighs 997.14 ounces avoirdupois, which gives an easy rule for determining the weight of a cubic foot of any substance from its specific gravity. Avoirdupois is the weight used in the United States of North America, where, however, a cwt., or *cental*, of only 100 lb. has come into general use, and a ton of 2000 lb.

Avola (*Abolla*), a seaport town on the east coast of Sicily, 13 miles SW. of Syracuse. It was destroyed by earthquake in 1693, but afterwards rebuilt. The famous honey of Hybla comes from this neighbourhood. There is tunny-fishing, a sugar-refinery, and some trade in agricultural produce. Pop. 16,000.

Avon, a word of Celtic origin, meaning 'river,' which is the name of several of the smaller British rivers. Of these may be noticed—(1) The Upper or Warwickshire Avon, which rises at Naseby in Northamptonshire, runs south-west through Warwickshire and Worcestershire, passing Rugby, Warwick, Stratford, and Evesham, and joining the Severn at Tewkesbury. It has a course of 96 miles, and receives several tributaries, including the Swift from Lutterworth. Its pretty peaceful course, whose waves rolled Wyclif's ashes towards the sea, and saw the first flights of the 'sweet Swan of Avon,' is finely depicted in twenty-one etchings by Mr Heywood Sumner (Lond. 1881).—(2) The Lower, or Bristol Avon, which rises in North-west Wiltshire, and runs about 70 miles, first south in Wiltshire, and then west and north-west between Gloucestershire and Somersetshire. It traverses an oolitic basin, passing Bradford, Bath, and Bristol, and empties itself into the Bristol Channel. It is navigable for large vessels up to Bristol. It runs generally between deep banks in a rich valley. A canal through the middle of Wiltshire connects it with the Thames.—(3) The Wiltshire and Hampshire, or East Avon, which rises in the middle of Wiltshire, and runs south 70 miles through Wiltshire and Hampshire, passing Amesbury, Salisbury, and Ringwood, and

entering the English Channel at Christchurch. It is navigable up to Salisbury. It abounds in the small delicate loach. In Wales, two rivers named Avon—one rising in Monmouthshire, the other in Glamorganshire—fall into Swansea Bay. In Scotland there are several of the same name, affluents of the Spey, Clyde, and Forth.

Avonmouth, in Gloucestershire, is at the mouth of the Avon, 6 miles NW. of Bristol. The docks, constructed for a railway company in 1880-84, were, like the Portishead docks on the other side of the Avon, acquired by the city of Bristol, and now rank as within the port of Bristol (q.v.); the larger Royal Edward dock was opened in 1908.

Avranches (anc. *Abrincate*), a French town in the department of Manche, near the mouth of the Sée, 37 miles E. of St Malo by rail. Till 1801 a bishop's seat, its former cathedral was built in the 18th century on the site of a cathedral consecrated in 1121, in which Henry II. received absolution for Becket's murder. Avranches has manufactures of lace, candles, and salt, and some trade in cider, grain, butter, cattle, &c. Pop. 7000.

Awadh. See OUDH.

Award. See ARBITRATION.

Awe, LOCH, an Argyllshire lake, 22 miles E. of Oban. Lying 118 feet above sea-level, it extends 2½ miles north-eastward, varies in breadth between 3 furlongs and ¾ miles, covers 15 sq. m., and has a maximum depth of 307 feet. The country around consists of mica-slate. The scenery is most striking at the north-east end—originally the head—of the lake, where the water is studded with numerous wooded islets, overshadowed by towering and rugged mountains, prominent among which rises the dark and rocky ridge of Ben Cruachan, 3689 feet high, and 14 miles in circuit. Of the islets, the most noted are Fraoch-Eilean, containing the remains of a castle granted to Gilbert Macnaughton in 1267 by Alexander III.; and Inishail, with its ancient burying-ground, where in 1857 P. G. Hamerton fixed his 'painter's camp.' On a rocky peninsula, in the north end of the lake, stands Kilchurn Castle, once a fortress of great strength, built about 1440 by Sir Colin Campbell of Glenorchy. The waters of the lake are carried off at its north-west end by the brawling river Awe, which, after a course of 5 miles, enters Loch Etive at Bunawe. The magnificent 'Pass of Brander,' through which the road and railway run beneath the shoulder of Ben Cruachan, was the scene of a conflict in 1308 between Robert the Bruce and the Macdougals of Lorn. The loch has fine trout, *Salmo ferax*, and salmon. Inverliver estate was bought by government for forestry demonstrations.

Aweto (also called Hotete, Anuhe, Weri), a New Zealand grub or caterpillar, eaten with joy by the Maoris. Out of the nape of its neck there grows a fungus (*Sphaeria*), seven or eight inches long, curving at the end, which for a length of three inches is covered with brown 'seed.'

Awn (*Arista*), in the flowers of Grasses (q.v.), a solitary pointed bristle, growing either from a glume or a palea. The flowers of some grasses are entirely awnless; in many, the glumes alone are awned, or only one of them; in others, the glumes are awnless, and the paleæ, or one palea, awned. The awn often appears as a terminal prolongation of the midrib of glume or palea; or it may separate below the point, and is then said to be dorsal; or may be jointed at the base, and free from the joint onwards. It may be straight or bent like a knee, or even twisted, and liable to change when moist. Sometimes it is rough, or even serrate, at the edges, as in barley; and sometimes feathery, as in feather-grass (*Stipa*),

where it is also remarkable for its great length. The characters of genera and species are often derived from the awn, but it is not always invariable, even in the same species, and the cultivated varieties of wheat and oats differ much in being more or less bearded. There appears to be a tendency to the diminution or disappearance of the awn through cultivation. See GRASSES.

Ax, or ACGS, in the French department of Ariège, lies at the foot of the Pyrenees, at the junction of three picturesque valleys, 74 miles SSE. of Toulouse. It is celebrated for its baths, and possesses the hottest sulphur-springs in the Pyrenees, to the number of 80, ranging in temperature from 77° to 172° F.

Axe, an instrument, usually of iron, edged with steel, for hewing timber and chopping wood. The haft or handle is of a length and size suitable for wielding with both hands, and is fitted into a head with an arching edge in the plane of the sweep of the tool—the axe differing in this last respect from the adze, which is found in use amongst some uncivilised peoples that do not use axes at all. Similar instruments of smaller size, for use with one hand, are called hatchets (Fr. *hachette*, diminutive of *hache*, 'an axe'). The usefulness of the implement made it one of the first tools suggested by the needs of man, and, accordingly, among the very earliest archaeological relics we find almost invariably some form of axe. The stone axes of our own country are the same as those still in use in many islands of the South Pacific, and the Tomahawk (q.v.) of America finds a close parallel in the 'francisca,' a hatchet for throwing, at one time the national weapon of the Franks. These, and the bronze axes of England and Mexico, with the rough iron instrument of northern nations, all witness the primitive use of this weapon. The prehistoric axe is distinguished from a 'celt' proper (see CELT), which was a chisel, by a more complex shape, and by being bored or otherwise fitted for a handle. Within historic times, the axe has recovered its early importance with the progress of colonisation, and its importance to settlers has led to the invention of the American axe, which effects speedier results with the smallest expenditure of strength. The head of this axe is

The American Axe.

about nine inches long, and the arched head is somewhat broader than the back, while its sides are also convex. The principal advantage of this formation is that, as only part of the edge strikes the wood, on this spot all the force of the blow is concentrated; moreover, the convexity of the sides prevents the blade being caught fast, and facilitates its withdrawal. The handle, which is generally made of hickory or some other elastic wood, is rendered stronger and more elastic by its shape, resembling a half-strung bow. The manufacture of the axe includes more processes than might be supposed. After being cut to the requisite length, and the eye for the handle punched through it, it is pressed into shape between concave dies. With borax as a flux, the edge-piece of steel is now attached to a groove previously prepared, and several processes must follow, including welding, sharpening, tempering, polishing, and varnishing

with a mixture of turpentine and asphaltum, to prevent rust, before the finished instrument is ready for the market. A large quantity of these implements are manufactured in the United States. See also, BATTLE-AXE, HALBERT, LOCHABER AXE, TOMAHAWK. The so-called cuttal-axe was not an axe. See CUTLASS.

Axel, or ABSALON, from 1177 Archbishop of Lund, and also minister and general to Valdemar I. and Canute VI. of Denmark, was born in 1128, and died at Soro in 1201. He distinguished himself as well by wisdom and uprightness in peace, as by valour and address in war. The Wendish pirates were driven from the coasts of Denmark, and he defeated the Pomeranian prince, Bogislav. In the wise legislation of Valdemar and of his son, he had a great part. He favoured and promoted learning and art, and to his encouragement we owe the history of Denmark by Saxo Grammaticus. By building a castle, he laid the foundation of the future great city of Copenhagen, then an insignificant village.

Axestone, a variety of the mineral Jade or Nephrite (q.v.). It is of a greenish, grayish, or grayish-white colour, is more or less translucent, hard, tough, and not easily broken. It occurs in Silesia, in Central Asia and China, and in New Zealand and other islands of the Southern Pacific. It derives its name from the use to which it is put by the natives of these islands for making their axes and clubs. They also make ear-drops of it.

Axholme, ISLE OF, a low level tract of North-west Lincolnshire, cut off by the Trent from the rest of the county. Measuring 18 by 5 miles, it was anciently a forest, but afterwards became a marsh, which was drained into the Trent in 1625 and succeeding years by Cornelius Vermuyden, a Dutchman, at a cost of £56,000. The reclaimed land became very fertile under Dutch and French Protestant settlers, but, after much litigation, it was in 1691 divided, the original inhabitants receiving 10,332 acres, and the settlers only 2868. For the interesting story of the Isle of Axholme—the Mowbrays, its ancient lords; the wizard-hermit of Lindholme; and Epworth, the home of the Wesleys—see Peck's *Isle of Axholme* (1815), and books named at LINCOLNSHIRE, especially the 'Victoria History' of the county (1900-10).

Axil (*axilla*), in Botany, the angle between the upper side of a leaf and the stem or branch from which it grows. Buds usually grow out from the stem in the axils of leaves, and this position is naturally termed *axillary*.—(2) In anatomical terminology, the axilla is the armpit.

Axim, an important station and port on the Gold Coast (q.v.), a little to the E. of the mouth of the Ancobrah River. Inland from Axim, in the basin of that river, and in the district between it and the Prah, gold-mining has been largely carried on. The harbour is one of the best on the coast.

Axinomancy (Gr. *axinē*, 'an axe,' and *manteia*, 'divination'), a mode of divination much practised by the ancient Greeks, particularly with the view of discovering the perpetrators of great crimes. An axe was poised upon a stake, and was supposed to move so as to indicate the guilty person; or the names of suspected persons being pronounced, the motion of the axe at a particular name was accepted as a sign of guilt. Another method of axinomancy was by watching the movements of an agate placed upon a red-hot axe. This is only one of a multitude of analogous modes of divination practised in all ages and among all nations. See DIVINATION, and DIVINING-ROD.

Axiom, a Greek word meaning a 'decision' or 'assumption,' is commonly used to signify a general

proposition which the understanding recognises as true, as soon as the import of the words conveying it is apprehended. Such a proposition is therefore known directly, and does not need to be deduced from any other. Of this kind, for example, are all propositions whose predicate is a property essential to our notion of the subject. Every rational science requires such fundamental propositions, from which all the truths composing it are derived; the whole of geometry, for instance, rests on comparatively a very few axioms. Whether there is, for the whole of human knowledge, any single, absolutely first axiom, from which all else that is known may be deduced, is a question that has given rise to much disputation; but the fact that human knowledge may have various starting-points answers it in the negative. Mathematicians use the word axiom to denote those propositions which they must assume as known from some other source than deductive reasoning, and employ in proving all the other truths of the science. The rigour of method requires that no more be assumed than are absolutely necessary. Every self-evident proposition, therefore, is not an axiom in this sense, though, of course, it is desirable that every axiom be self-evident; thus, Euclid rests the whole of geometry on fifteen assumptions, but he proves propositions that are at least as self-evident as some that he takes for granted. That 'any two sides of a triangle are greater than the third,' is as self-evident as that 'all right angles are equal to one another,' and much more so than his assumption about parallels. Euclid's assumptions are divided into three 'postulates' or demands, and twelve 'common notions;' the term axiom is of later introduction. The distinction between axioms and postulates is usually stated in this way: an axiom is 'a theorem granted without demonstration;' a postulate is 'a problem granted without construction'—as, To draw a straight line between two given points.

Axis, a genus of deer, abundant on the banks of the Ganges, but found throughout India and in many islands of the Eastern Archipelago. It was known to the ancients by the name Axis. One of its Indian names is Chittra or Cheetal, and by British sportsmen in India it is often called the Spotted Hog-deer, though that name is also given to a rarer species. The axis has a great resemblance in size and colouring to the European fallow-deer; it is generally of a rich fawn colour, beautifully spotted with white, nearly black along the back, the under parts snow-white. The horns, however, differ very much from those of the fallow-deer, being slender, sharp-pointed, little branched, and not at all palmate. The female has no horns, and is lighter in colour than the male. The axis frequents thick jungles in the vicinity of water, and feeds during the night. Its spots facilitate concealment in the interrupted light of jungle life. It is commonly found in herds of 15 or 20, of which 3 or 4 are males. Its sense of smell is remarkably acute, and it is generally very shy and timid, so that sportsmen find it difficult to get within range. The males, however, sometimes exhibit great courage in defence of the young. It is gentle and very easily domesticated, has been frequently imported into Europe, and breeds freely, when kept in parks, in Britain and France.

Axis, in Geometry. The axis of a curved line in a plane is a right line dividing the curve into two symmetrical parts, so that the part on one side exactly corresponds with that on the other; as in the parabola, the ellipse, and the hyperbola. The axis of any geometrical solid is the right line which passes through the centre of all the corresponding parallel sections of it: in this sense, we speak of

the axis of a cylinder, a globe, or a spheroid. By the axis of rotation, we understand the right line around which a body revolves.—In physical science, the axis of a *lens* is the right line passing through it in such a manner as to be perpendicular to both sides of it; and the axis of a telescope is a right line which passes through the centres of all the glasses in the tube. The axis of the *eye* is the right line passing through the centres of the pupil and the crystalline lens.

Axis, in Botany, a term applied to the central portion of the higher plants (higher cryptogams as well as phanerogams), which bears the appendages or lateral members arranged upon it. Those plants in which no distinction of axis and appendages can be made out are termed *Thallophytes*, and include algæ, lichens, and fungi. The stem is called the *ascending axis*; the root, the *descending axis*. In the germinating seed, these are distinguished as plumule and radicle. The terminal part of an axis bearing the reproductive organs in flowering plants is called the *floral axis*. This is usually a very short portion, but may be elongated, broadened, hollowed, &c. The notion of a flowering plant as simply an axis with more or less modified appendages serving different purposes, as scale, leaf, petal, stamen, carpel, &c., is older than Linnæus, but was first clearly grasped by the embryologist Wolff, and even more systematically at a later date (1790) by the many-sided poet Goethe. In describing animal forms it is customary to define the disposition of the parts in reference to certain axes, lateral, dorso-ventral, radial, &c. (see MORPHOLOGY).—The term *axis* is specially applied in human anatomy to the second vertebra of the neck (see SPINAL COLUMN).

Axminster, a small old town of Devonshire, on the left bank of the Axe, 27 miles E. of Exeter by rail. The parish church, originally cruciform, retains a good Norman doorway. From 1755 till 1835 Axminster was famous for the manufacture of Turkey and Persian carpets (see CARPETS). Dr Buckland was a native. Pop. (urban district), 2000. See Pulman's *Book of the Axe* (1875).

Axolotl (the Aztec word), an amphibian form occurring abundantly in some Mexican lakes, and found widely distributed in the Western United States. It used to be ranked among the forms which permanently retain their gills (*Perenni-branchiata*), but more complete observation has shown that it develops into a gill-less adult form (*Amblystoma*) like a salamander. Both forms

A, Axolotl; B, Amblystoma.

were known, and regarded as different kinds of animals, for some time before Dumeril in 1865 observed the passage of the gilled axolotl into the gill-less *Amblystoma*. Marie von Chauvin and

others have confirmed the discovery. The fact is that the axolotl is a larval form, which may remain permanently a larva, and may even reproduce without putting on adult characters. This phenomenon of retaining juvenile characters is known in a number of amphibians, and is called neoteny. Some stimulus seems to be lacking, without which the development cannot be completed. It has been suggested that a diminution of the water-supply, an increase of temperature, and certain nutritive conditions bring on the metamorphosis, but the subject demands further investigation. Both forms may be collected from the same lake. The axolotl is plump and short-legged, from 8 to 10 inches in length, of a dark colour with spots, and with the common amphibian character of slightly changing its colour (see CHROMATOPHORES). It bears three feathery gills on each side of its neck. It is esteemed a delicacy in Mexico. See AMBLYSTOMA.

Axum, once capital of an Ethiopian kingdom, is now in the modern Abyssinian province of Tigré, and lies mainly in ruins. Pop. 2000. The former greatness of the city is testified by yet remaining structures cut in granite, of which the most notable are a church, broken columns, and a great obelisk. Some of the ruins bear inscriptions, from which it appears that the Axumite empire extended over Abyssinia, and even over Yemen and Saba in Arabia, and possessed the command of the Red Sea. This country was the farthest point southward that Greek civilisation reached. Under King Aizanes (4th century), Christianity was introduced into the country by the two apostles Frumentius and Aedesius (see FRUMENTIUS). The new doctrine soon spread over the whole country; Frumentius was made the first Bishop of Axum, and the Axumite form of the language became the ecclesiastical language of Abyssinia. The Axumite empire formed the outermost bulwark of Christianity; and, as such, in its interference in behalf of the Christians in Arabia, it became the natural antagonist of Mohammedanism. The contests in which it soon became involved with that power caused its fall.

Ayacucho, formerly Huamanga or Guamanga, a town in the Peruvian department of the same name, 220 miles ESE. of Lima. Founded by Pizarro in 1539, it is now a handsome and thriving town. Here, on the 9th December 1824, the combined forces of Peru and Colombia—the latter then comprising Ecuador, New Granada, and Venezuela—totally defeated the last Spanish army that ever set foot on the continent. Pop. 20,000.—The department of Ayacucho has an area of 18,000 sq. m., and a population of 302,000. It consists of elevated plains and deep valleys; agriculture and bee-keeping are the chief industries.

Ayala, PEDRO LOPEZ DE (*El Viejo*), was born at Murcia in 1332, of one of the first Castilian families. A brave soldier and able statesman, he filled some of the leading offices under several kings of Castile, and died in 1407. But Ayala's truest title to fame is his *Cronicas de los Reyes de Castilla* (best ed. 1780), which contains the history of Castile from the middle to the end of the 14th century. His *Rimado de Palacio*, begun during his captivity in England (1367), is a didactic and satirical poem of some value.—ADELARDO LOPEZ DE AYALA (1829-79) was likewise a statesman, and a dramatist and lyrical poet of high merit.

Ayamonté, a fortified town of Andalusia, Spain, on the left bank of the Guadiana, and near its mouth. Fishing, boat-building, and silk-weaving are carried on. Pop. 8300.

Ayasaluk, a village on the site of the ancient Ephesus (q.v.).

Aye-aye (*Cheiromys madagascariensis*), a rare and aberrant member of the Lemnir family (q.v.).

It inhabits the woods of Madagascar, and was first noted in 1780 by Sonnerat, who was said to have given it the name Aye-aye in reference to the astonished exclamation of some natives when they saw the first specimen of the curious creature

Aye-aye (from Owen).

caught by a European. But more probably the name is onomatopoeic, derived from the cry of the animal, *Hai-hay* (*Hî-hî*). It was for long a puzzle to zoologists; Buffon placed it beside squirrels, and Cuvier was also inclined to regard it as a rodent. It was carefully described by Owen in the *Transactions of the Zoological Society*, 1866, and since the publication of this beautiful and exhaustive memoir, there has been no doubt as to the position of the aye-aye as an aberrant lemur.

It is about the size of a cat, with thick, dark hair; long, bushy, flexible tail; large naked ears, quick to detect the faintest sound; big, well-protected eyes, suited for its exclusively nocturnal and arboreal

Head and Fore-feet of Aye-aye on larger scale.
(From Owen.)

labours; rodent-like front teeth, with which it gnaws the branches in search of boring insects; and above all, a peculiar, spidery, hairy hand, with an extremely slender, almost wire-like, third finger, which looks as if it were paralysed, but is used in detecting and picking out the favourite wood grubs. Other characters of the unique hand will be seen in the figure. Its zoological position may be stated as that of a divergent offshoot from a primitive and generalised lemur type with many rodent affinities. It sleeps all day, wrapped in its bushy tail, and often within a nest in a tree-cleft; it is

very active at night, creeping along the branches with plaintive grunts, holding firm by its hind-feet, and tapping and probing with its fingers every here and there when its quick ear detects the presence of grubs. It also feeds on fruits, bamboo-pith, sugar-cane juice, and the like, and uses its long fingers very dexterously for drinking purposes. The natives of Madagascar regard this curious animal with superstitious reverence; and its peculiar structure and habits make it one of the most interesting of mammals.

Ayenbite of Inwyrt ('Remorse of Conscience'), famous in Middle English literature, was a translation in 1340 by Dan Michel, a monk of St Augustine's, Canterbury, of *Le Somme des Vices et des Vertus*, written in 1279 for Philip III. of France by Frère Lorens.

Ayeshah (also *Aysha* or *Aïsha*), the favourite but childless wife of Mohammed, who accompanied him in his campaigns, was the daughter of Abu-Bekr, born at Medina about 610 A.D. When Mohammed had died in her arms (632), she successfully exercised her influence to prevent Ali, the Prophet's son-in-law, from becoming khalif, and secured the succession for her father, Abu-Bekr. Again on Othman's death she headed a force to resist the accession of Ali, but the troops under her were in 656 defeated by Ali, and she was taken prisoner. She died at Medina (677 A.D.), highly venerated by all true Mussulmans, and named the *Prophetess* and the *Mother of Believers*.

Aylesbury, the chief town of Buckinghamshire, in a fertile vale, on a rivulet flowing to the Tame, 43½ miles NW. of London. Among its buildings are the cruciform parish church, finely restored by Sir G. G. Scott (1849-67), the corn exchange and markets (1865), and the county infirmary (1862). The inhabitants make straw-plait, condensed milk, and dairy-produce, and rear ducks. There is a convict prison for women, with a Boistal Institute for girls. Aylesbury was taken from the Britons by the Saxons in 571. Till 1885 it formed with its hundred a parliamentary borough, with two members. Pop. 12,000.

Aylesford, a village of Kent, on the Medway, 3½ miles NW. of Maidstone. Its remarkable ancient remains include Kits Coty House (q.v.).

Aylmer, JOHN, born in 1521—the ancestral home was Aylmer Hall, Tilney St Lawrence, Norfolk—in 1541 graduated at Cambridge. He became tutor to Lady Jane Grey; in 1553 Archdeacon of Stow; in 1562, of Lincoln, having lived abroad during the Marian persecution; and, finally, in 1577 Bishop of London. Under the designation of 'Morrell,' he is described in Spenser's *Shepherd's Calendar* as the 'proude and ambitious pastoure'—a fair enough estimate of one who showed equal rigour to Catholics and Puritans, and was always quarrelsome and arbitrary. He died 3d June 1594.

Aymer de Valence, Earl of Pembroke, a half-nephew of Henry III., as English Guardian of Scotland, defeated Bruce at Methven (1306), but lost the battle of Loudon Hill (1307). He sided at first with, afterwards against, the Lancastrian party. As Lieutenant of Scotland he shared the defeat and flight at Bannockburn. In 1318 a Burgundian held him to ransom in Germany. He died near Paris in 1324, on an embassy.

Aymestrey Limestone, a well-marked horizon in the Ludlow group of the Upper Silurian. It is a somewhat dark-gray concretionary rock, consisting of thin beds which attain a united thickness in places of 150 feet. It is well developed at Aymestrey, in Herefordshire, near Leominster, but thins off entirely at no great distance from that place. One of its most characteristic fossils is *Pentamerus knightii*, a brachiopod.

Aymon, or HALMON, Count of Dordogne, whose sons, Alard, Richard, Guichard, and Renaut, were the chief heroes of one of the finest romances of the Carolingian cycle. The story seems to be originally French, and the first known work in which it is found is the poem, *Regnaud de Montauban*, by Huon de Villeneuve, written before 1200. It occurs in a prose collection of similar stories, published at Lyons about 1480, an English translation of which, most likely by Caxton himself, was printed about 1489 (reprinted from unique imperfect Althorp copy for Early English Text Society, 1884-85). The current German story which Tieck worked up, does not appear to be from the French original, but rather borrowed from a Dutch source. Ariosto's *Roland* has secured the brothers a more certain immortality in the part given to Renaut, the youngest and traditionally the bravest of the four.

Ayr, the county town of Ayrshire, at the mouth of the river Ayr, 40½ miles SSW. of Glasgow by rail. It is a clean and handsome town, the principal streets well built; while to the south, towards the racecourse, many elegant villas have sprung up of recent years. The Town's Buildings, with a spire 226 feet high, were erected in 1828, and rebuilt in 1901-2. The so-called 'Wallace Tower' is a Gothic edifice of 1834, 113 feet high. The County Buildings were modelled after the temple of Isis in Rome. The Academy, representing a school extant in 1233, was reconstituted in 1794-98; a new building was erected in 1880. Five bridges span the river, and connect Ayr proper with Newton-upon-Ayr and Wallacetown, two of them being the famous 'Twa Bigs' of Burns. Of these the narrow four-arched 'Auld Brig' (15th century) was restored in 1907-10, and the 'New Big' (1788) was rebuilt in 1879. There are bronze statues of General Neill, the Earl of Eglinton, and Robert Burns (1891). In the 12th-century church of St John was held Robert Bruce's parliament of 1315. It was turned into a fort by Cromwell, and the lower part of its tower, long a villa, was acquired in 1913 by the Marquis of Bute to save it from the speculative builder. The Carnegie Free Library was opened in 1893. The harbour, formed by the river, is protected by piers and a breakwater; improvements on it, including a wet dock and slip dock, have been carried out since 1874. The chief export is coal from the Ayrshire collieries. A considerable quantity of grain and timber is imported; and there are manufactures of lace and woollen fabrics, carpets, large saw-mills, &c. A splendid new water-supply, drawn from Loch Finlas, 20 miles distant, was introduced in 1887. At an early date Ayr was a commercial and military place of some importance. William the Lion made it a royal burgh about 1200. During the War of Independence, it formed a regular centre of military operations, and in 1297, while in possession of an English garrison, it was the scene (according to Blind Harry) of the burning by Wallace of the 'Barns of Ayr.' The principal objects of interest near Ayr are connected with the memory of Robert Burns (see ALLOWAY). Ayr unites with Ardrossan, Irvine, Prestwick, Saltcoats, and Troon in sending a member to parliament. The municipal burgh was in 1873 rendered continuous with the parliamentary, so as to take in Newton and Wallacetown, and was again extended in 1885. Pop. of the municipal burgh (1841) 15,749; (1881) 20,821; (1901) 28,697; (1911) 32,986; (1921) 35,741.

Ayrer, JACOB, next to Hans Sachs the most prolific and important German dramatic writer of the 16th century. His history is involved in obscurity; but it is known that he was a citizen of Nuremberg in 1594, and a procurator in the courts of law. His rhyming chronicle of the town of

Bamberg was edited by I. Heller in 1838. It was not till after his death, in 1605, that a collected edition of his dramatic pieces was published under the title *Opus theatricum*, consisting of sixty-six tragedies, comedies, and carnival plays (Nurem. 1618). He took his subjects from history, legend, and novels; some pieces are based on English plays. Ayer has the same garrulous breadth of dialogue as Hans Sachs, but is inferior to him in wit and humour. See the edition by Keller (5 vols. 1865) and the selection by Tittmann (1868).

Ayrshire, a large maritime county in the SW. of Scotland, washed on the W. by the Firth of Clyde and the North Channel. Its greatest length is 78 miles; its greatest breadth, 28; and its area is 1132 sq. m., or 724,523 acres, it being seventh in size of the Scottish counties. The general aspect of the county is undulating and hilly, the land attaining no great elevation, except a small portion in the north, and some considerable tracts in the south and south-east, which are mountainous. None of the eminences exceed 2562 feet, which is the height of Kierrieroch Hill. Loch Doon (5½ × ¾ mile) is much the largest of several fresh-water lakes; whilst the chief rivers—only 20 to 38 miles long—are the Ayr, with its tributary the Lugar, and the 'bonny' Doon, which flow across the centre of the county; the Garnock and Irvine in the north; and the Girvan and Stinchar in the south. To Ayrshire belong, too, the first 16 miles of the Nith, which passes out into Dumfriesshire. To the south of the Girvan the rocks are chiefly Silurian; to the north of it are patches of Old Red Sandstone and Carboniferous strata, with both of which igneous rocks are commonly associated. Ayrshire is rich in valuable minerals, especially coal, ironstone, limestone, and freestone. The other minerals have long been wrought, but it was from 1850 that the iron trade rose to great importance. Clays are also valuable. On the banks of the Ayr is found an excellent species of whetstone, called Water-of-Ayr Stone. The climate of Ayrshire is mild and healthy. The soil along the coast is light and sandy, interspersed with deep loam; and this district sends yearly to various markets vast quantities of early potatoes. On the east side are extensive mosses and moorlands. The three ancient divisions of the county are—Carrick, south of the Doon, mostly wild and hilly; Kyle, between the Doon and the Irvine, containing much rich level land, though towards the coast the soil is lighter and less productive; and Cunninghame, comprising all the country north of the Irvine, mostly fertile. Agriculture till 1800 was very backward; but since then extraordinary progress has been made in draining, improved rotation, and road-making; while the condition of the cottars has been much improved. There is a great trade in early potatoes, and carrots and mangolds are much grown. The percentage of cultivated area is high. The farms are generally small. Dairy-husbandry is carried to high perfection in Ayrshire, the breed of milch-cows, of which it rears a greater number than any other Scottish county, being noted as the finest in the kingdom for the quantity and quality of their milk. The Dunlop cheese, so called from the parish of that name, was almost as celebrated as Stilton, but since 1855 has been almost superseded by that made on the Cheddar process. The breed of horses is also excellent. Manufactures, especially woollen and cotton, are carried on to an important extent. There are extensive cotton-works at Catrine; at Kilmarnock, iron-foundries, carpet and tweed factories; dynamite and chemical works near Saltcoats and Irvine; and at Galston and Newmilns much lace is manufactured. Of the minor manufactures, the most characteristic is that of

ornamental woodwork, often bearing tartan designs, which is extensively carried on at Mauchline. Great iron-works exist at Muirkirk, Hurlford, Kilwinning, Kilbirnie, Ardeer, Dalry, and Dalmellington. Ayr and Maybole manufacture shoes and agricultural implements in very large quantities. There are valuable fisheries on the coast, whose headquarters is Ballantrae. Troon, Ardrossan, and Ayr are thriving ports. Pop. (1801) 84,207; (1881) 217,504; (1911) 268,337; (1921) 299,254. Ayrshire and Bute return three members to parliament. The chief towns, besides Ayr, are Kilmarnock, Givran, Maybole, Dalry, Kilwinning, Beith, Irvine, Stewarton, Old Cumnock, Ardrossan, Saltcoats, Troon, Mauchline, Galston, Newmilns, Kilbirnie, and Largs. Of antiquities, the most interesting are the ruins of Crossraguel and Kilwinning Abbeys; of 'Alloway's haunted kirk,' with the 'auld clay biggin,' Burns's birthplace, hard by; and of the castles of Turnberry (the family seat of Robert the Bruce), Dunure, Loch Doon, Dean, Dundonald, &c. Ayrshire was inhabited in the time of Agricola by the Damnonii, with whom were afterwards mixed the Scots from the opposite coast of Kintyre. It contains the battlefields of Largs and Loudon Hill; and during the religious persecutions of the Stuarts, it was a stronghold of the Covenanters. See James Paterson's *History of Ayrshire* (1847-52), and the publications of the Ayr and Galloway Archaeological Association (1878-90).

Ayton, SIR ROBERT, Scottish poet, was born at Kinaldie, Fife, in 1570, and entering St Leonard's College, St Andrews, in 1584, took his M.A. degree in 1588. For purposes of study he next visited France, whence he addressed, in 1603, an elegant Latin panegyric to King James, on his accession to the throne of England. This poem was the making of Ayton's fortune, for we find him appointed, successively, a gentleman of the bedchamber, private secretary to the queen, and master of requests—posts all continued to him in the following reign. He was knighted in 1612, and employed to convey copies of King James's *Apology for the Oath of Allegiance* to the German courts. Ayton was on terms of familiarity with all the poets, wits, and philosophers of his time—among others, Hobbes and Ben Jonson. He was himself a poet of considerable merit; but, unfortunately, a large number of his effusions being complimentary verses to his friends, are characterised by conceit and extravagant flattery. He was one of the first Scotsmen who wrote in English with any degree of elegance and purity. 'I do confess thou'rt smooth and fair,' and the prototype of 'Auld Lang Syne,' have been ascribed to him, but on scant authority. He died at Whitehall Palace, February 1638. See his *Poems*, with a Memoir by Dr Charles Rogers (uncritically in 1844, more carefully in 1871 and 1884).

Ayton, WILLIAM EDMONSTOUNE, born in Edinburgh, 21st June 1813, was educated at the Academy and the university, and for some months studied German at Aschaffenburg. In 1835 he became, like his father, a Writer to the Signet, and in 1840 was called to the Scottish bar. To his mother he owed his love of ballad-lore and Jacobitism, and, taking early to literary work, he entered in 1836 on his lifelong connection with *Blackwood's*; in 1845 was appointed professor of Rhetoric and Belles-Lettres in Edinburgh University, and in five years increased the number of his hearers fivefold. In 1849 he married a daughter of Professor Wilson; in 1852 was made sheriff of Orkney; and next year received from Oxford the honorary degree of D.C.L. His first two published works—*Poland, Homer, and Other Poems* (1832), and *The Life and Times of Richard I.* (1840), were succeeded in 1848 by *Lays*

of the Scottish Cavaliers, which established his reputation as a poet of the school of Sir Walter Scott, and which has run through thirty editions. The *Bon Gaultier Ballads*, a series of capital parodies (1855), were produced conjointly with Theodore Martin, as also were *Poems and Ballads of Goethe* (1858). Other works by him were *Firmilian, a Spasmodic Tragedy* (1854), which is almost too good for a parody; *Bothwell*, a long narrative poem in the measure and manner of Scott; an edition of the *Scottish Ballads* (2 vols. 1858); and *Norman Sinclair* (1861), a semi-autobiographical novel. Ayton was successful in quite opposite branches of literature—at once as a poet and humorist. His poems exhibit a ballad-like simplicity, and a fiery flow of narration; while his tales possess a certain robust humour and farcical abandonment. His poetical powers appear in their greatest perfection in the *Lays of the Scottish Cavaliers*; the special merits of his humour in *The Glenmutchkin Railway* and *How I became a Yeoman*. As a critic, he took up the knout of 'Christopher North,' which he wielded with no little force and dexterity. He died at Blackhills, near Elgin, 4th August 1865. See his *Life* by Sir T. Martin (1867), and a book by Miss R. Masson (1899).

Ayuntamiento is the name given in Spain to the councils or governing bodies of towns. Sprung from the institutions of the Romans, and firmly established during the long struggles with the Moors, the ayuntamientos acquired great influence and political power, the nobility being admitted to them without their class privileges. Although this importance was gradually impaired, and under the Bourbons the last shadow of municipal freedom was lost, the remembrance of it continued to be cherished by the people. Accordingly, the cortes, in 1812, adopted the leading features of the former system. On the return of Ferdinand VII., the ayuntamientos were abolished; restored in 1823; after the invasion by France, once more set aside; and again restored in 1837. The ayuntamiento, with the alcalde as president, was appointed by the free choice of the people. The government could provisionally annul its acts, but must afterwards procure the ratification of the cortes. The ayuntamientos were empowered to make up the lists of electors and jurors, to organise the national guards, to command the police within their own bounds, to direct the apportionment and raising of taxes, and to manage the funds of the commune. Subsequently they have been more than once modified, not without opposition, especially after the events of 1843. The municipal law of 1870 deprived them of all political authority, and regulated them as administrative bodies, subject in certain respects to the authorities of the provinces, the law courts, and the cortes.

Ayuthia, the ancient capital of Siam, stands on the Menam, 50 miles N. of Bangkok. It was founded in 1357, and was the capital until 1767, when it was sacked and half destroyed by the Burmese. In the 16th century it was three leagues in circumference, and was till about 1850 the second city of the kingdom. It is now called Krung-Krao. It is mainly built on piles over the water. Some magnificent buildings still remain, now crumbling into ruins and overgrown with luxuriant vegetation; notable amongst them are Buddhist temples, especially the 'Golden Mount,' 400 feet high. Pop. 50,000.

Aza'lea, a genus of the heath order (Ericaceæ), formerly distinguished from Rhododendron (q.v.) chiefly by the flowers having five stamens instead of ten. Most of the species of azalea also differ from the rhododendrons in having the leaves thin and deciduous instead of evergreen. Perfectly intermediate

forms have now been discovered, and by classifiers the two genera are therefore united under *Rhododendron*; the distinction, however, remains one of practical convenience. One of the species best deserving of notice is *A. pontica*, a shrub from 3 to 5 feet high, a native of Asia Minor, with lanceolate shining leaves and umbellate yellow flowers, which are externally covered with glutinous hairy glands, and are very fragrant. It may be regarded as, like many of the other *Ericaceæ* (heaths, &c.), a *social* plant; and its golden flowers give great brilliancy to the landscape in many parts of the Crimea, the south-east of Poland, the Caucasus, &c. It covers many mountain slopes, but does not ascend to great elevations, giving place to the more alpine *Rhododendron ponticum*. It is common in gardens and shrubberies in Britain, and varies with orange, red, and almost white flowers. The whole plant is narcotic and poisonous, and the honey collected by bees from its flowers, which greatly abound in honey, is said to cause stupefaction and delirium, as happened to Xenophon's soldiers in their famous retreat in Asia.—North America abounds in azaleas as well as in rhododendrons, and some of the species have been long cultivated in Britain, particularly *A. nudiflora* and *A. viscosa*, which, with *A. pontica*,

Flowering branch of Azalea (*Azalea viliflora*).

have become the parents of many hybrids. Both have nearly white flowers, very beautiful, and of delicious fragrance. *A. viscosa* has the flowers covered with glutinous hairs like *A. pontica*; but the flowers of *A. nudiflora* are nearly destitute of them. Both species abound from Canada to the southern parts of the United States. They are taller shrubs than *A. pontica*. Upon account of its sweet smell, *A. nudiflora* is called in America the Upright Honeysuckle. *A. calendulacea*, a native of the southern parts of the United States, is described as frequently clothing the mountains with a robe of living scarlet.—India and China produce several species of azalea, of which one of the finest is *A. indica*, well known in Britain as a greenhouse shrub. Its leaves are persistent, and its flowers exhibit great brilliancy of colours. Many hybrids exist between the more hardy species and this. Another extremely beautiful species is *A. viliflora*, an evergreen, which has been introduced into Britain from China, and is said to be quite hardy.

A diminutive, procumbent, evergreen heath, a native of alpine regions in Europe and North America, plentiful on high mountains in Scotland, was long known as *A. procumbens*, but is now called *Loiseleuria procumbens*. The flowers are small, solitary, and rose-coloured. The whole habit of the plant widely differs from that of the ordinary azalea.

Azamgarh, or **AZIMGURH** ('Azim's fort'), a town in the United Provinces of India. The town is situated on the river Tons, 81 miles N. of Benares. It was founded in 1665 by Azam Khan, a large landholder in the neighbourhood. The Europeans here were compelled to flee during the Mutiny of 1857; the native infantry murdered their officers, and carried off the treasure to Fyzabad. Pop. of town, 11,000, of whom about half are Hindus, the rest Mohammedans.—The district of Azamgarh in the Benares division, is low and remarkably level. The soil is fertile, excepting that tracts, amounting to more than a quarter of the whole, are irreclaimably barren, from being impregnated with soda, nitre, and other saline substances. Magnificent crops of rice, sugar-cane, and indigo are produced. Sugar, molasses, indigo, opium, and coarse cloths are the chief exports; the Gogra River forming the principal highway for trade. Area of district, 2147 sq. m.; pop. 1,500,000. In religion they are mostly Hindus.

Azara, a Mexican and South American genus of shrubs of the Flacourtiaceæ. One stipule is often so great as to look like a second leaf.

Azazel, a name occurring in Leviticus xvi., in the account of the rites of the Day of Atonement, explained by some as the 'scapegoat' which was led out into the wilderness laden with the sins of the people; by others, with much greater likelihood, as a designation of the being to whom the goat was sent—Satan, according to Hengstenberg, or a demon of the pre-Mosaic religion, according to Ewald.

Azeglio, MASSIMO TAPARELLI, MARCHESE D', famous as an artist, a publicist, a romance-writer, and a statesman, was the descendant of an ancient and noble family of Piedmont. He was born in 1798 at Turin, where his father held a high military position. In his fifteenth year, he followed his father to Rome, where he had been appointed ambassador, and there became passionately devoted to the fine arts; but had to accept an appointment in a Piedmontese cavalry regiment. Here he devoted his leisure with such intensity to scientific pursuits, that he brought on an illness which forced him to quit the service. After some difficulty, he got his father's permission to devote himself entirely to painting. A year had hardly elapsed ere Azeglio had made himself a name in Rome as a landscape-painter. On the death of his father in 1830, he went to Milan, and made the friendship of Alessandro Manzoni, whose daughter he married. He now began to make himself favourably known also in literature, his novels, *Ettore Fieramosco* (1833) and *Niccolò de' Lapi* (1841), having done much to fan the national spirit of the Italians. The political affairs of Italy soon occupied him exclusively; he traversed the provinces, cities, and villages, seeking to stir up the spirit of patriotism, and to conciliate the unhappy party divisions, and was everywhere received with rejoicing and acclamation. Azeglio never belonged to a secret political society, but opposed conspiracies as mischievous, and exhorted the impatient to moderation. While in Florence, he wrote his famous piece, *Degli ultimi casi di Romagna*, in which he lashed the miserable papal government, denounced the vain attempts at insurrection, and proved to the Italian princes the necessity of a national policy. After the election of Pius IX. as pope, he returned to Rome, and to his influence were ascribed the reforms with which Pius began his government. When Charles Albert, after the rising of Lombardy, crossed the Ticino, Azeglio left Rome with the papal troops destined to support the Italian contest. In the battle of Vicenza, where he commanded a legion, he was severely wounded. Scarcely was he recovered,

when with his pen he courageously opposed the republican party, now intoxicated with victory. On the opening of the Saidinian parliament, he was chosen a member of the Chamber of Deputies. After the unfortunate event of the battle of Novara, the young king, Victor-Emmanuel II., appointed him (1849) president of the cabinet, and his influence in this high position was most beneficial. At the close of the war in 1859, Azeglio was for a time military commissioner extraordinary for the Roman States. On his retirement he issued a proclamation to the people, which greatly tended to strengthen their resolution by its noble, yet temperate, advice. He died 15th January 1866. He wrote many works, mainly on public questions, and his political correspondence and an autobiographical work, *I miei Ricordi*, were published after his death. See the Lives by Pavesio (1871) and Bianchi (1884); and Bolton King's *History of Italian Unity* (1900).

Azerbaijan', a Tatar republic of the Caucasus, answering roughly to the former Russian governments of Baku and Elizabetpol, is bounded by the Caspian, Daghestan, Georgia, Armenia, and the Persian province of Azerbaijan. The main axis of the Caucasus (reaching 14,700 feet in Bazardyuz) crosses the north of the republic, and runs out into the Caspian as the peninsula of Apsheron, on which stands the capital, Baku, centre of the petroleum-field. The lower part of the Kur basin above, and partly below, the Aras (which for some distance is the Persian boundary) forms the greater part of Azerbaijan, and is made up of mountain and plateau in the west, steppe in the east, the latter dry, but exceedingly fertile under irrigation. The plain of Kuba lies north of the Caucasus; and a stretch of productive coast-land runs southwards from the Kur's mouth. From Baku run a railway and a pipe-line to Batum, a railway to Derbend and other parts of Russia, and one (under construction) to Djulfa to connect with Tabriz and Erivan. Besides petroleum, Azerbaijan produces copper, iron, lead, and cobalt. Cattle are raised. Cotton, vines, mulberry-trees, and rice and other cereals are grown. There is much forest; and the fisheries are valuable. The chief manufactures are petroleum, silk, copper, and carpets. The area is about 40,000 sq. m. The population is estimated at 4,600,000, mostly Mohammedan Tatars, with some 800,000 Armenians, and smaller numbers of Georgians, Kurds, Russians, Germans, and others.

Azerbaijan was ceded by Persia to Russia in 1813. At the revolution of 1917 it became part of the Transcaucasian republic, whose components (Azerbaijan, Georgia, and Armenia) became separate republics in 1918. Fighting between Azerbaijanis and Armenians followed. In 1920 a Soviet government was set up, and Azerbaijan entered into close relations with Russia.

Azerbaijan', or ADERBAIJAN, the ancient *Media Atropatene*, is the north-western province of Persia, bounded S. by Persian Kurdistan and Irak, E. by Ghilan, NE. and N. by the republic of Azerbaijan, and W. by Armenia and autonomous Kurdistan. It has an area of about 40,100 sq. m., and a pop. of 2,000,000. The surface of Azerbaijan is very mountainous, many of the ranges rising from 7000 to 9000 feet in height. The peak of Savalan (an extinct volcano), near Ardebil, reaches an elevation of over 13,000 feet. Mount Ararat rises on the north-west border. The chief rivers are the Aras or *Araxes*, the Kara Su, and the Kizil-Uzen. The salt lake Urmia (q.v.), or Urumiah, the largest in Persia, is situated in the west of the province. The climate of Azerbaijan is not unhealthy, but it is subject to rapid extremes of heat and cold. In the mountainous districts the hail-storms

are occasionally so violent as to kill cattle. The principal products are rice, barley, wheat, maize, flax, hemp, cotton, tobacco, honey, and saffron; camels, horses, cattle, and sheep are reared; velvet, silks, stuff, carpets, woollens, and leather are the most important articles of manufacture, and a little is done in hardware. Lead, iron, copper, sulphur, saltpetre, and salt are found in the province. The capital is Tabriz; other towns being Urmiah, Khoi, Selmas, and Ardebil.

Azhar, EL, a mosque and Mohammedan university of Cairo (q.v.).

Azilian. See ANTHROPOLOGY.

Azingurh. See AZAMGARH.

Azimuth of a heavenly body is the angle measured along the horizon between the north or south point, and the point where a circle, passing through the zenith and the body, cuts the horizon. It is usual to measure the azimuth westward from the point most remote from the elevated pole, beginning at 0°, and returning to it at 360°. Thus, in northern latitudes, where the north pole is elevated, the azimuth is measured from the south point, so that the east point, for instance, has an azimuth of 270° (see ARMILLARY SPHERE). The azimuth circles are those which extend from zenith to nadir, cutting the horizon at right angles, or those in which all the points have the same azimuth.

Azincourt. See AGINCOURT.

Azo Colours. See DYEING.

Azoic (Gr. *α-*, 'without,' *zōē*, 'life'), a term sometimes applied in geology to the Archæan crystalline schists (which underlie the oldest fossiliferous strata, and contain no fossils). See ARCHÆAN SYSTEM.

Azolla. See WATER-FERNS.

Azo'res, or WESTERN ISLANDS, a Portuguese archipelago in the mid-Atlantic, between 36° 55' and 39° 55' N. lat., and between 25° 10' and 31° 16' W. long. Stretching over a distance of 400 miles, their nine islands are divided into three distinct groups—Sta Maria and São Miguel in the SE; Terceira, São Jorge, Pico, Graciosa, and Fayal in the middle; and Flores and Corvo in the NW. Of these, Flores lies 1176 miles W. of Cape Roca in Portugal, 1484 SW. of Falmouth, and 1708 ESE. of Halifax. In 1431-53 the Azores were taken possession of by the Portuguese. They were at that time uninhabited; but that they had been visited by the Carthaginians is proved by Punic coins found on Corvo. They seem to have been known to the Arabian geographer Edrisi in the 12th century; and they are marked distinctly on a map of 1351. The Portuguese colonists called the whole group Azores, from *azor* or *azor*, a hawk; and they named two individual islands Corvo and São Jorge, from Corvi Marini and San Zoize, which, according to a map of 1375, had been previously seen in the western ocean. In 1466 Alfonso V. made a life-grant of the island of Fayal to his aunt, the Duchess of Burgundy. See GRENVILLE (SIR RICHARD).

Though popular as a winter resort, on account of their moist but equable temperature, the islands are decreasing in population. The total area of the group is 919 sq. m., and the population 243,000. The area and the maximum altitude of the different islands are as follows: Sta Maria (38 sq. m.; 1889 feet); São Miguel (299 sq. m.; 3854 feet); Terceira (164 sq. m.; 3435 feet); Graciosa (24 sq. m.); São Jorge (91 sq. m.); Pico (173 sq. m.; 7613 feet); Fayal (69 sq. m.); Flores (54 sq. m.; 3087 feet); Corvo (7 sq. m.). The chief towns are Angra (pop. 10,000), in Terceira; Ponta Delgada, in São Miguel (16,000); Horta, in Fayal (6000). The Azores are of volcanic origin, and with the excep-

tion of Corvo, Flores, and Graciosa, are liable to eruptions and violent earthquakes (as in 1444, 1591, 1638, 1719, and 1841). Hot mineral springs are numerous; and the baths of Furnas, in São Miguel, are much resorted to by invalids. The coast is generally steep and rugged; the interior abounds in ravines and mountains. As may be presumed from the density of the population, the soil is fertile, and the climate healthy. The islands are also admirably watered. From 80 to 90 per cent. of both fauna and flora are decidedly European; and only of the land molluscs are 60 per cent. indigenous. Pine-apples are the chief article of export, besides tobacco and cigars, wine, brandy, mineral water, beans, tea, maize, fruit, hides, cattle; the imports include coal (for re-export mostly), textiles, hardware, iron, glass, fertilisers, flour, matches, soap, timber, oil, fish, wines, rum, coffee, sugar, salt, and tea. Perhaps the greatest want of the group is a good harbour. The Azores are regarded as an integral part, not a colony, of Portugal (q.v.), and as belonging to Europe.

See Godman's *Natural History of the Azores* (1870), Walker's *Azores* (1886), and Mrs Roundell's *Visit to the Azores* (1889); and a guide-book by A. S. Brown (1905).

Azote (Gr. *α-*, 'not,' and *ζωέ*, 'life') is the name given by French chemists to Nitrogen (q.v.).

Azotised Bodies are those substances which contain azote or nitrogen as one of their constituents, and which form part of the living structure of a plant or animal, or are produced during its natural decay. The principal members of the group are *albumen*, present in white of eggs and the juices of plants and animals; *globulin*, or *crystallin*, a variety of albumen found in the lens of the eye; *vitellin*, another variety of albumen, composing the greater bulk of the yolk of the egg; *paralbumen*, a third variety of albumen found in the animal system during certain diseases; *fibrin*, which occurs largely in the seeds of cereals and in animal muscle; *casein* (or cheese matter), present in all milk; *legumin*, a variety of casein found in pease, beans, and leguminous seeds in general; *gelatin*, which is present in the skin, bones, and other parts of animals; *chondrin*, a variety of gelatin obtainable from the cornea of the eye and the permanent cartilages; *isinglass*, another variety of gelatin manufactured from the inner membrane of the floating bladder of sturgeons and other fishes; *glue* and *size*, which are secondary forms of gelatin; *urea*, *uric acid*, and *hippuric acid*, which are present in the urine of the higher animals; *kreatin* and *kreatinin*, occurring in the juice of flesh; several forms of *urinary calculi*, which are found as stones in the bladder; and the very large and important class of *alkaloids*, including strychnine, morphine, quinine, &c. The principal members of the series of azotised bodies will be considered under their special headings; and the use of several of them as articles of diet will be noticed under FOOD. For the importance of the nitrogenous element in nutrition, see DIET; and compare also the article DIGESTION.

Azo'tus. See ASHDOD.

Azov, a seaport of the Don Cossacks country, in the south of Russia, on the left bank of the Don, about 25 miles E. of Rostov, and within 6 or 7 miles of the Sea of Azov. The chief industries are gardening and fishing, but the town trades in grain, and serves as an outlet for the southern part of Russia. The population is about 30,000. Azov was built 9 miles from the site of the ancient Greek colony of *Tanais*, and was conquered by Mithridates, 115 B.C. It was successively under the rule of the Sarmatians, Huns, Khazars, and the Petchenegs, and was captured by the Russian prince Vladimir I. in the 10th century. When in

the 13th century it was taken possession of by the Genoese, they altered its name to *Tana*, fortified it by high walls and towers, and it became the commercial centre for the Indo-Chinese trade. They were driven out of it and the town sacked by Timur (Tamerlane) in 1392. In 1471 it was taken by the Turks, in 1696 by Peter the Great; and to Russia it was finally ceded in 1774 by the treaty of Kutchuk-Kainarji. It was bombarded and greatly injured by an allied English and French squadron in 1855.

THE SEA OF AZOV, named after the town, is a large gulf of the Black Sea, formed by the Crimean peninsula, or rather an inland lake connected with the Black Sea by the Strait of Yenikale or Kertch (anc. *Bosporus Cimmerius*), 28 miles long, and barely 4 wide at the narrowest. The intricate Siwash or Putrid Sea, which is a mere succession of swamps, is cut off from the western portion of the Sea of Azov by the long narrow slip of low sandy land called the Peninsula of Arabat. The ancient name of the Sea of Azov was *Palus Mæotis* or 'Mæotic Marsh,' from the Mæotæ dwelling on its shores; by the Turks it is called *Balık-Denghis*, or 'Fish Sea,' from its abundance of fish, in which it is scarcely equalled by any other sheet of water of like extent. The water is almost fresh, but varies considerably. The whole sea is shallow, from 3 to about 40 feet deep, and it is becoming shallower. Measuring 235 by 110 miles, it occupies an area of 14,500 sq. m. Its shores are generally low and sandy, with here and there a short strip of rocks. At its north-east extremity it becomes narrow and forms the Gulf of Taganrog. It has three ports, Taganrog, Mariupol, and Berdiansk. The sea receives several large rivers, the most important being the Don, near whose mouth the town of Azov is situated. A ship-canal across the Isthmus of Perekop, projected in 1888, was not constructed.

Azpeitia, a town in the Spanish province of Guipúzcoa, situated in a fine valley on the Urola, 18 miles SW. of San Sebastian. A mile from it is the famous convent of Loyola, now converted into a museum, built somewhat in the form of an eagle with outspreading wings by the Roman architect, Fontana, in 1683. It comprises a tower of the Santa Casa, in which St Ignatius of Loyola, the great founder of the Jesuits, was born in 1491. Here every year in July a great festival is held in his honour, to which pilgrims flock from all quarters. Pop. about 7000.

Azrael, also called Raphael, forms in Moslem mythology, together with Gabriel, Michael, and Israfil (or Uriel), the group of four highest angelic beings who surround the throne of God. Called the 'Angel of Death,' it is he who 'separates men's souls and bodies,' and with his assistants either 'tears them asunder with violence, or draws them apart with gentleness.' He is sent by Allah, and executes his commissions, having been promoted to his high office for his faithfulness and fearlessness. No unkindly idea is attached to him in the Moslem mind—he seems rather to have been identified with Fate, without any special malignant quality inherent in his nature. The Jewish rabbins have added to this awful figure the attributes of an evil genius, and 'the king of terrors,' the last enemy of man, in their conceptions has become almost the supreme embodiment of evil. See MOHAMMED.

Azrek, BAHR EL, the Arab name for the Blue Nile. See NILE, ABYSSINIA.

Aztecs, the race dominant in Mexico from the time they succeeded to the Toltec culture till they were conquered by the Spaniards. For their history and polity see MEXICO. But though the name is usually extended to all the semi-civilised

tribes of Nahuatlán (*Aztlan*, 'heron clan') stock in central and southern Mexico, it properly belongs only to a small group of seven related clans occupying the valley of Mexico and the adjoining country. Their tradition was that they had come from the north. The principal tribe had its capital at Tenochtitlán, now the city of Mexico, and by successive wars of conquest gradually acquired dominion over nearly all the tribes of southern Mexico, thus founding the empire of Mexico. Although possessed of a high degree of culture, the Aztecs were notorious for their cruelty and the bloody concomitants of their religious rites. Some of their descendants, comparatively pure in blood and retaining the ancient language, are still to be found in the outlying villages in the country round the city of Mexico. Individuals said to belong to this race, or even to the royal family, were repeatedly exhibited in Europe in the second half of the 19th century; and the physical peculiarities of these specimens, showing a melancholy degradation of mind, body, and especially of skull formation, has led to a special type of idiocy being called the Aztec type. It is marked by a low, retreating forehead, a projecting, sharp nose, and a weak, retreating chin; the face and head having altogether a strangely bird-like look.

Azua, capital of a like-named province of San Domingo, in the island of Hayti, on the Bia River, 60 miles W. of the town of Santo Domingo, with sulphur springs and a population of 20,000.

Azuaga, a town of Spain, in the province of Badajoz, 54 miles NW. of Córdoba, with which it is connected by rail; pop. 15,000

Azuay, a province in the south-west of Ecuador, named from El Azuay, a mountain mass in the eastern Cordillera, has an area of over 11,000 sq. m., and 135,000 inhabitants, mainly Indians. Agriculture and cattle-raising are the chief occupations. On its mountainous slopes the cinchona-tree grows abundantly. The capital is Cuenca (q.v.).

Azul, capital of a district in the province of Buenos Aires, in Argentina, on the river Azul and the railway to Bahía Blanca; pop. 10,000.

Azulejos is one name for the blue glazed tiles (Span. *azul*, 'azure') made by the Moslems of Persia, Egypt, and Spain for decorating wall surfaces. Some patterns were repeated century after century, and the Spaniards, who inherited the art of making them from the Moors, modified the designs and colours so slightly that it is not easy to distinguish between a Renaissance and an early medieval Spanish tile. The name is sometimes extended so as to cover Dutch blue tiles. See **TILES**, **PERSIA**.

Azun, a valley, sometimes called 'the Eden of the Pyrenees,' in the SW. of the French department of Hautes Pyrénées, watered by a tributary of the Gave de Pau.

Azuni, DOMENICO ALBERTO, a distinguished jurist, born at Sassari, in Sardinia, in 1749. He became judge of the Tribunal of Commerce at Nice, and in 1795 published a work in which he endeavoured to reduce maritime laws to fixed principles, and which appeared in French in 1805 under the title of *Droit Maritime de l'Europe*.

Napoleon appointed him one of the commissioners for compiling the new commercial code; and in 1807 he was appointed president of the Court of Appeal at Genoa. He published other minor works on various branches of maritime law, and a book on Sardinia. Ultimately he received a post at Cagliari, where he died on the 23d January 1827.

Azure, a French word technically used in Heraldry to signify blue. In engraving arms, it is always represented by horizontal lines.

Azurine, or BLUE ROACH, of Knowsley, in Lancashire, described by Yarrell as a distinct species, *Leuciscus caeruleus*, allied to roach and Rudd. It was distinguished mainly because of its colour—silvery, with a slate-blue back and pale fins. Ichthyologists now regard it simply as a Red Eye (q.v.) or Rudd (*Scardinius* or *Leuciscus erythrophthalmus*). It is a fresh-water fish, and though very rare in Britain, is not uncommon in some parts of the Continent—e.g. in some of the Swiss lakes.—Azurine is also the name of a blue-black aniline dye.

Azurite, a name which used to be given to the mineral more commonly called Lazulite (q.v.), to which, along with Lapis Lazuli (q.v.) or *Azure-stone*, mineral turquoise (see **TURQUOISE**), &c., the generic name *Azure Spar* is sometimes given.—The name azurite is also applied by mineralogists to an ore of copper, generally known as *Blue Copper* or *Chessylite* (see **COPPER**), nearly allied to Malachite (q.v.), and remarkable for its beautiful azure colour. Siberian azurite is cut into slabs and used as veneering for tops of tables, mantelpieces, and the like. Crystals of azurite, found in Arizona, are prized as gems, although they are too small to have a recognised commercial value as such. In various parts of the United States amorphous azurite is utilised as a valuable copper ore; it may even be made to serve as a blue pigment.

Azygy is a term in anatomy for 'singleness' as used of any structure or part which has no fellow on the opposite side of the body; thus the splenoid, some single veins, the thyroid gland, are said to be azygous (Gr. *azygos*, 'unwedded'). The *azygos uvulae*, the muscle of the uvula, was so named under the mistaken idea that it was a single muscle, while it is really a conjoined pair. The azygous artery is an artery of the knee-joint. The azygous veins are three veins of the trunk—one on the right side and two on the left.

Azymites, a name given reproachfully by the Orthodox Eastern Church to the Western, because the Western Roman Communion insisted that in the eucharist unleavened bread (Gr. *α-*, 'not,' and *ζυμῆ*, 'leaven') should be used, whereas the Greeks consecrated only leavened bread (see **HOST**). The use of unleavened bread in the Latin Church may be traced to the 9th century, and figured in the long and bitter controversy between East and West from the 11th century (see **GREEK CHURCH**); and the authoritative longer catechism prepared by Archbishop Philaret (q.v.) in 1839 maintains the oriental doctrine with unabated energy as demanded by the name of bread, by the holiness of the mystery, and by the example of Jesus Christ and the apostles. Armenians and Maronites also use azyms or azymes—a term also extended to the Jewish unleavened bread (see **PASSOVER**).

B

the second letter of our alphabet, descends from the second letter of the ancient Semitic alphabet. The earliest known form of this letter (9th century B.C.) is . Its original name, represented by the Hebrew and Syriac *bēth*, and adopted by the Greeks as *bēta*, is probably

identical with the Semitic word for 'house' (Assyrian *bītu*, Hebrew *báyit*, Syriac *baithō*). It is possible that the prehistoric original form of the letter was a rude drawing of a house, but the oldest known form affords no evidence of this; the common hypothesis that the 'house' referred to was a tent is unlikely, as the inventors of the alphabet were probably not tent-dwellers. In the Aramaic variety of the Semitic script the letter was opened at the top, assuming the form , whence the 'square Hebrew'  and the Syriac .

In early Greek inscriptions the letter had many forms, curiously different from each other and from the Semitic prototype. One of these forms was , which may perhaps have been evolved from the Semitic by turning the tail round to meet the stem. When the original right-to-left direction of the writing was reversed, this became , which, rounded into , ultimately superseded all the other forms.

The Romans adopted the letter in the form , and shortened its name *bēta* into *bē*, on the pattern of which they formed the names of the other letters denoting stopped consonants, *cē*, *dē*, *gē*, &c. In Roman cursive the upper loop of the letter was omitted, so that its form became *b* (there was a variant *d*, which is not so easy to account for). The derivation of the modern script and printed forms of the letter, capital and minuscule, from the Roman *B*, *b*, is in general too obvious to need explanation. The only form that is at first sight puzzling is the German script capital . This is

an alteration of an earlier  (the origin of which is evident), the right-hand loop being opened and lowered to facilitate joining with the following letter. The minuscule script  is the result of a similar process.

The sound which the letter originally expressed in Semitic, and with which it was adopted by the Greeks and from them by the Romans, was that of our English *b*—the bilabial voiced stop. In many languages independently, this sound has, in certain positions, changed into the corresponding spirant—i.e. into a bilabial *v*, which sometimes underwent further development into the dental labial *v* (as in *vine*). Where this sound-change occurred without producing an alteration in the mode of writing, the letter *B* or its equivalent necessarily acquired a new phonetic value. Thus in later Hebrew and Aramaic, though not in the other Semitic languages, it is sounded as *v* (bilabial) when following a vowel,

but elsewhere as *b*. (In 'pointed' Hebrew and Syriac texts this diversity of pronunciation is indicated by diacritic marks.) In modern Greek *B* is pronounced *v*, and with this power it was adopted into the Slavonic alphabet, which has a new letter () for *b*. In late Latin *B* between vowels was pronounced *v*; of the modern descendants of Latin, Spanish alone retains the Latin symbol (as in *haber*), while the others write *V* (Italian *avere*, French *avoir*, Portuguese *haver*). In the earliest Old English the sound *v* was, after Latin example, expressed by *B*; later this was replaced by *F*. In Continental Old Saxon the spirant sound (= *v*) was distinguished from the stopped sound of the letter by using the 'barred' form  for the former. In Irish the letter had originally both its late-Latin values; later Irish, when written in the native character, expresses the spirant sound by ; when ordinary Roman letters are used, this is represented by *bh*, which is also similarly used in Scottish Gaelic.

In various languages the sound of *b* has minor diversities of articulation that cannot be noticed here. It may be mentioned that 'voiced' consonants are usually uttered with less force than the related 'voiceless' ones (whence the designation 'soft' applied to *b* in contradistinction to the 'hard' *p*), and that in some German dialects the difference between *p* and *b* (which are both voiceless) is merely that the latter is 'softer.'

B, in Music, is the seventh degree of the diatonic scale of C. In the German notation *B* is called *H*, while *B* flat is called simply *B*. See MUSIC, H.

Baader, FRANZ XAVER VON (1765–1841), born at Munich, studied medicine and (in England) mining engineering. Hume's philosophy jarred terribly on his deep sense of the reality of religious truths. Indeed, he regarded all modern philosophy as atheistic in its tendencies, and the ethical autonomy of Kant, that man is in himself a rule of action, was particularly offensive to him. He became superintendent-general of mines, and retired in 1820. In 1826 he was appointed professor of Philosophy and Speculative Theology in the new university of Munich. His philosophy draws its inspiration from Jacob Boehme (q.v.), and is essentially a theosophy, of which the notion of God is the fundamental idea, the divine nature its first problem. His system is based largely on the necessary attributes of God. He holds that the true ethical end is not obedience to a moral law, but a realisation of the divine life; and that as man, alienated from God, has lost the power to attain this, therefore no ethical theory which disregards the facts of sin and redemption can be satisfactory.

Ba'al, the principal male deity of the Phœnician and Canaanitish nations, as Ashtoreth was the principal female deity. The Bel of Babylon and Assyria and the Phœnician Baal both bore the title of Bel-Ba'ab, 'lord'; and the name probably belonged to many local gods. Baal, the ruler and vivifier of nature, became a sun-god; later his sovereignty in the moral world also was conceived.

The oldest form of his cultus was a nature-worship on the tops of mountains; thus the Midianites and Amalekites worshipped him on Horeb and Sinai, the Moabites on Mount Peori, the Phœnicians particularly on Carmel, the Canaanites of the interior on Hermon. There were no representations of Baal, but his presence was symbolised by upright conical stones, which in earlier times were erected in the open air, but later in temples, and are supposed to have had a phallic significance. In contrast to Baal, the genial and fructifying power of nature, stood Moloch, the god of the sun in his destructive side, and the personification of the sterner side of nature. Later both conceptions were united together in the person of Melkart, the supreme god of the Phœnicians. Melkart is usually supposed to mean 'king of the city'—i.e. Tyre. The Greeks confounded Baal or Melkart with their own Herakles, and for the purpose of distinction termed him the Tyrian Herakles. From the foundation of Tyre, he seems to have been the tutelary god of that city, and his worship apparently extended thence until it was prevalent in all the towns of the Phœnician confederation, and was established in their remotest colonies, such as Malta, Carthage, and Cadiz. The worship of Baal had a powerful fascination for the early Israelites before the idea of a pure monotheism had been fully grasped by the popular imagination.

The word enters into the composition of many Semitic names, as Jezebel, Hasdrubal, Hannibal, Baalbek. It is often found in conjunction with some epithet, denoting a different deity, or possibly the same regarded in another aspect, and as exercising merely a different function. Thus, we have Baal-Berith ('the Covenant Lord'), who was specially worshipped by the people of Shechem; Baal-Peor, the Priapus of the Moabites and Midianites; and Beelzebub, or Baalzebub ('the Fly-god'), the idol of the Philistines at Ekron, where he had a temple.—The Celtic deity Beal was often confounded with Baal by the earlier mythologists.

Baalbek, a ruined city of Syria, on the Damascus-Aleppo railway, 35 miles NNW. of Damascus. The name ('City of Baal,' the Sun-god) was by the Greeks translated 'Heliopolis.' It was the most magnificent of Syrian cities, full of palaces, fountains, and beautiful monuments. The most imposing ruin is that of the Great Temple, which

Ruins of the Great Temple at Baalbek, with the Lebanon Range. (From a Photograph by Frith.)

was a rectangular building, 290 feet by 162, having its roof supported by a peristyle of 54 Corinthian columns, 19 at each side, and 10 at each end. Of these, six are yet standing. The circumference of these columns is 22 feet, and the

length of the shaft 55½; with pedestal, capital, and entablature, they measure 88 feet in height. The approach to this temple was through a portico (40 × 248 feet), a hexagonal hall (193 × 255 feet), and a grand quadrangle (411 × 440 feet). Except the columns mentioned, little of the great temple, or of the buildings in front of it, is left standing, but the ground is covered with their ruins. The vast size of the stones used in the Cyclopean substruction or platform (1052 × 318 feet) is remarkable, three of them being more than 60 feet long and about 13 feet square. South of the great temple is a smaller one, known as the Temple of Bacchus. It is similar in form, having its peristyle and the walls of its cella still mostly standing. Its dimensions are 228 feet in length by 124 feet in breadth, being thus larger than the Parthenon at Athens. Both temples, as well as the surrounding structures, are built of limestone, in a richly decorated somewhat fantastic Corinthian style. Besides these, there stands in the village of Baalbek, at the distance of 300 yards from the others, a circular building, supported on 6 granite columns in mixed Ionic and Corinthian style. Down to the 18th century it was used as a Greek church.

The early history of Baalbek is involved in darkness; but it is certain that, from the most distant times, it had been a chief seat of sun-worship, as its name implies. Julius Cæsar made it a Roman colony, and under Augustus it was occupied by a Roman garrison. Baalbek had an oracle held in such high esteem that in the 2d century A.D. it was consulted by the Emperor Trajan prior to his entrance on the second Parthian campaign. Antoninus Pius (138–161 A.D.) built the Great Temple, which the natives nowadays ascribe to Solomon. This temple is said to have contained a golden statue of the sun-god, which on certain annual festivals the chief citizens of Heliopolis bore about on their shoulders. When Christianity had become the dominant religion, the Emperor Theodosius the Great built a Christian church in the great quadrangle. In the wars that followed the taking of the city by the Arabs, who sacked it in 748 A.D., the temple was turned into a fortress, the works of which are yet visible. The city was completely pillaged by Timur Beg in 1400. Both city and temple continued to fall more and more into decay under the misery and misrule to which Syria has been subject ever since. Many of the magnificent pillars were overturned by the pashas of Damascus merely for the sake of the iron with which the stones were bound together. What the Arabs, Tatars, and Turks had spared was destroyed by a terrible earthquake in 1759. After 1901 the German Archaeological Institute carried out extensive clearances, and propped up many blocks and masses threatening to fall; the plans of the greater buildings are now much more fully known.

See R. Wood and Dawkins's *Ruins of Baalbek* (1757); Renan's *Mission de Phénicie* (1864); Frauberger's *Akropolis von Baalbek* (1891); Fuchstein's *Führer durch die Ruinen von Baalbek* (1905).

Baba ('the old'), in Slavonic Mythology, originally a thunder-witch (the devil's grandmother), was represented as a little, ugly old woman, with a monstrous nose, long teeth, and dishevelled hair, flying through the sky in an iron mortar.

Baba, a Turkish word signifying 'father,' originating, like our word *papa*, in the first efforts of children to speak. In Persia and Turkey it is prefixed as a title of honour to the names of ecclesiastics of distinction, especially of such as devote themselves to an ascetic life; it is often affixed in courtesy, also, to the names of other persons, as Ali-Baba.

Baba, CAPE, a bold rocky headland near the western point of Anatolia—the *Lectum* of the Greeks—about 12 miles from the northern extremity of Mitylene, the ancient Lesbos.

Babassu, an oil-yielding nut, from Brazilian palms of the genus *Attalea* (q.v.).

Babatag, or BABADAGH, a city of Rumania, with 3000 inhabitants, in a marshy district of the Dobrudja, 2½ miles W. of Lake Razim. The importance of the place has declined since the Dobrudja ceased to be Turkish in 1878.

Babbage, CHARLES, born 26th December 1791, at Totnes, Devonshire, entered Trinity College, Cambridge, in 1811, but graduated from Peterhouse in 1814. Two years later he was elected an F.R.S., and from 1828 to 1838 he filled the sinecure of Lucasian professor of Mathematics at Cambridge. He united, in the most happy combination, powers of invention and observation with thorough scientific culture. Foremost among his eighty writings is his extremely correct and well-arranged *Table of Logarithms* (1827), he being the first to make the method of constructing such tables the object of earnest study. As early as 1812 the idea had occurred to him of a Calculating Machine (q.v.); and by 1822 he had constructed a small model of one. Commissioned by government to superintend the construction of a larger and improved machine, after four years' operations he devoted a twelvemonth to visiting a great many workshops and factories on the Continent, in order to become acquainted with all the resources of mechanical art, and thus be in a position to use them in his great undertaking. This survey afforded him the necessary information for his able work *On the Economy of Manufactures and Machinery* (1832)—a book that in three years ran through four editions, and was translated into four languages. In it all mechanical processes are classified from the most scientific point of view, and the most interesting examples of the more important kinds of manufacture are described. Besides his *Comparative View of the Various Life-assurance Societies* (1826), *Ninth Bridgewater Treatise* (1837), *Decline of Science* (1831), *The Exposition of 1851* (1851), and the autobiographical *Passages from the Life of a Philosopher* (1864), Babbage contributed many very interesting papers to the Transactions of the Royal Societies of London and Edinburgh. His calculating machine, which cost £6000 of his own money, and £17,000 of the nation's, was abandoned by government in 1842, after eight years of circumlocution, and is now preserved in an unfinished state in the South Kensington Museum. In his later years he was chiefly known by his fierce hostility to organ-grinders. He died 18th October 1871.

Bāb-ed-Din. See BĀBĪ.

Babel, TOWER OF. According to the story in Gen. xi., the nomadic Semitic tribes journeyed eastwards, and entered the plain of Shinar (a Hebrew term for Babylonia). Settling there, they determined to build a city and a tower whose top should reach to heaven. Their project roused the jealousy of Jehovah, and as a punishment for their presumption he determined to 'confound their language that they might not understand one another's speech,' and scatter them over the face of the earth. The name of the city was henceforth called Babel, or confusion (Hebrew *balbel*). This explanation of the word, however, is due to false etymology. Babel is not derived from the Hebrew *balbel*, but from the Assyrian *Bab-ili* = 'the gate of God.'

The tower which was projected evidently resembled the Babylonian *zikkurat*, which was the most conspicuous feature of the temples in Babylonia. The *zikkurat* was a huge pyramidal tower

rising in seven terraces from the centre of the temple-area, and crowned with a shrine at the top.

It used to be thought that a Babylonian parallel to the Genesis story had been found in some fragments of a cuneiform text discovered by George Smith (British Museum Inscription K3657). The cuneiform mentions certain men who repudiated the father of all the gods, and began to build in Babylon 'a mound' or hill-like tower, but the winds blew down their work, and Anu confounded great and small on the mound, as well as their speech. Most modern scholars, however, deny that there is any connection between the two stories. The crucial words for 'tower' and 'speech' in the cuneiform are of uncertain meaning. Moreover, as Gunkel and Driver have pointed out, 'the narrative reflects the impression which Babylon would make upon a foreigner rather than that which it would make upon a native: the unfavourable light in which the foundation of Babylon is presented, the idea that the erection of what can hardly have been anything else than a Babylonian *zikkurat* was interrupted by a Babylonian deity, the mention of brick and bitumen as unusual building materials, and the false etymology of the name Babel are all features which are not likely to have originated in Babylonia.'

It is not unlikely, however, that some gigantic pyramidal tower in Babylon which was left uncompleted or allowed to fall into a state of disrepair may have formed the original basis of the story. Some scholars have identified the tower with the *zikkurat* of E-zida in the temple of Nebo at Borsippa, which we know from inscriptions was left unfinished till the time of Nebuchadnezzar, and the ruins of which still survive in the pyramidal mound known as *Birs Nimrud*. Others think that the origin of the story is more likely to be found in the tower of E-sagil in the famous temple of Marduk in the city of Babylon itself.

But whatever may be the origin of the story, there is no doubt as to its meaning and significance. As soon as men began to reflect at all, they were bound to ask themselves the question, How can the diversity of races and the diversity of language be explained? The story of the tower of Babel supplied an answer which was suited to the comprehension of a primitive race. As Bishop Ryle, in his *Early Narratives of Genesis*, puts it: 'Just as Greek fable told of the giants who strove to scale Olympus, so Semitic legend told of the impious act by which the sons of men strove to raise themselves to the dwelling-place of God, and how Jehovah interposed to frustrate their purposes.' The story, therefore, must not be explained as literal history, but rather as an early and naive attempt on the basis of myth to explain a difficult problem.

See BABYLONIA; Ryle, *Early Narratives of Genesis*; Sayce, *Chaldean Account of Genesis*; commentaries on Genesis by Delitzsch, Dillmann, Driver, and Skinner; Gunkel, *Schöpfung und Chaos in Urzeit und Endzeit* (1895).

Bab-el-Mandeb (i.e. 'the gate of tears'), so called from the danger arising to small vessels from strong currents, is the name of the strait between Arabia and the continent of Africa, by which the Red Sea is connected with the Gulf of Aden and the Indian Ocean. The Arabian peninsula here throws out a cape, bearing the same name as the strait, rising to the height of 865 feet. About 15 miles distant from this cape stands the wall-like coast of Africa, rising in Ras es Sean to the height of over 400 feet. Within the straits, but nearer to Arabia, lies the bare rocky island of Perim (q.v.), since 1857 occupied by the British as a fort; its guns command the entrance to the Red Sea. The strait on the east side of this island is called the Little Strait, and that on the west the Great Strait.

Bab'ér (Zehir-Eddin Mohammed), the first of the Great Moguls in India, a descendant of Timur, was born in 1483. He was barely 12 years of age when he succeeded his father, Omar Sheikh Mirza, in the sovereignty of the countries lying between Samarkand and the Indus. Driven more than once from his paternal dominions by the usurpation of his uncle and the revolts of his nobles, he made himself master, by prompt and daring movements, of the provinces of Kashgar, Kunduz, Kandahar, and Kabul. Having thus opened the way to India, he made two or three rapid incursions into Hindustan; and finally, about the end of 1525, taking advantage of the feeble government of Ibrahim Lodi, the Afghan emperor of Delhi, he crossed the Attock (the Kabul branch of the Indus), quickly defeated some bodies of troops that opposed him in the Punjab; and at last, in April 1526, on the plain of Panipat, not far from Delhi, encountered and fought a decisive battle with his enemy, whose army was far superior in numbers. The 100,000 men and 1000 elephants of Sultan Ibrahim were dispersed; Ibrahim himself fled; and Baber made his entry into Delhi. In the following month, Agra, the second city of the empire, surrendered. Baber's enjoyment of empire in India was brief; he died in 1530, having had to contend during the five years of his reign with numerous conspiracies and revolts. To the talents of a general and statesman, which he manifested alike in his conquests, his improvements of public roads, measuring of lands, adjustment of taxation, and his postal arrangements, Baber (which means 'the Tiger') united a taste for science and art. He wrote Turki poems (ed. Ross) and a vivid and entertaining history of his own life, which was translated (from the Persian) by Leyden and Eiskine (1826; revised 1921), Mrs Beveridge (1912 *et seq.*); abridged by Caldecott (1844) and Talbot (1910). His daughter Gul Badan Begam's memoirs (*The History of Humayun*) are also extant (trans. by Mrs Beveridge, 1903). 'Baber the Turk,' though founder of the 'Mogul' dynasty, regarded actual Mughals, or Mongols, with dislike. He was succeeded by his son Humayun. See INDIA, and Stanley Lane Poole's *Bábar* (1899).

Babeuf, FRANÇOIS NOEL, communist, was born in 1760 at St Quentin, was a land-surveyor in Picardy, and on the breaking out of the Revolution became a keen revolutionary; in 1790 he received honourable mention from Marat in his paper, *The Friend of the People*. As one of the extreme left, he opposed Robespierre during the Reign of Terror. In 1793 Babeuf had started a newspaper, to which in 1794 he gave the name of *Tribune of the People*; and he began to sign himself 'Gracchus Babeuf.' In this paper he advocated the most violent measures; particularly a rigorous system of communism, by which private property should be abolished, and the fruits of the common industry placed in a common magazine, from which they should be distributed with the most scrupulous equality. A secret conspiracy was formed, the aim of which was the destruction of the Directory and the establishment of an extreme democratic and communistic system. The plot was discovered, and Babeuf and other chiefs were brought to trial. Babeuf was condemned to death, and guillotined in 1797. He was an enthusiast, without talent or culture, but was a forerunner of the social revolution. See E. Belfort Bax, *The Last Episode of the French Revolution* (1911).

Bábí, a modern Persian sect, derived from the title, *Báb-ed-Din* ('gate of the faith'), assumed by its founder, Mirza Ali Mohammed, born at Shiraz in 1821, who in 1844, after a pilgrimage to Mecca, undertook to form a new religion from a mixture of Mohammedan, Christian, Jewish, and

Parsee elements. His controversies with the *mol-lahs* shortly led to his confinement in various towns, where he formulated his doctrines, privately instructed his disciples, and increased his claims. He sent out missionaries in various directions, the most famous of whom was a woman, Gurréd-ul-Ain ('consolation of the eyes'), remarkable for beauty and intelligence, and skilled in poetry, who preached against polygamy. The sect soon became numerous, and were not molested by the reigning shah; but on the accession of Nasir-ed-Din in 1848, apprehending persecution, they took up arms. Several Persian armies were routed, but finally the insurgents were reduced by famine, and most of them executed (1849-50). The Báb had held aloof from the revolt, but he was arrested and put to death, after imprisonment, in 1850. An attempt of three believers to assassinate the shah in 1852 led to a terrible persecution of the sect, when Gurréd-ul-Ain was put to death with many others. The Báb's successor was found in a Teherani, Mirza Huseyn Ali, born in Nur in 1817, to whom was given the name Baha-Ullah ('splendour of God'). He was believed by the great majority of the Bábis—now known as Bahais, or Behais—to be the most complete incarnation of the Son of God, foretold by the Báb, though a small party (Ezeli) adhered to his half-brother Mirza Yahya, called Subh-i-Ezel. Baha-Ullah and others had taken refuge from persecution at Baghdad, whence they were removed by the Turkish government to confinement in Constantinople, in Adrianople, and finally in Acre, where he died in 1892. He was succeeded, not without a new schism, by his son Abbas Effendi, called Abdul Baha ('servant of the splendour'), who was born in 1844, on the day on which his father first made known his claim that he was 'He whom God shall make manifest.' He shared the imprisonment of the community at Acre until the revolution of 1908. Thereafter he lived in Acre and in Haifa, and made many missionary journeys in Europe and America, and died (a K.C.M.G.) in 1921. Baha developed the system, which has Pantheistic and Gnostic elements, is essentially anti-priestly, and seeks to comprise the essence of all true religions. Revelation is held to be not final, but progressive. Universal peace, toleration, and friendship are essential principles. Baháism enjoins few prayers, and those only on fixed occasions; encourages hospitality and charity; prohibits polygamy, concubinage, and divorce; discourages asceticism and mendicancy; and directs women to discard the veil, and share as equals in the intercourse of social life. It is maintained that a fifth of the population of Persia are Bábis or Bahais, and they are found in Egypt, Algeria, Morocco, and northern India, converts having been made from Sunnis as well as Shiahs, from Hindus and Sikhs; in Ceylon, China, and even Japan, from Buddhists; and many adherents are to be found in Europe and, especially, in the United States. Their total numbers are computed by millions. See books by E. G. Browne (1891-1918), M. H. Phelps (1914), Eric Hammond (1909), and T. K. Cheyne (1914); also SUIFISM, and Malcolm's *Five Years in Persia* (1905).

Babington, ANTONY, was born of an old Catholic family at Dethick, Derbyshire, in 1561. Young, handsome, rich, left an orphan at ten years of age, he had served for a short time as page to Queen Mary of Scotland, then a prisoner at Sheffield, when in 1586, some seven years after his marriage, he was induced by Ballard and other Catholic emissaries to put himself at the head of a conspiracy that had for its object Elizabeth's murder and Mary's release. Babington reserved the deliverance of Mary for his own share, entered into correspondence with her, and received from her letters approving of the assassination. The

plot was betrayed, and after hiding in the depths of St John's Wood and at Harlow, he was taken, and with thirteen others condemned to die. His prayers for mercy, his explanation of the cipher letters, were all in vain, and on 20th September 1586 he followed Ballard to the scaffold.

Babington, CHURCHILL, an archæologist and classical scholar of wide and varied learning, was born at Roelcliffe, Leicestershire, in 1821. He studied at St John's College, Cambridge, was professor of Archæology in that university (1865-80), and rector of Cockfield, Suffolk, from 1866. Besides editing the newly discovered fragments of Hypereides, he wrote on botany, ornithology, archæology, and edited Higden and Pecoock. He died in 1889.—CHARLES CARDALE BABINGTON (1808-95), field botanist, archæologist, professor of Botany at Cambridge, was his cousin.

Babiroussa (*Sus babirusa*), a species of hog, according to some a distinct genus, inhabiting marshy forests in Celebes and some of the smaller islands of the Eastern Archipelago. The canine

Fig. 1.—Babiroussa (*Sus babirusa*).

teeth in the male are very large, the upper ones being curved towards the top of the head, and so like horns at first sight that the animal is often called the horned or deer hog. It is a nimble animal than the common hog, and has much more slender legs. It swims well and frequently, is fond of eating maize, and is often killed for the sake of its flesh. It is of interest, however, mainly on account of the extraordinary development of the canines in the male. The teeth, like those of rodents (see **TEETH**), grow from persistent pulps, and thus admit of that extension which doubtless occurred at first as an abnormal variation, but has now become a constant character in the males. In the wild boar (fig. 2), wart-hog, &c., the upper canines, even in the female in some instances, tend similarly to curve upwards. This variation, rendered possible by the persistent pulp, and by a slight mobility of the teeth in their sockets, seems largely due to some slight displacement preventing the

Fig. 2.—Tooth of Wild Boar.

upper and lower canines from meeting and limiting one another as they ought normally to do. The frequent habit of rubbing the snout and teeth against hard objects would readily account for an initial displacement. What occurs to a slight extent and occasionally in certain hogs, as the result of slight divergence, bringing about failure of apposition, and thus permitting overgrowth, is present in the male babiroussa as a constant and exaggerated feature. The peculiarity is either transmitted by inheritance, or reappears in every male in response to the constant re-occur-

rence of the same conditions. In specimens kept in captivity the variation has been known to become even more exaggerated. Mr Sutton discusses this interesting development in his *General Pathology* (1886), and notes a case from the Zoological Gardens in London where the upper canines of a babiroussa, which was fond of rubbing its tusks, exhibited a

Fig. 3.—Skull of Babiroussa (from Sutton).

very marked circular development, and would have penetrated the skull had they not been repeatedly cut (fig. 3). Though it is unreasonable to expect to find a use for every variation, it cannot be doubted that these exaggerated canines are of use to the males in fighting for the females, and are to some extent at least an outcome of the general characteristics of the sex. See **SEX**.

Baboo. See **BABU**.

Baboon, or **CYNOCEPHALUS** (i.e. 'dog-headed'), or **PAPIO**, a genus of Old-World monkeys, with numerous species such as mandrill, drill, sphinx, chacma, and hamadryas. They are at home in Africa, but spread into adjacent parts of Asia. Their most striking characters are the plump form, the prominent snout, the large canine teeth, the capacious cheek-pouches, the ugly callous cushions on which they sit, and the frequent shortness of tail.

Animals so abundant, ferocious, and repulsively ugly as the baboons could not escape the observation of the ancients. Aristotle was impressed by the pig-like muzzle of the mandrill, to which he gave the expressive name of *Chæropithecus*, or hog-ape, and even the comparative indifference of the next eighteen centuries to zoological facts was repeatedly interrupted by the hideous vision of some baboon. But long before Aristotle, the baboon had been an object of veneration in Egypt, and was especially sacred to, and typical of, Thoth, the lord of letters. Egyptian monuments are thus frequently adorned with statues and figures of baboons, and their mummies are still occasionally found. They held a less honourable place in the middle ages as curious pets in any completely equipped fashionable establishment. Nor is it so long since the mandrill, Jerry of the Surrey Gardens, used to be brought to amuse George IV. They are mischievous and voracious animals, and often commit devastations on plantations and other property.

Distribution.—Fossil remains seem to show that the baboons had once a much wider distribution than the now living species. They have, however, kept their footing well, being widely distributed throughout Africa. The drill and mandrill frequent the west coast (Guinea); the baboon proper inhabits wilder and more inland regions from Abyssinia and Kordofan inwards; the chacma and sphinx have rocky homes in the south and west respectively; the hamadryas has its seat among

the coast mountains of Abyssinia, south Nubia, and western Arabia. The geladas of the Abyssinian highlands are usually referred to a separate genus, *Theropithecus*. The small black baboon of Celebes is also regarded as representing a separate genus, *Cynopithecus*.

Structure.—The dog-shaped head, with its long muzzle and almost constantly terminal nostrils; the capacious cheek-pouches, in which a superfluity of food can be temporarily stowed away; and the frequently large and brightly coloured callous cushions on their hips, are the most prominent external characters. There is an interesting but quite superficial resemblance or convergence to Carnivores, especially well marked in the mandrill.

Habit.—The baboons are quadrupeds, running swiftly on all fours, climbing with great vigour, fond of sitting on their haunch-pads, and especially at home in mountainous districts. Many of them live in herds, and are therefore formidable both to animals and property. The troops are led by patriachs and guarded by sentinels. They fight with rival herds, and have to withstand the attacks of leopards and other carnivores. Playful and amiable when young, the older forms, and especially the males, are notorious for their evil dispositions, and allow their passions to run riot. The *facile princeps* in iniquity is the mandrill. Those brought home to zoological gardens become specially malicious, the result in part of their sensitiveness to cold, and of the irritations of visitors. They are all clever, dexterous animals, with well-developed brains. Their food varies greatly—fruits, roots, seeds, insects, worms, and many other commodities. The anubis baboon lives principally on the stem and roots of the unique *velwitschia*, so remarkable for its persistent cotyledons, which act as substitutes for the undeveloped foliage leaves.

Different Species.—About a dozen different forms are known. The Baboon proper (*Papio babuin* or *cynocephalus*) is hardly known except in captivity. It is relatively small, with a yellowish-brown hide, long depressed skull, and uncoloured cheeks. It is equally strong and clever, and is often utilised by Arabian and Egyptian conjurers. A near relative is the Sphinx (*P. sphinx*), with only a stump of a tail. The Pig-tailed or Chacma Baboon (*P. porcarius*) occurs in troops in South Africa. Its fur and

Sacred Baboon (*Papio hamadryas*).

medium-sized tail are almost black; the muzzle is very long; the colour of the naked parts of the skin is violet-blue; the ridges above the eyes are very prominent, and the eye-sockets are curiously separated by an upright ridge of bone; the upper canine teeth are extraordinarily long. The Sacred Baboon

(*P. hamadryas*), frequenting the Abyssinian highlands, stands about 4 feet high, is of a light-gray and dusky-brown colour, with a naked flesh-coloured face and a much-compressed ugly skull. Formerly sacred to Thoth, and typical of learning, the hamadryads have sunk in modern Egypt to a subordinate position as luxurious curiosities. They are sometimes caught by being intoxicated with liquor purposely exposed near their haunts, fondness for stimulants being one of their often observed vices. Their bold plundering habits not infrequently lead them into collision with natives and travellers. The Anubis Baboon (*P. anubis*), with various subspecies, ranges from Egypt all through tropical Africa. It often does much damage by descending

The Mandrill (*Papio maimon*).

for midnight ravages among the Indian corn plantations. It was tamed by the ancient Egyptians. The Mandrill (*P. maimon* or *mormon*), with its short tail-stump, its enormous, brightly coloured cheek-swelling, its bushy crown of hair, pig-like snout, 'beetled' brows, sunken eyes, immense canines, and decorated posteriors, is well known as a voracious and passionate animal. The colour and other striking features are in part secondary sex-characters, being more marked in the males, and apparently attractive to the less brightly coloured females. The Drill (*P. leucophaeus*) is a smaller form, with less striking colouring and ugliness; it frequents rocks and plains on the Guinea coast. A good account of baboons is given by Professor Martin Duncan in Cassell's *Natural History*, vol. i. See H. O. Forbes, *Handbook of the Primates*; and MONKEYS.

Babrius, a Greek fabulist, of whom nothing is known, his very date having been put variously from the Alexandrian age to the middle of the 3d century of our era, though the latter is disproved by a 2d century papyrus fragment. He made a considerable collection of Æsopic fables (see *Æsor*), which he turned into choliambic verse, in a natural and popular style. Several prose versions and transformations of these were made during the middle ages, and have come down to us under the name of *Æsop's Fables*. Bentley was the first to recognise in these so-called prose fables of Æsop traces of versification showing the original work of Babrius. A few fables were added from manuscripts by Furia, Korais, and Schneider, and all that was known at the time was collected by Knoche (Halle, 1835). At last, in 1842, a Greek of the name of Minoides Minas, employed by the French government to explore the convents of the East, discovered at Mount Athos a manuscript with 123 hitherto unknown fables of Babrius,

a copy of which he made and brought to Paris, where they were published in 1844. In 1857 he found 95 fables more, the authenticity of which, however, was denied by Conington, Cobet, and other scholars; these, though included by Bergk in his *Anthologia Græca*, are now almost universally recognised as forgeries. Knöbl discovered a number of new fables in the Vatican library in 1877, and Assendelft others at Palmyra in 1891.

See the editions by Lachmann (1845), Rutherford (1883), and Crusius (Leipzig, 1897); the translation by Davies (1860); a Latin dissertation by Christofferson (1901); and the article *FABLE*, with other articles there cited.

Babu, or **BABOO** (Hindi, *Bābū*), properly a term of respect, like Master or Mr, in this sense now used only in Lower Bengal. Anglo-Indians often understand it as meaning a superficially cultivated Bengali; and it often means neither more nor less than 'a native clerk who writes English.' English so written, more copious than correct, and delighting in long and learned words often most ingeniously misapplied, is known as Baboo-English. See *BABA*.

Baby. For the law as to children, the feeding of infants, &c., see *INFANT*, *INFANTICIDE*.—**BABY-FARMING** is an opprobrious name invented for the taking in of children to be nursed for payment, with the implication that much more regard is had to the convenience of the parents and the pecuniary advantage of the receiver than to the well-being of the infants. In 1871 the scandals connected with the 'farming' of babies for one sum paid down, no further charge being taken by the parents and no further questions asked, led to the suspicion that, especially in the case of illegitimate children, an early death was desired, or perhaps directly brought about. That shameful neglect was common, and proper nursing very rare, was made evident; and that actual murder was not very rare was proved in several trials. The mortality among such children was appalling. A select committee of the House of Commons made a very strong report in this sense in 1871; and an act of parliament in 1872 insisted on registration and licenses for houses where children were taken in, made strict regulations, and allotted punishment of offences up to six months' imprisonment with hard labour. A committee of the House of Lords in 1896 to inquire into the working of the act led to its repeal and the enactment of the Infant Life Protection Act of 1897; which again was amended and superseded by the Children Act of 1908. Most of the United States deal stringently with baby-farming.

Babylon, the great city on the Euphrates, was the chief town of Babylonia (q.v.).—Babylon was also the name of a fortress in Lower Egypt, on the right bank of the Nile, opposite the pyramids of Gizeh, and so in what was afterwards Old Cairo (q.v.). Its origin was ascribed to Babylonian deserters, but it first became an important place under the Romans.—'Babylon' in the Book of Revelation, which was to be punished for its sins, and specially its persecutions, is generally identified with Rome. The 'Babylon' of 1 Peter was probably Rome, though possibly Babylon on the Euphrates.

Babylon, a village in Suffolk county, New York, on Great South Bay, and 37 miles E. of New York city, is a summer resort; pop 2500.

Babylonia (*Babīlu* in the Assyrian inscriptions, *Babirush* in the Persian) was the name given to the low alluvial plain watered by the lower streams of the Tigris and Euphrates, now forming the modern Arab province of Irak-Arabi. In the Old Testament it bears the various names of *Kasdim*, 'the land of the Chaldees,' *Shinar*, and *Babel*. Its northern boundary, starting from the region of Naharaim or Mesopotamia, was formed

partly by the Euphrates and its tributaries, but chiefly by a line of forts and frontier stations established by mutual arrangement between the Assyrian and Babylonian kings at various periods, this being probably the Median Wall of the classical writers. On the east the Tigris formed the natural boundary, but some portions east of that river and south of the Lower Zab at times were included in the Chaldean empire. The western boundary was the Euphrates, or rather the desert to the west of that stream, for from the earliest period the fertile fringe of land along the river's bank in the neighbourhood of Uī (Mugheir) and Borsippa (*Burs-u-Nmru*d) was under Babylonian rule. The southern limit was the shore of the Persian Gulf, the waters of which then extended considerably farther inland, the two rivers as late as the time of Sennacherib, 705 B.C., entering the sea by separate mouths. The country has from all time been one of the most fertile spots in the whole of Western Asia, and famed for its rich corn-producing qualities. Indeed, Herodotus says that it supplied one-third of the corn produced by the whole Persian empire. The inscriptions afford ample confirmation of this fact, the tithe receipts of the temples showing an enormous yield of cereals. This natural fertility was greatly aided by the splendid system of artificial irrigation through a network of canals spread all over the country, many of which are navigable to the present day. The most important of these was the Nahr Malka, which was serviceable as late as the 7th century A.D., and only disused when allowed to fall into decay after the Mohammedan conquest. This important artery joined the Tigris and Euphrates in North Babylonia, passing through the ancient cities of Sippara or Sepharvaim and Akkad, and entering the Tigris about 30 miles below Bagdad. The lines of its course are marked by the modern Yusifeh and Amran canals. This canal was probably excavated by Khammu-rabi in the 21st century B.C. Other important inland waterways were the Nar Kuti or river of Kutha, the modern Hables-Sook, which passed through almost the whole length of Central Babylonia; and the Naru Essu or new river, a large canal in the neighbourhood of Babylon excavated by order of Nebuchadrezzar II. (605 B.C.). At an early date Babylonia was divided into Akkad or Northern Babylonia, and Sumer, usually identified with the biblical Shinar, or Southern Babylonia. Akkad, which took its name from the city of Akkad, near Sippara, was the first to be occupied by the Semites and to be the seat of a Semitic kingdom; Sumer, on the other hand, long remained in the possession of the older Sumerian population, and continued to the last to be less Semitic than its northern neighbour. Among its cities were Erech (an early Semitic capital), Kis, Sippara ('the city of the sun-god,' now *Abu Hadda*), Opis, Babylon, and Nippur. Lagas, Larsa, Eridu, the ancient seaport of the country, and Ur (on the western side of the Euphrates) were in Sumer. In the Kassite period Northern Babylonia was known as Kar-Duniyas, 'the Wall of the god Duniyas.' In contradistinction to the desert, the Babylonian plain was called by the Sumerians Edina, 'the land of Eden' of the Old Testament. The marsh-lands in the south, 'the land of the sea,' through which the great 'salt river' passed, and which bordered on the Persian Gulf, were inhabited by Aramæan tribes called Kaldā or Chaldeans by the Assyrians.

The summer climate is exceedingly hot, and rain prevails from December to January. The natural products of the land were almost unbounded—corn and many other cereals, sesame, cucumbers, melons, vines, and, above all, the date-palm, which afforded wood, fibre for ropes, fruit, and wine. Stone and minerals are practically unknown; hence Babylonia

was the home of brick architecture, the bricks being baked in the sun. Asphalt was used as mortar, and the houses were roofed with reeds.

Lions, panthers, jackals, and wild boars were numerous; oxen, sheep, and goats were still more so. Large flocks of sheep were tended in the desert by the Bedouins for their Babylonian masters, and the wool yielded by them was one of the chief articles of Babylonian trade. The dog was domesticated; so also was the ass; the horse and camel were later introductions, the horse not making its appearance before the age of Khammu-rabi.

Ethnology.—Babylonia, according to both sacred and classical writers, has always been a land of mixed races and languages, and its polyglot and heterogeneous character is shown by the monuments to have existed from remote antiquity. The inscriptions have revealed the fact that its earliest inhabitants, who drained the marshes, trained the rivers, built the cities, and invented the cuneiform system of writing, spoke an agglutinative language—that is to say, a language of the same type as those of the Turks or Finns. The sculptures show them to have been beardless and round-faced, with high cheek-bones, the physical type being like that of the primitive non-Semitic population of Elam. The original home of the Sumerians, as they are now called, is a matter of dispute. The Semites entered the country at an early date, and established themselves in Northern Babylonia or Akkad, where the first Semitic empire—that of Sargon—arose; the inhabitants of Sumer or Southern Babylonia retained their non-Semitic characteristics to the last. The marsh-lands, south of Sumer, however, were occupied by Aramæan tribes of Semitic descent, the Chaldeans of the classical writers. About 1700 B.C. non-Semitic mountaineers from the East, known as the Kassî or Kossæans, conquered Babylonia, and introduced a new racial element into the country; while in later times Kurds, proto-Armenians, and Hittites, as well as Elamites, were to be found there. The Semites, having once obtained a footing in Babylonia, adopted and adapted the more advanced culture of their Sumerian masters. They borrowed the cuneiform writing, the religion, mythology, and much of the science of that inventive people, and so rapidly increased in numbers and power that as early as about 3800 B.C. we find a dynasty of Semitic kings, under Sargon of Akkad and his son Naram-Sîn, ruling in North Babylonia.

Chronology.—For Babylonian chronology we have to depend in the first instance on notices in the Old Testament, the quotations in Josephus, Eusebius, and Africanus from the lost history of Berossus, a Chaldean priest who wrote in Greek about 270 B.C., and, above all, the list of Babylonian kings from Nabonassar (747 B.C.) appended to the tables of the eclipses of the sun and moon compiled by Claudius Ptolemæus in the 2d century A.D. The list of dynasties which George Syncellus professes to have extracted from Berossus is of uncertain authority. The native tablets have given us dynastic lists of kings with the duration of their reigns, a series of chronicles, a 'synchronous' history of Babylonia and Assyria, references in later texts to earlier events, and multitudes of dated legal and commercial tablets beginning about 2500 B.C., and coming down to the Parthian era. The years were named after the chief event or events which characterised them, among which the death or accession of a king was necessarily the most important; and the fact that Babylonia was a commercial community made a system of accurate dating indispensable.

Domestic and Social Life.—The recovery from the libraries of Babylonia of many thousands of inscribed tablets relating to almost every phase of

private daily life affords us an insight into the sociology of this ancient empire far more clear than that provided by the records of any other primitive kingdom, excepting perhaps the sister-kingdom of Egypt. The child, immediately after birth, was sealed with the sign of sonship, which was confirmed by witnesses; adoption was very frequent. On reaching the age of puberty, the youth was admitted to his portion as a free-born citizen, and his freedom attested to him. The Babylonian legal tablets relating to the laws of marriage do not confirm the statements of Herodotus. The dowry of the woman was secured to her, and was returnable in case of divorce, while marriage was attended by both a religious and civil ceremony. Women, especially married women, occupied an exceptionally favourable position in Babylonia. Offences against the mother were punishable by mutilation and deprivation of civic rights. Women could trade and own slaves and other property in their own right. Like the men, they were educated and taught tablet-writing. Slaves were protected from cruel treatment, and if injured, had to be supported by their masters. They could own land, and, if able, maintain themselves. Slaves were often apprenticed to learn trades by their masters.

The laws were administered by regular appointed judges, who sat either in the gates of the temple or in the great gate of the city. The supreme judges were called 'the judges of the king.' The decisions were all governed by certain precedents, many of great antiquity, which were drawn up and carefully preserved. The chief punishments were fines, imprisonment, deprivation of civic rights, and in some cases death; and the right of appeal to the king could be claimed. About 2000 B.C. the laws of the country were all codified by Khammu-rabi or Amraphel, and a copy of the Code (q.v.), the oldest in existence, has come down to us. The revenues were derived from a fixed tariff of taxes. The chief taxes were the 'king's tax,' apparently a tithe on all property, the army tax, and the dues levied on certain districts for ships. The local taxes were the temple tithes, called *tentils* (*esritum*), the first-fruit tax, the corn and date and sheep tax, and the road and canal dues. Numerous documents relating to these dues are now in the British Museum collection. The temples had rich estates attached to them like the modern Arab Wakf lands, which were farmed or leased. The transfer of land was regulated by fixed laws, and leases had in many cases carefully drawn plans of the estates attached to them. The standard currency was a silver one, the units being the talent, maneh, shekel, and pari. Coined money was probably introduced in the reign of Darius.

Law and the Code of Khammu-rabi.—Babylonia was from the earliest times a great commercial community, and law therefore soon attained a great development in it. Like English law, it was 'case-made'; that is to say, it consisted of the decisions pronounced by the judges in individual cases. These decisions were founded upon precedents, and were given after witnesses had been sworn and heard upon both sides, and were then duly registered by the official clerks. Women as well as men could act both as witnesses and as parties to a suit. The earliest laws were necessarily in Sumerian, and Sumerian long continued to be the language of the courts, like Norman-French in England. Gradually Semitic Babylonian took the place of Sumerian, though many of the technical words and phrases remained Sumerian. From time to time certain groups of laws were codified, but it was not until the reign of Khammu-rabi that a code embodying the whole of Babylonian law

was compiled. It was one of the first results of the king's unification of Babylonia and its empire, and of an attempt to weld together the various races in it. Copies of the code were sent to different parts of the empire; one of these was discovered by M. de Morgan at Susa in 1902, and is now in the Louvre. The civil wars that had recently devastated Babylonia had led to a large amount of brigandage; hence the Draconian character of much of the legislation. The distinguishing feature of the legislation, however, is its consideration for the rights of property, property being regarded as of more value than the life of the individual. This care for the rights of property, natural in a trading community, offers a marked contrast to the provisions of the Mosaic Law, which was made for a body of nomads. The individual is forbidden to take the law into his own hands, the right of blood-revenge not being recognised except in two instances, when a brigand is caught red-handed, or when a man is found robbing the house of a neighbour which has been set on fire. In this, again, we have a contrast to the Mosaic Law. Another characteristic of the code are the laws relating to inheritance. The father (or even mother) could make a will, and leave property to a 'favourite son' over and above what legally came to him after his father's death. Children, moreover, could be adopted, and a slave who was thus adopted obtained all the rights of the free man. Of this there is no trace in the Mosaic Law. The Book of Genesis, however, contains references to usages which show that in the patriarchal age the Babylonian Code was observed in Canaan as in other parts of the Babylonian empire. The conduct of Sarah and Abraham towards Hagar and her son is explained by the laws that the wife could present her husband with a concubine, and if she had had no children the husband could take a second and inferior wife, while the mistress is forbidden to sell the concubine if 'she has a dispute with her mistress because she (i.e. the concubine) has borne a child to the husband.' The adoption of Eliezer by Abraham was similarly in accordance with the Babylonian law; so, too, was the purchase of the field and cave of Machpelah with Babylonian shekels (*sikli*), and the threat of Judah that he would punish his daughter-in-law, whom he supposed to be a widow, with death by burning. This was the punishment enacted against a nun who was unfaithful to her vows of virginity or widowhood.

The code is a purely civil one. Beyond the fact that all legislation was believed to have been inspired by the sun-god, there is no allusion to religious sanctions. Owing to its 'case-made' origin, the individual laws begin with the formula 'If.' It is the same with the civil laws of the Mosaic Code (Exodus xxi., xxii.), which had a similar 'case-made' origin (Exodus xviii. 25, 26). Some of these resemble the enactments of the Babylonian Code. Thus the Code of Khammurabi lays down that a man who has been enslaved for debt should regain his freedom after three years, that a fine should be inflicted for pasturing cattle in another man's field, that the defaulter who had betrayed his trust should pay back double, that the owner of cattle which had been lost or stolen through neglect could claim restitution, and that the receiver of bribes should be severely punished.

Among other regulations of the code are some relating to taverns and their keepers, and to surgeons and veterinaries. 'If a surgeon performs a serious operation on a man with a bronze lancet and the man recovers from a tumour or a disease of the eye, the surgeon shall receive ten shekels of silver. If the operation has been performed on a

poor man, he shall receive five shekels of silver. If the operation has been performed upon a slave, the slave's master shall pay two shekels of silver. But if after the operation the man dies through cutting open the tumour or the destruction of the eye, the surgeon's hands shall be cut off. . . . If a veterinary has performed an operation on an ox or ass and has cured it, the owner shall pay him the sixth part of a shekel. If the animal dies, he must pay the owner a fourth part of its value.'

Art and Manufactures.—Babylonian art was until recently represented by a few engraved cylinders and gems; but the excavations at Tello, Abu-Habba, and elsewhere have now brought to light statues which are really good works of art,

Fig. 1. Chaldean Cylinder, Marble or Porphyry (New York Museum).

and differ from the later works of the Assyrian artists. One of the largest of these statues is nearly life-size, and represents the 'high-priest' Gudea, the viceroy of Lagas, seated on his throne; the statue is extremely accurate in its anatomy, and carved in the hardest green diorite. The whole of the group is covered with a long inscription in archaic characters, recording the restoration of various temples by this prince about 2500 B.C. Still more remarkable is a fine head carved in red porphyry, which clearly bears the appearance of being a portrait, and is true to the facial characteristics of the Sumerian race. The execution of these works of art indicates that the art of sculpture had been long practised, and that tools of the most perfect temper must have been used. Along with the stone statues were found several bronze statuettes showing a knowledge of the art of casting metals. Gem-engraving had always been a special feature of Babylonian art, and numerous hard stone seals have been found, the intaglio workmanship of which shows a high development of the lapidary's art. The subjects upon these are taken from the legend of Gilgames, or from other popular myths; others, again, relate to the future life. Talismanic gems bearing emblems of the gods and magical formulæ are also frequently found. The stones chiefly selected by the Babylonian lapidaries were hæmatite, green and red jasper, cornelian, chalcedony, crystal, lapis-lazuli, onyx, and saïdonyx. Music formed an important feature both in the court and religious ceremonies of the Babylonians at an early period, and on the sculptures we find harp, pipe, and cymbals represented. Among the trades mentioned in the tablets are those of weaver, dyer, potter, smith, builder, and carpenter.

The classic writers also represent the civilisation of the ancient Babylonians as of a high stamp. Arts and commerce were highly flourishing—the last was carried on by caravans with Bactria, Persia, and Media, perhaps as far as India, and by shipping on the Persian Gulf with Arabia. Babylonia was famous for its dyes, its cloths, and embroidery, especially for the manufacture of rich carpets with inwoven figures of strange animals and arabesques, such as we yet see in the Nineveh sculp-

tures. The general prosperity was such that Babylonia and Assyria together were able to pay to Persia, under Darius Hystaspis, a yearly tribute of 1000 talents (upwards of £280,000)—a sum greater than that contributed by any other province.

History.—The French excavations at Tello, the ancient Lagas, and those of the Americans at Niffer, the ancient Nippur, have enabled us to reconstruct the outlines of early Babylonian history. It begins with a number of small independent states—all of

Fig. 2. Inscription upon the Sargon stele.

them Sumerian, and for the most part mutually hostile. At an early date, however, the Semites entered the country, and, after adopting the culture and script of the Sumerians, established principalities of their own. Among these were the kingdoms of Kis and Erech. Whether a certain king of Erech, however, whose name has been read Lugal-zag-gisi, and who founded the first Babylonian empire, is to be accounted a Semite is doubtful. He was more probably of Sumerian origin. Ur, Larsa, and Nippur were included in his kingdom, and he claims to have extended his rule from the Mediterranean to the Persian Gulf. The excavations of the French-

men De Saizac and Cios have made us better acquainted with the history of another Babylonian city, Lagas (*Tello*); but the authority of the early Sumerian kings of Tello was limited to Southern Babylonia. It was otherwise with the Semitic dynasty of Sargon of Akkad and his son Naram-Sin, whose date is fixed by the royal antiquarian Nabonidos at 3800 B.C. They not only established their power over all Babylonia, but created an empire which stretched from Susa on the east to the Mediterranean on the west. Three campaigns were needed before 'the land of the Amorites'—i.e. Syria and Palestine—could be subdued and welded with Mesopotamia, Babylonia, and Elam into 'a single' empire. Naram-Sin added Magan, the Sinaitic peninsula, to his father's conquests; there is a portrait of him on a monument discovered at Diarbekr. The empire of Sargon and Naram-Sin soon broke up, and was followed by a long period of inaction, during which we must place the reign of the Semitic king Manistusu, an important monument of whom, throwing light on the economical condition of Babylonia, has been discovered at Susa. Eventually a Sumerian dynasty arose at Ur, which united Babylonia under one rule, planted colonies in Cappadocia, and carried on campaigns in the Lebanon. Its first kings, Ur-Gur and Dungi, were great builders. One of their viceroys was Gudea, the high-priest of Lagas, of whom we possess many inscriptions. Cedar was brought for his buildings from the Gulf of Antioch, stone from Lebanon, copper from Sinai, gold from Northern Arabia. The last king of the dynasty of Ur perished in battle against Elamite rebels, and civil wars, followed by foreign invasion, devastated Babylonia. Eventually Northern Babylonia was conquered by the Amorite, Samu-abi ('Shem is my father'), while Southern Babylonia fell into the hands of the Elamites, who made Larsa their capital, Babylon taking the same position in Northern Babylonia. The fifth king of the Amorite dynasty seems to have been overthrown by the Elamites; Babylon was captured by its Elamite foes; and his son, Khammu-rabi or Ammurapi, the Amraphel of Genesis xiv., who was a mere boy, was placed on the throne as the vassal of the Elamite king (about 2000 B.C.). After thirty years of subjection, Khammu-rabi recovered

his independence; the Elamites were defeated in battle; and Larsa, the capital of their representative, Eri-Aku or Arioch, in Southern Babylonia, was taken by storm. Khammu-rabi was now sole master of Babylonia and its empire, which included Syria and Palestine, and he proceeded to clear the country of brigandage and to compile an elaborate code of laws. Canals were dug or reopened, and the temples and cities of Babylonia were restored.

Samsu-satana, the fifth successor of Khammu-rabi, was the last king of the dynasty. Its fall was probably occasioned by an invasion of Babylonia by the Hittites. For a time the Aramæans from the coast-lands of the Persian Gulf governed Babylon; then came an invasion of wild Kassites, under Gandia, from the eastern mountains, and for 576½ years Babylonia was ruled by a Kassite dynasty. In course of time the invaders adopted the culture and language of Babylonia; but the empire in the west was lost, never to be regained, while Assyria became an independent kingdom. About 1400 B.C. we find the kings Kadasman-khadas and Burnaburyas II. engaged in correspondence with the Pharaohs of Egypt. Meanwhile there was frequent war with Assyria, which lost no opportunity of interfering in Babylonian affairs; and eventually Babylon was captured by the Assyrian king Tukulti-Ninip, its king, Kastilias, was slain, and for seven years Babylonia was ruled by an Assyrian sovereign. Then the Babylonians recovered their independence, and eight more Kassite

princes sat on the Babylonian throne. The last of them was overthrown by the Elamites about 1180 B.C., and a dynasty of native Babylonian kings followed. The most famous of these was Nebuchadnezzar I., who has left us a graphic account of his invasion of Elam and Kurdistan. Towards the end of his reign, however, he suffered defeat at the hands of the Assyrians. The dynasties which followed were short-lived; and then came another native line of kings (about 1000 B.C.), the first of whom, Nabumukinpal, reigned thirty-six years. One of his successors, Nabu-nazir (747–734 B.C.), is the Nabonassar of classical writers, with whom the Ptolemaic canon

begins. Five years after his death Babylonia was conquered by the Assyrian king Tiglath-pileser IV., who, under his original name of Pul or Pul, was crowned at Babylon 729 B.C. This conquest of Babylonia was very important, as it once more unified the two kingdoms on the banks of the Tigris and Euphrates. When the Assyrian throne was seized by Sargon in 722 B.C., after the death of Shalmaneser IV. (known as Ulûlâ in Babylonia), the Babylonians revolted, and under Merodach-

Fig. 3. King Merodach-nadin-akhi. (From a Basalt Stele in the British Museum, about the 12th century B.C.)

baladan, the Chaldean from the marsh-lands of the Persian Gulf, maintained their independence for twelve years. In 710 B.C., however, Merodach-baladan was crushed, in spite of his alliance with Hezekiah and other western princes, and Babylon again became Assyrian. After the assassination of Sargon in 705 B.C. Merodach-baladan returned, but after a reign of nine months was driven out by Sennacheib and forced to find a refuge in the Elamite provinces on the eastern shore of the Persian Gulf. For some years Babylonia was governed by Assyrian viceroys or by native princes who had Elamite support; the battle of Khalulê, however, in 691 B.C., broke up the resistance to Assyria, and two years later Babylon was taken and razed to the ground. It was rebuilt by Esar-haddon, on whose death in 668 B.C. Samas-sum-yukin, the twin-brother of Assu-bani-pal, called Saosduchinos by the Greeks, was appointed viceroy. He headed the great revolt against Assyria, which ended in the devastation of Babylonia and the capture of Babylon, where Samas-sum-yukin burned himself in his palace in 648 B.C. The next Babylonian viceroy, Kandalanu, died in 625 B.C., and was succeeded by Nabu-pal-uzur (Nabopolassar), who, with the assistance of Cyaxares of Ecbatana, revolted from Assyria and made himself independent king of Babylonia, 606 B.C. He died two years later, while his son, Nebuchadrezzar II. (Nabu-kudur-uzur) was engaged in driving the Egyptians from Syria and Palestine. (In *Nebuchadrezzar* in 2 Kings xxiv., xxv., &c., *n* is a text-corruption. See Jer. xxxix.)

Nebuchadrezzar II. was one of the greatest of the Babylonian sovereigns. During his long reign of forty-three years he restored the ancient Babylonian empire in the west, rebuilt Babylon, and covered Babylonia with temples, fortifications, and canals. In 599 B.C. he took Jerusalem, sending Jehoiakim captive to Babylon; and eleven years later (588 B.C.) he destroyed the city with its temple, and removed most of the inhabitants to Chaldea. In 568 B.C. he made a successful campaign in the Egyptian Delta. In 561 B.C. he was succeeded by his son Evil-Merodach, who released Jehoiakim, but was murdered (in 559 B.C.) by his brother-in-law Nergal-sharezer or Neriglissor, the Rab-Mag (probably the Rab-mugi of the Babylonian texts). His reign lasted till 556 B.C., his son, Labasi-Marduk or Laborosoarchod, only ruling a few months, when the throne was usurped by a nominee of the Babylonian priests, Nabonidos (Nabu-naid). Nabonidos was an antiquarian rather than an administrator, the command of the army and the active government of the country being handed over to his son, Bil-sar-uzur, the Belshazzar of the Book of Daniel. He restored the great temple of the moon-god at Harran in Mesopotamia which had been destroyed by the 'Manda' of Ecbatana, as well as the ancient temples of Sippara, Larsa, and Ur, excavations being undertaken to discover the original records of their construction and to trace their history. In his sixth year, 549 B.C., came the overthrow of Astyages (Istuvegu) of Ecbatana by Cyrus (Kuras), king of Anzan in Elam. Later on in his reign his attempts to centralise the religious worship of the country at Babylon led to the growth of a disaffected party; the members of this party intrigued with Cyrus, who meanwhile had become king of Persia. In 539 B.C. the coast-land revolted, and Cyrus invaded Babylonia from the north. The Babylonian army was defeated at Opis, and a few days later, on the 14th Tammuz (June), Sippara was taken without fighting. Nabonidos fled and concealed himself in Babylon, followed by Gobryas, the governor of Kurdistan, with the army of Cyrus. On the 16th Gobryas entered Babylon without resistance, and Nabonidos was captured. The

daily services went on as usual in the temples, and the contract-tablets show that there was no disturbance of trade. On the 3d of Marchesvan (October) Cyrus came to Babylon and proclaimed a general amnesty, Gobryas being appointed governor of the city. The foreign exiles in Babylonia were allowed to return to their native lands, taking with them the images and sacred vessels of their gods. After the death of Cambyses (521 B.C.) Babylon revolted under Nidinti-Bel, who claimed to be Nebuchadrezzar, son of Nabonidos. Three years were needed before the rebel city could be taken by the Persian army of Darius Hystaspis. In 513 B.C. it revolted again under a certain Arakha, but this second revolt was soon suppressed.

With the overthrow of the Persian monarchy, Babylonia came under the short-lived dominion of Alexander the Great, who died in that city (323 B.C.). Seleucus I., to whom it had been promised at the conference of Triparadisus, contested and won the possession of it from Antigonus (312 B.C.). About 140 B.C. it was taken from the Syrian monarchs by the Parthians. It came into the hands of the Romans only temporarily, first under Trajan (114 A.D.), under Septimius Severus (199 A.D.), and again, under Julian (363 A.D.). When in 650 the successors of Mohammed put an end to the new Persian monarchy of the Sassanids, the province of Babylonia, where Bagdad was built (762-766), became the seat of the khalifs till 1258. From 1638, when the Turks, for the second time, took it from the Persians, till the Great War, it was under the dominion of Turkey, divided into the pashalics of Bagdad and Basra. See MESOPOTAMIA.

Language and Literature.—The language of the Sumerians was agglutinative like that of the Turks. The script was originally pictorial; when, however, clay was introduced as the writing material it passed into the cursive form known as cuneiform or 'wedge-shaped,' and many of the ideographs or pictures of ideas became purely phonetic (see the article CUNEIFORM; also WRITING). After the occupation of Northern Babylonia by the Semites and the adoption by them of the Sumerian culture and script, the phonetic character of the script was largely developed, the Sumerian words expressive of ideas becoming mere phonetic symbols. The older Sumerian literature was now translated into Semitic Babylonian or provided with Semitic translations; and grammars, dictionaries, reading-books, and commentaries were compiled to facilitate the study of the older literature. Up to the last both religion and law continued to make extensive use of the extinct language of Babylonia, which was to the ancient East what Latin was to medieval Europe. In course of time, however, an independent Semitic literature arose; a considerable proportion of the epics, for example, were written from the first in Semitic Babylonian. Texts were also written by the Semitic scribes in what was now the dead Sumerian, the results sometimes reminding us of modern 'dog-Latin.'

Education was widely extended, even women and artisans taking part in the voluminous correspondence that has come down to us (see above, *Domestic Life*). Schools and libraries existed in the towns, the collections of books being numbered and arranged on shelves. The libraries were provided with catalogues, and were under the charge of librarians. Different libraries naturally had their special classes of literature. At the old seaport of Eridu, for instance, the temple of Ea, the Babylonian god of culture, possessed copies of a particular ritual with hymns to the gods, as well as a series of works containing spells for driving away disease. Larsa had its hymns to the sun-god, Ur its hymns to the moon-god. One of the most interesting collections is the series of exorcisms

called *surpu*, in which the priest, before granting absolution to the penitent, requires him to confess the sins of which he has been guilty. 'Has he set his parents or relations at variance; has he spoken evil of his father or mother; has he lied, stolen, dishonoured his neighbour's wife, or committed murder?' are among the questions put to him.

The epics constituted an important section of the literature. Chief among them is the Epic of Gilgames in twelve books, largely compiled out of older materials. Gilgames was half-mortal, half-divine; after delivering Erech from its enemies he was wooed in vain by the goddess Ishtar, who by way of revenge sent a mighty bull to ravage the land. The hero and his friend, the satyr Engidu, slew the bull; but the gods in return caused Engidu to die, while Gilgames himself was smitten with disease. Gilgames then wandered beyond the gates of the sun and the waters of death in search of Ut-napisti, the Babylonian Noah, who had been translated after the Deluge without dying, and from whom he hoped to learn the secret of escaping death. In the eleventh book of the epic Ut-napisti recounts the story of the Deluge, which closely resembles that in Genesis, and bids Gilgames gather a particular plant which will ensure his immortality. On his way home, however, a serpent

after god declined to pursue him until Lugal-banda at last overreached him in the mountains of Sabu. Another epic describes the devastating career of Uta the plague-god, who punished mankind for their sins.

Among other contents of the Babylonian libraries may be mentioned historical documents, copies of letters, astronomical, astological, mathematical, and medical works, omen-texts, and lists of countries, cities, and gods. School exercises have come from the schools attached to the libraries and temples, while there were archive-chambers filled with official documents as well as vast collections of legal and commercial tablets.

Religion.—During the long period over which the monuments and inscriptions extend, numerous changes took place in the religion of Babylonia. Sumerian religion can be traced back to a sort of Shamanism, according to which every object in nature was regarded as the abode of an indwelling spirit or life (*Zi*), which controlled its actions and its relationship to man. Round this primitive creed grew up a body, not of priests, but rather of medicine-men or exorcists, who dealt mainly with the malevolent spirits of disease and the hostile powers of nature injurious to the life of man.

The liturgy of these priests is found in the magical texts, large numbers of which have been preserved in the libraries of Nineveh and Babylonia. Gradually the vast host of spirits became grouped in a hierarchy of the spirits of the heavens and the earth; and from these came the first gods of the Sumerian pantheon. Under this new development a number of local gods grew up, and each city had its divine patron, who was worshipped there in a strictly henotheistic form—that is, he alone in his sacred city was supreme among the gods. Thus, in a beautiful litany from Ur of the Chaldees, it is said of the moon-god, 'In heaven who is supreme? Thou alone art supreme! On earth who is supreme? Thou alone art supreme!' Similar words are found in the local hymns to Merodach in Babylon, and to Nebo in Borsippa. One of the earliest seats of religious culture in Chaldea appears to have been the city of Eridu, then on the shore of the Persian Gulf, where was the seat of Ea, the culture-god of Babylonia, who presided over the water and had his home

Fig. 4.—Upper half of 'Sun-god Tablet'—priests and king adoring the sun's disc (British Museum).

carried away the plant, and the hero was made to understand that death must be the lot of every man. The same lesson is inculcated in the Epic of Adamu, the first man, who was created by Ea at Eridu. Adamu broke the wings of the south wind, and was accordingly summoned to appear before the court of the gods. Here he refused 'the food of life,' fearing that it was 'the food of death,' and thereby, along with his descendants, lost the gift of immortality. The Epic of Etana describes how the first king endeavoured to obtain the insignia of sovereignty by mounting to the sky on the back of an eagle; after reaching the heaven of Anu, however, he fell to the ground while attempting to ascend to the gate of Ishtar, and was dashed to pieces, while the eagle was destroyed by a serpent whose young it had devoured. The legend of the god Zu (the storm-demon) tells how he stole the tablets of destiny from Bel, and how god

in the sea. Among other titles he is called 'lord of wisdom,' 'he who knows all things,' 'the lord of revelation.' He was, in fact, the fish-divinity, termed Oannes by Berossus, who taught the elements of culture to the first inhabitants of Chaldea. The consort of Ea was Dav-kina, 'the lady of the earth,' who personified the earth just as Ea represented the sea. Water and the earth were, according to the ancient theogony of the city of Eridu, the two elements out of which all the world proceeded. This pair had a son, Tammuz, 'the only begotten one,' who, in the creed of Babylon, was replaced by Marduk or Merodach. The worship of Tammuz in association with his consort Ishtar reached a high development in Babylonia, and spread over the whole of Western Asia. Next in importance among the local deities came the god Mul-lil or El-lil, the elder Bel of the Semitic creed, whose sacred city was Nippur, the

modern Niffer. This great god, whose name means the 'lord of the ghost-land,' was also the ruler of 'earth and mankind,' and, according to one version of the Deluge legend, was the deity who caused the destruction of the wicked. The mistress of the ghost-land was the goddess Ninkigal or Allat, 'the lady of the great land' of Hades. She was the queen who ruled in the dread 'land of no return,' and 'whose city and palace walls were clothed in dust, the inhabitants thereof weaving robes of feathers like birds.' The messenger of this dread pair was Namtar, the demon of fever and goddess of fate, who spread disease and death abroad. Anu, the god of the sky, the centre of whose worship was at Erech, completed the trinity of the three supreme gods, El-lil, Ea, and Anu. Below them came another trinity, that of the moon-god, the sun-god, and Istar, the evening star. The moon-god, worshipped at Ur, under the name of Nannar, took precedence of the sun-god. At Sippara and Larsa, however, Samas, the sun-god, became the head of a special cult which absorbed many of the other older gods, and each city had its local sun-god or solar hero. In Southern Babylonia Larsa was the chief seat of solar worship. It was, however, in the northern city of 'Sippara of the sun,' and in the most ancient temple of E-Babara, 'the house of lustre,' that it attained to its highest development. The tablet of which a representation is given (fig. 4) was erected by Nebobaladan, king of Babylon, an ardent votary of the worship of the sun-god, about 900 B.C. The god is seated on a square seat, placed inside a porch supported by pillars, and holds in his hand a ring and a short rod. Before the pillar stands a stool with legs, bearing a figure of the disc of the sun, apparently supported by cords which are held in the hands of two attendant spirits from the roof. Of the three figures standing with their faces turned towards the disc, the first is a priest, who holds the stool with his left hand, while with his right he grasps the left hand of the second figure—the king, whose right hand is raised in adoration to the god. The third figure behind the king has both hands raised in adoration. Above the heads of the three figures are three lines of inscription: 'The image of the Sun-god, the mighty lord, the dweller in the temple of Uri, which is within Sippara.' Under the god are carvings of two figures, and above are three circles, representing the new moon, the sun, and Istar or Venus. The inscription below them explains that the canopy over the head of the god, like the rope which caused his disc to revolve, was the divine serpent. The rise and spread of the sun-cult in Babylonia mark a great change in the religious life of Chaldea in the meeting and amalgamation of Semitic and Sumerian religious thought. We have no longer to deal with the dread El-lil of the ghost-land, but with a supreme Baal, the father and creator of the universe, who rapidly absorbed all the other solar deities in the Sumerian pantheon. It is to this age that we must assign the growth and compilation of the great Epic of Gilgames, with its solar setting. This is also the age which witnessed the rise of Babylon as the capital of Babylonia, and therewith of its god Bel-Merodach, who was originally a solar deity, to supremacy over the other gods. The position attained by Merodach in the later days of the Babylonian empire approaches monotheism, and the misfortunes which overtook the country are regarded as punishments inflicted by Merodach upon his people on account of their sins. Merodach's wife was entitled Zirpanit or Zarpanit, who has been identified with the Succoth-benoth of the Old Testament (2 Kings, xvii. 30). The great temple of E-Sagila at Babylon, known

to classical writers as the Tomb of Bel, was dedicated to Merodach. In its court rose the *ziggurat* or 'tower,' on the summit of which was the sanctuary of the god, furnished with a couch and a holy table. The ceremonies of service resembled those of the Jews. The daily sacrifice, the free-will offering, the meat and drink offerings, and the shewbread formed part of the ritual. The messenger and interpreter of Merodach was Nebo, 'the Prophet,' whose temple, now represented by the *Birs-i-Nimrud*, stood at Borsippa, where he was worshipped along with his wife Tasmit, 'the Hearer.' The temple was called E-Zida, 'the House Everlasting,' and the god himself was the patron of books and their writers. Among the other divinities of Babylonia may be mentioned Nin-ib, the messenger of El-lil, originally a sun-god, the reading of whose name, however, is still uncertain; Hadad or Rimmon, 'the Amorite,' who was god of the air; Nergal, the god of the dead, the patron deity of Kutha; Gibil and Nusku, the fire-gods; and the goddesses Beltis (Belit) and Nina. The goddesses, however, were little more than shadowy reflections of their husbands, with the exception of Istar, the Ashtoreth of Canaan, who originally represented the evening star. She was an independent divinity, and presided over love and marriage, and, in Assyria, over war.

The City of Babylon.—Babylon was originally merely a provincial town, and Borsippa, which afterwards became its suburb, seems to have been a more important place. We already hear of Babylon in the time of Sargon of Akkad, but it was not until the rise of the Amorite dynasty of Khammu-rabi that it became the capital of Northern Babylonia. It had probably grown up round the temple of its patron deity Bel-Merodach, which was called E-Sagila, 'the House of the Exalted Head.' The city was known by more than one name, the most common being Babili, 'Gate of the God,' originally applied, it would seem, to the quarter opening on the temple. In Hebrew a punning etymology connected the name with a word which means 'to confound.'

After being ruined by an Elamite invasion, both city and temple were restored by Khammu-rabi. Khammu-rabi's city was that which was razed to the ground by Sennacherib in 689 B.C., the rubbish being thrown into the Arakhu canal. Esar-haddon again restored it, but the Babylon so famous in classical authors was the creation of Nebuchadnezzar II. Recent German excavations have enabled us to fix the main outlines of the topography of this latter town. They have brought to light the channel of the old canals, 'the Gate' and chapel of Istar, and the great processional road, lined on either side with enamelled tiles on which lions and other monsters were represented, which led to the temple of E-Sagila. The double line of city walls, together with the gates, has also been traced. The palace of Nebuchadnezzar is represented by the mound now called El-Qasr.

According to Herodotus, the city stood on both sides of the Euphrates in the form of a square, the length of the sides being 120 stadia, and the whole circumference 60 miles. It was surrounded by a wall 200 cubits high and 50 cubits thick, and pierced with 100—or, according to Diodorus, 250—gates of bronze. At regular intervals were towers. Broad, straight streets crossed one another at right angles, and the banks of the Euphrates were united by a stone bridge. The bed of the river itself was lined with stone, and along its sides ran stone quays. Among the chief wonders of the city were 'the Hanging Gardens' constructed by Nebuchadnezzar for his Median queen. The city suffered greatly in the revolts which followed the Persian conquest, its outer walls being demolished, and the

temple of Merodach being subsequently plundered by Xerxes. Although the Persian kings made Babylon their residence, little was done for its restoration, and Alexander the Great, who, on his entrance into the city in 331 B.C., had promised to rebuild the temple, was unable even to clear away the rubbish, though 10,000 workmen were employed for the purpose during the space of two months. After his death in the palace of Nebuchadnezzar, and the foundation of Seleucia on the Tigris by Seleucus Nicator, Babylon went rapidly to decay. Stone had to be brought to Babylonia from other countries, and consequently stone buildings there which had ceased to be used became quarries out of which newer edifices were constructed, while the bricks which were ordinarily employed soon disintegrated. In the time of Pausanias there was little to be seen on the site of Babylon except the ruins of walls, and Rich was the first modern traveller to examine it scientifically. The Buis-i-Ninnud represents the temple of Nebo at Borsippa, and had nothing to do with Babel (q.v.) or Babylon.

Babylonish Captivity, the deportation, under Nebuchadnezzar, of a large portion of the principal inhabitants of Judah, after the fall of the city of Jerusalem in 586 B.C. A large number of the inhabitants of Judah had been already carried off to Babylon in 597, when Zedekiah had become king over the remainder. It was not long before these excited the anger of the powerful Chaldean king, and the second capture of the city and captivity of the inhabitants put an end to the kingdom of Judah. They were carried to Babylon, and there they remained in tolerable comfort for 56 years, though the duration of the Captivity is usually reckoned at 70 years, dating from the earlier captivity. Many of them acquired property, and even riches; some were called to court, and even raised to high offices in the state. They were allowed the free exercise of their religion, and here Ezekiel and the unknown author of the last part of the book of Isaiah gave hope to the spiritual aspirations of the despondent people. When Cyrus overthrew the Babylonian empire (538 B.C.), he allowed the Jews to return to their own country, but only 42,360 of the tribes of Judah, Benjamin, and Levi are said to have returned. They found the depopulated territory occupied with a mixed population from the surrounding tribes and the residue of the Jewish population; and with the religious isolation they had learned in Babylon, refused to recognise these as members of their own community. See JEWS.—The name is frequently applied in church history to the exile of the popes at Avignon from 1309-77.

Babyroussa. See BABIROUSSA.

Bac'carat (Fr. *Baccara*) is one of the most widespread French games of chance, played for money between a banker and several punters. In Britain, as a game of cards other than a game of skill, it is treated as 'unlawful.' See GAMING.

Bacchiglio'ne, a river of Northern Italy, rising in the Alps, and flowing 90 miles south-eastward, through the plain of Padua, and past the town of Vicenza, till it falls into the Adriatic 3 miles south of Chioggia.

Bacchus, one of the names among the Greeks and the usual name among the Romans for Dionysus, the god of wine. Originally a mere epithet or surname, it does not occur in Greek writers till after the time of Herodotus, and its use is generally confined to the god in his more riotous aspects. The name Dionysus occurs also in Latin, though not in the Augustan poets. His worship was introduced into Rome from Greece, and was amalgamated with the worship of Liber, an old Italian deity who presided over planting and fructification. The Liberalia, celebrated every year on the 17th of March, on which day youths received the manly toga, must be distinguished from the triennial Bacchanalia or Dionysia. The latter, soon after its introduction into Italy, became the cloak for shameful immorality and crime, but was finally prohibited by the senate, 168 B.C. See DIONYSUS.

Bacchyl'ides, a Greek lyric poet and contemporary of Pindar, who flourished in the 5th century B.C. at the court of Hiero of Syracuse. A few fragments of his epinikian odes have long been known. But in 1896, on a papyrus brought from Egypt to the British Museum, Dr Kenyon deciphered 1070 lines and part of nearly 200 more. Some twenty odes were thus recovered, containing much that is charming, but nothing comparable for power to Pindar. See Kenyon's edition of the text (1897), and Jebb's, with prose translation (1905).

Baccioc'chi, PRINCESS. See BONAPARTE.

Baccio della Porta. See BARTOLOMMEO.

Bach, JOHANN SEBASTIAN, was born at Eisenach in 1685, probably on 21st March. The family, which traced its origin from one Veit Bach, a baker and miller who lived about 1550, and was exceedingly fond of music, had already produced many musicians, among whom two brothers, cousins of Sebastian's father, Ambrosius, were the most eminent. Johann Christoph and Johann Michael Bach wrote several excellent motets, and their writings had considerable influence on their illustrious kinsman. The love of music was so general throughout the family, that at Erfurt, where one branch of the clan was settled for many years, the town-musicians were commonly called 'the Bachs,' even though there might not be any member of the family among them at the time. Before he was ten years old, Sebastian lost his father, and was placed under the care of an elder brother, Johann Christoph, who was organist at Ohrdruf. He undertook the boy's musical education, but apparently in dread of his too rapid progress, kept from him a manuscript volume of organ pieces by various masters. Sebastian managed to obtain possession of the book by drawing it through the lattice of the bookcase in which it was locked away, and to copy its contents, working only by the light of the moon for fear of detection; his sole reward for six months' labour was the confiscation of his copy on its discovery by his brother. In 1700 he entered the choir of St Michael's school at Lüneburg, remaining there, after his beautiful soprano voice had broken, as accompanist on the harpsichord, and also as a violinist. During this period he made several excursions to Hamburg, where a cousin of his, Johann Ernst Bach, was living, in order that he might hear the famous organist Reinken play. In 1703 he was given a court appointment at Weimar, where he had the opportunity of hearing a great deal of Italian instrumental music; in the following

year, while on a visit to some of his many relations at Arnstadt, he was offered the post of organist to the New Church, and it was here that he began to compose in real earnest. Many of his 'church cantatas' were written here, as well as the famous 'Capriccio on the Departure of a Brother,' composed when his brother, Johann Jakob, went to join the Swedish Guard. In October 1705 he obtained four weeks' leave of absence in order to go to Lubeck and hear Buxtehude, the great Danish organist and composer, who was then nearly seventy years old. Bach was so delighted with him and his compositions that he outstayed his leave of absence, and on his return the authorities censured his conduct in this and other matters, such as accompanying the hymns in a manner that did not suit the taste of the congregation. His intimacy with a cousin of his, Maria Barbara Bach, who had lately come to Arnstadt, was also made a ground for reproof; so that he began to look for a new post. This he found at Muhlhausen, where he was installed in June 1707. On 17th October of that year he returned to Arnstadt in order to marry the cousin just mentioned, and settled down to his new work. He only remained at Muhlhausen one year, since a far more congenial sphere of action presented itself at Weimar, where he was now appointed court organist. The nine years spent at the ducal court did much to perfect Bach's style as a composer for the organ, and some of the best of his cantatas were also written there. The works of the great Italian composers of the time were studied in such a manner that Bach soon became complete master of their style of writing, and thus prepared for his own instrumental works which were to be produced later. Many journeys were made from Weimar, the most famous of which is one that resulted in the discomfiture of a French harpsichord player named Marchand. In 1717 Bach went to Dresden, where this man's playing was universally admired; the merits of the two musicians were hotly discussed, and it was determined that Bach should challenge Marchand to a public musical competition. The Frenchman accepted the challenge, but when the day came, was nowhere to be found. He had enough perception to see that the competition could only bring defeat upon himself, and so had beaten a retreat. Soon after this, Prince Leopold of Anhalt-Cöthen offered Bach the post of capellmeister at his court, a situation which he retained till 1723. A journey to Halle, made with the purpose of seeing Handel, who was there at the time, failed of its object, as Bach got there too late; nor was a subsequent attempt to meet his great contemporary more successful. A severe calamity befell him in 1720, when his wife died during his absence with the prince at Carlsbad; he bore her loss, however, manfully, and went on with his accustomed duties, paying another visit to Reinken at Hamburg in the same year. In December 1721 he married Anna Magdalena Wülkens, daughter of the court trumpeter at Weissenfels. She was extremely musical; much of his music exists in copies made by her hand, and many of his works for keyed instruments were written for her use. Most of the well-known 'suites' date from this time, as well as many works for stringed instruments. The first half of the wonderful collection of *Forty-eight Preludes and Fugues*, called in Germany *Das Wohltemperirte Clavier*, was also written at Cöthen, the second half being composed many years afterwards. At the end of the year 1722 the post of Cantor of the Thomaschule at Leipzig became vacant, and after some difficulties and delays Bach was given the appointment. During his residence at Leipzig, all his greatest works for chorus were written, among

which the most important are the two settings of the history of the Passion, in the versions of St Matthew and St John respectively, many church cantatas, the total number of which, together with those already mentioned, reached nearly three hundred, and the Mass in B minor. Two movements from this latter work were presented to Augustus III. at one of Bach's frequent visits to Dresden, where he received in 1736 the honorary title of Hofcomponist. A more famous visit was that paid to Frederick the Great at Potsdam, in May 1747. His arrival was announced to the king while a state concert was going on; Frederick immediately laid down his flute, and sent for Bach to come to court just as he was. Some pianofortes made by Silbermann were tried by Bach, who subsequently improvised on a theme given to him by the king. This theme he afterwards worked up in many different ways, and presented the result to Frederick under the title of *The Musical Offering*. This, like the *Art of Fugue*, a work begun about this time, and upon which he was engaged at the time of his death, is a monument of contrapuntal ingenuity and theoretical learning. Some two and a half years after this visit, his eyesight began to give way, and he was persuaded to have recourse to an English oculist then resident in Leipzig. The failure of an operation resulted in absolute blindness, and worse than that, the remedies used affected his health. In July 1750 he was struck with apoplexy, and died on the 28th of the month.

No composer who ever lived can be held to surpass Bach either in the ease of his intricate workmanship or in the wealth of invention with which he was endowed. The broad effects which came so easily to Handel, and by which so many thousands have been impressed, did not come within Bach's province; but in his 'B minor mass,' for instance, there are revealed depths of sorrow and heights of ecstatic adoration, which no musician before or since his time has ever attained. That his music appeals less to the untaught than to the cultivated lover of the art, cannot surely be held as a reproach. His greatest compositions for keyed and stringed instruments, taxing as they do the utmost powers of modern artists, must have been far beyond the reach of the executants of his own day. The pianist of the present day owes to Sebastian Bach not only the system of tuning by which he is enabled to play in all keys, but the method of fingering by which all his fingers are brought into requisition. Several other inventions were made by Bach, but none have been proved of lasting value. One of his sons, Carl Philipp Emanuel, holds an important place in the history of music, since he did much to develop the so-called 'sonata-form,' in which all classical compositions of modern times are cast, and moreover became the teacher of Joseph Haydn. Wilhelm Friedmann, Sebastian's eldest son, dissipated his fine musical talents, leaving comparatively few compositions; the youngest son, Johann Christian, has some interest for Englishmen, since he established himself in London, holding positions there of some consideration.

Biographies by Forkel (1803; trans. Terry, 1920), Hilgenfeldt (1850), Bitter (2d ed. 1880-81), and others were superseded by Spitta's exhaustive work (1873-80, trans. 1884-85). Valuable criticisms have been published by Albert Schweitzer (trans. 1911) and André Pirro (1907). And there are English works by Miss Kay Shuttleworth (1873), Lane Poole (1882), Rutland Boughton (1907), Parry (1910), Terry, and Grace (1922).

Ba'charach, a small town of Rheinland, on the left bank of the Rhine, 30 miles S.E. of Coblenz by rail. Population, 1900. Its name is said to be a corruption of *Bacchi ara* ('Bacchus's

altar'), and the vine is still largely cultivated in the neighbourhood. Here Blucher crossed the Rhine on January 1, 1814.

Bache, ALEXANDER DALLAS, American physician, a grandson of Benjamin Franklin, was born at Philadelphia, 19th July 1806, and in 1821 studied at West Point, became president of Girard College (1836) and superintendent of the coast survey (1843), and died 17th February 1867. He published magnetic and meteorological observations.

Bache, FRANCIS EDWARD (1833-58), born at Birmingham, showed great promise as a composer in a trio, two operettas, a concerto, and other works. His brother Walter (1842-88) became a distinguished pianist, a great exponent of Liszt, and a professor in the Royal Academy of Music.

Bachelor, a word of uncertain origin, derived, perhaps, with most probability through French from the Low Latin *baccalarus*, 'a farm-servant,' originally 'a cow-herd;' from *bacca*, Low Latin for *vacca*, 'a cow.' Odd though it seem, this will connect fairly with the special meanings of the word given by Ducange. (1) It was used, he says, to indicate a person who cultivated certain portions of church-lands called *baccalaria*, a feu belonging to an inferior vassal. (2) It indicated monks in the first stages of monkhood. (3) It was used by later writers to indicate persons in the probationary stage of knighthood—i.e. not squires simply, but knights who, from poverty and the insufficient number of their retainers or from nonage, had not yet raised their banner in the field. (4) It was adopted to indicate the first grade or step in the career of university life. As an academical title, it was first introduced by Pope Gregory IX. in the 13th century, into the university of Paris, to denote a candidate who had undergone his first academical trials, and was authorised to give lectures, but was not yet admitted to the rank of an independent master or doctor. Later it was introduced into the faculties other than theology as the lowest academical honour, and adopted by the other universities of Europe (see DEGREE, UNIVERSITY), and in this sense the Latin form came to be written, at first through mere word-play, *baccalaureus*, as if connected with *bacca lauri*, 'laurel berry.' (5) It came to be used in its popular meaning of an unmarried man, who was thus regarded as a candidate or probationer for matrimony.

The legislation of almost every country, at some period of its history, has imposed penalties on male celibates or bachelors, on the principle that every citizen is bound to rear up legitimate children to the state. In Sparta, at Athens, and at Rome, various penalties were imposed on celibates, various premiums offered for fruitfulness. In England, there are numerous instances of additional or higher taxes being imposed on bachelors and widowers, but apparently more with a view to the revenue than with any other object. Thus, an act was passed in 1695, which granted to the king certain rates and duties upon marriages, births, and burials, and upon bachelors and widowers for five years, 'for carrying on the war against France with vigour.' Every unmarried male above the age of twenty-five had to pay from 1s. to £12, 10s., according to his status. Another instance may probably be found in the higher charge for the servants of bachelors, first imposed by Pitt in 1785, and continued for a considerable time. In the income-tax of 1799, deductions were made on account of children, 5 per cent. being allowed to a person who had a family, and whose income was above £60 and under £400 a year, with corresponding deductions in other cases. The principle of allowing abatement of income-tax

to a tax-payer who is the parent of living children was reintroduced in 1910. See also KNIGHTHOOD.

Bachelors' Buttons, a double-flowered Ranunculus, Lychnis, Achillea, Pyrethrum, &c.

Bachian. See BATCHIAN.

Bachofen, JOHANN JAKOB (1815-87), was a member of the Court of Appeal at Basel, and wrote an important work on the Matriarchate, and other works on the history of law and of civilisation.

Bacillus (late Lat., 'little rod,' diminutive of *baculus*, 'stick'), properly the name of a distinct genus of Schizomycetes, but popularly used in the same sense as bacterium. See BACTERIA.

Back, SIR GEORGE (1796-1878), Arctic explorer, was born at Stockport, and entering the navy in 1808, next year was taken prisoner by the French in Spain. With Franklin (q.v.) he had already shared in three Polar expeditions—to the Spitsbergen Seas (1819), the Coppermine River (1819-22), and Mackenzie River (1822-27)—when he started (June 1833) from a station of the Hudson Bay Company in search of Captain Ross, who was supposed to have been lost in his attempt to discover the North-west Passage. After passing a terrible winter with his companions near the Great Slave Lake, he discovered, in 1834, Artillery Lake and the Great Fish River, or Back's River, which he traced to its mouth. Hindered by the ice from proceeding along the coast, he returned by the river, and did not reach England till the autumn of 1835, when he was raised to the rank of captain by order in council, an all but unprecedented honour. In 1836 and 1837 he further explored the Arctic shores; and of this, as of the preceding voyage, he published a vivid description. He was made admiral in 1857; but the hardships which he had gone through disabled him from further active service.

Backbone. See SPINAL COLUMN, also VERTEBRATA.

Backergunge. See BAKARGANJ.

Backgammon, a game of considerable antiquity in England, where, until the 17th century, it was known by the appellation of 'the tables.' Apparently the word is merely 'back-game,' and may have been given because the two players have to bring their men *back* from their antagonist's tables into their own, or because the pieces are sometimes taken up and obliged to go *back*—i.e. re-enter at the table they came from. The French name is *tric-trac*. Backgammon is played with a board or tables, men or pieces, dice, and dice-boxes. The introduction of dice into the game, and their constant use in determining moves, makes backgammon essentially a game of chance. The backgammon board consists of two parts or tables, each possessing twelve points, six at each end, which points are coloured white and black alternately. The game is played by two parties, and with 30 pieces or men. Each party has 15 men, one set of 15 being black, and the other white. In beginning the game, the men are placed on certain points on the tables, as shown in the following figure. The game is played with two Dice (q.v.) and two dice-boxes. The dice are common to both; but each party uses his own dice-box, and the throws are alternate. If a player throws *doublets*, or both dice of one number, double the number of dots is reckoned; thus, by a throw of two aces, the player does not count 2, but 4. These numbers thrown or accidentally turned up by the dice bear a reference to the points on the tables. In order to understand this connection between the dice and the men, the learner must observe how the men are placed on the points, and the rules by which their shifting from one to another is governed.

The tables are here spread out as if two persons were seated, and about to begin to play. The player owning the white men is seated at W, and the player owning the black men at B. We shall call one player White, and the other Black. White counts round from the ace-point of Black, and Black counts round from the ace-point of White.

The Backgammon Table.

These ace-points are respectively seen to have two men upon them in opposite corners of the same table. The grand object of the game is for each party to get all his men played round into the table containing the aces, removing them from point to point agreeable to the throws of the dice. In throwing, the number upon each die turned up may be reckoned by itself, or collectively, with the number on the other die. Thus, if 4 be thrown by one die, and 6 by the other, a man can be advanced 4 points, and another 6 points; or one man can be advanced 10 points, always providing that a point is open to suit this movement to it. No point can be moved to if covered by two men belonging to the adversary. If covered by only one man, which is called a *blot*, then that man can be hit, and be removed from the point, and placed on the bar between the tables, his place being taken by the man who has won it. The removal of a man to the bar throws a player considerably behind in the game, because the man must remain out of the play till the dice turn up a number corresponding to an open point on the adversary's table. Being fortunate to get an open point by this means, the man must be entered and wrought round from thence, as in the case of others in the set to which he belongs. The frequent occurrence of this hitting of a blot gives an adversary a great advantage, and allows him to win the gammon. There are two kinds of victory—winning the hit, and winning the gammon. The party who has played all his men round into his own table, and by fortunate throws of the dice has borne or played the men off the points first, wins the *hit*. The gammon may be explained as follows: When you have got all your men round to your own table, covering every point, and your adversary has a man out, then you are enabled to *bear* or lift your men away. If you can bear all away, so as to clear your table before the adversary gets his man placed by a throw on your table, you win the gammon. If the adversary has been able to bear one before you have borne all your men, it reduces the victory to a hit. Two hits are reckoned equal to one gammon in playing matches. To win two games out of three is called winning the *rub*, as at whist.

Backhuysen, or BAKHUIZEN, LUDOLF, a famous marine painter of the Dutch school, was born at Emden in Hanover, in 1631, and in 1650 was placed as a clerk in Amsterdam, but soon devoted himself to painting. His most famous picture is the sea-piece in the Louvre, sent in 1665 as a present to Louis XIV. by the magistrates of Amsterdam. His colouring is excellent, though somewhat cold. He etched on copper, and gave lessons in caligraphy. He died in 1708.

Bacolor, a town of the island of Luzon, Philippines, 10 miles NW. from Manila; pop. 13,000.

Bacon, DELIA, American authoress, born 1811, died 1859. She was eminent in her day as a teacher, and wrote several stories, but is now remembered only as an eloquent advocate of the theory that the plays of Shakespeare were written by Lord Bacon. She herself did not originate the idea, but was the first to give it any currency, in her *Philosophy of the Plays of Shakespeare Unfolded* (1857). The book had the honour of a preface from the pen of Nathaniel Hawthorne, and the theory has been accepted by not a few persons in England, America, and Germany, who have devoted ingenious reasoning to its advocacy. In Wyman's *Bibliography of the Bacon-Shakespeare Controversy* (Cincinnati, 1884), there were no less than 255 entries. Donnelly in *The Great Cryptogram* (1888) tried to show Bacon's cipher concealed in the plays of Shakespeare; Bormann, in *Das Shakespeare-Geheimniss* (Leipzig, 1894), sought in an elaborate study to prove that the gaps in the scheme of Bacon's acknowledged works were filled by the Shakespearian dramas. A biography by T. Bacon (1889) gives the pathetic story of Delia Bacon's life.

Bacon, SIR NICHOLAS, was born in 1509, most likely at Chislehurst, Kent, and passing from the abbey school at Bury to Corpus College, Cambridge, (1523), was ten years later called to the bar. In 1537 he was appointed solicitor to the Court of Augmentations, and in 1539, on the dissolution of the monasteries, he presented to Henry a reasonable project for applying their revenues to the founding of a college for the study of diplomacy. Unfortunately, the king had already dispensed the forfeited estates. Of these the young lawyer received no small share; and in 1546 he was advanced to the office of attorney of the Court of Wards. During Mary's reign his Protestantism cost him all his public honours and emoluments; but on her death in 1558, he received from Elizabeth the post of lord keeper of the Great Seal. Elizabeth left to him and to Cecil 'the ordering of church matters for the most part;' and Parker chiefly owed to him the see of Canterbury. He was always honestly opposed to Catholics generally, above all, to Mary of Scotland. Elizabeth honoured him with several visits—one of six days in 1577, at his magnificent mansion of Gorhambury, Hertfordshire. He died at York House, his London residence, 20th February 1579. A profound lawyer, and all but a great orator, Sir Nicholas was one of those solid and stately Englishmen to whose sagacity, high principle, and firm demeanour England owed its safety in that critical period when Elizabeth mounted the throne.

Bacon, FRANCIS, Lord Verulam and Viscount St Alban, or St Albans, born at York House, in the Strand, London, 22d January 1561, is usually (apparently even by himself) called Lord Bacon. The younger son of Sir Nicholas Bacon (q.v.) by his second wife Ann, second daughter of Sir Anthony Cooke, Edward VI.'s tutor, he passed his boyhood with his brother Anthony under the stern discipline of his mother, a woman of powerful will and a zealous Calvinist. When twelve years old, he, with

Anthony, entered Trinity College, Cambridge, where the brothers remained till Christmas 1575. In June 1576 they began to study law as 'ancients' of Gray's Inn. A year later, Bacon went to Paris in attendance on the ambassador Sir Amias Paulet, but his father's death recalled him in 1579. Little property fell to his share, and he applied himself anew to the law, being called to the bar in 1582, and becoming a bencher of his inn in 1586.

From an early age Bacon exhibited extraordinary intellectual capacity. Queen Elizabeth noticed his precocity when he came to court with his father: at Cambridge the youth recognised the barrenness of scholastic philosophy and the need of educational reform, and soon afterwards became conscious of power in himself to apply to science original methods of study, which should extend man's knowledge of nature beyond any limits yet reached. To fulfil this ambition he resolved to adapt his career. Lucrative employment was necessary to supply him with the means of research, and he was twice injudicious enough (1580 and 1592) to assert openly that he subordinated everything to his 'contemplative ends,' when petitioning the powerful minister Burghley, who had married his mother's sister, for place about the court. Burghley declined to aid him, and to advance his worldly interests Bacon added to his legal practice an independent pursuit of politics. He became member of parliament for Melcombe Regis in 1584, for Taunton in 1586, and for Middlesex in 1593; and sought to attract the queen's attention by addressing to her a paper of advice in 1584, in which, with a boldness unique in a barrister of three-and-twenty, he argued for more tolerance in the treatment of recusants, and by writing in 1589 a statesmanlike pamphlet on the controversies in the Anglican Church, in which he pleaded for elasticity in matters of doctrine and discipline. These efforts were overlooked, and in 1593 he offended the queen by opposing in parliament the grant of a subsidy. Meanwhile, in despair of obtaining any favour from Burghley, Bacon attached himself to the brilliant and impulsive Earl of Essex, Burghley's rival at court, through whom he thought to put into effect some of his political schemes. Essex, who also took Bacon's brother Anthony into his service, strove in vain to obtain for Bacon in 1593 the office first of attorney and then of solicitor general, and in 1596 that of master of the rolls. Bacon's disappointments were embittered by want of money, and he gladly accepted from Essex a gift of land at Twickenham. To enable Essex to secure a permanent hold on the queen's favour, Bacon recommended him to employ petty tricks of flattery, which were ill adapted to his frank and impulsive character, and Bacon soon found that he had misunderstood his patron. He advised him in 1598 (although he afterwards denied having done so) to undertake the suppression of Tyrone's great rebellion in Ireland, and when the earl returned thence in disgrace (September 1599) and was tried in June, Bacon, at his own request, acted (in a subordinate capacity) with the prosecuting counsel, in the hope, as he said, of aiding his patron. Essex was dismissed from all offices of state, and released in August. Bacon, like his brother Anthony, seemed anxious for his reinstatement in the queen's favour, but when Essex broke into open rebellion in January 1601, Bacon voluntarily endeavoured to secure his conviction on the capital charge of treason; drew up after the execution the official declaration of Essex's treasons; and apologised in another paper for his own conduct, on the ground that the maintenance of the state is superior to private ties of friendship.

In the last years of Elizabeth's reign, Bacon tried,

in and out of parliament, to act the part of mediator between crown and commons, and recommended a tolerant policy in Ireland. On James I.'s accession (1603), Bacon sought royal favour by extravagant professions of loyalty; by planning schemes for the union of England and Scotland, and for pacifying the Church of England on comprehensive lines; and by making speeches in parliament, in which he tried to prove that the claims of the king and parliament could be reconciled without degrading either estate. For these services he was knighted (23d July 1603), and was made a commissioner for the union of Scotland and England. In 1604 he received a pension of £60 a year in consideration (as the patent stated) of James's respect for his brother Anthony, who had died in 1601, after proving himself a staunch champion of the Scottish succession. In 1605 Bacon showed how his leisure had been employed, by publishing the *Advancement of Learning*; and on 10th May 1606 he married Alice Barnham, a London alderman's daughter, of whose personal character nothing is known. His public fortune had now changed. On 25th June 1607 he became solicitor-general, after a delay caused partly by the opposition of Burghley's son and successor, Sir Robert Cecil, and partly by Bacon's unwillingness to serve under Sir Edward Coke, a personal enemy, who was attorney-general till 1607.

In the last session of James's first parliament (February 1611) the differences between crown and commons grew very critical, and Bacon assumed his former rôle of mediator, although he confessed his distrust of James's chief-minister, Cecil (now created Lord Salisbury). At the same time he argued in published tracts that reform could best be assured by a liberal use of the king's prerogative. On Salisbury's death in 1612, Bacon informed the king that he was willing to devote himself exclusively to politics, and offered to manage parliament and to obtain supplies without concerting undignified bargains after Salisbury's discredited methods. He was disappointed of the office of master of the wards at this time, but, on 27th October 1613, was promoted to the attorney-generalship. In the 'Addled Parliament' of 1614 Bacon was still sanguine of effecting what he called his policy *e gemino*, according to which the interests of king and people should be made to coincide. A sympathetic atmosphere between the two bodies was to be developed, and mutual concessions were to follow, accurately defined and spontaneously rendered. In October 1615 he pleaded in vain for a new parliament, while re-enuciating his sanguine views. By that date Bacon saw that James was as little likely as Essex to adopt his domestic policy, and soon perceived that the bold handling of foreign affairs, which he regarded as essential to the conservation of patriotism, was alien to the nature of a king who delighted in intricate diplomacy. But Bacon craved for personal advancement with increased eagerness, and henceforth he obtained it by suppressing his real opinions, by conventional flattery of all who could serve him, and by systematising petty tricks of conduct in order to circumvent the opposition of those likely to obstruct him.

In 1615 two prosecutions in which he engaged illustrate his servility. In one, Oliver St John was prosecuted for denouncing the illegality of benevolences, and made his submission. In the other, Edmund Peacham, an old Somersetshire clergyman, was charged with having written a sermon, which he had not preached, justifying insurrection under certain circumstances. Torture was applied with Bacon's assent, although not at his suggestion, and Bacon examined the prisoner while undergoing it,

without extracting any information. It was then resolved to prosecute Peacham for treason in the King's Bench, and Bacon undertook to confer separately and privately with each judge of the court, in order to secure a conviction. Three judges yielded to Bacon's advice, but Coke resisted, and at the trial denied that Peacham, who was convicted and died in prison, was guilty of treason. In 1616 Bacon prosecuted Somerset, with whom he was intimate, for the murder of Overbury, and in that and the next year helped to secure Coke's dismissal from the bench, on the grounds, first, that the judge denied the superiority of the Court of Chancery to his own Court of King's Bench, and secondly, that he allowed the king's prerogative to be questioned in an exchequer case.

On 9th June 1616 Bacon became a privy councillor, and on 7th March 1617 Buckingham, whom Bacon had persistently courted, obtained the lord-keepsership for him. On 7th January 1618 he became lord chancellor, and on 12th July he was raised to the peerage as Lord Verulam. The title was taken from *Verulamium*, the Latin name of St Albans, near which lay Bacon's estate of Gorhambury. Bacon's obsequiousness was now more marked than ever. He accepted the king's policy of the Spanish marriage, although it was hostile to all his principles, and by exceptional self-abasement averted a quarrel with Buckingham, whose brother's marriage with Coke's daughter Bacon had vindictively opposed. A word from Buckingham influenced his behaviour to suitors in the Court of Chancery, where he worked hard in clearing off arrears. In one case, a Dr Steward complained to Buckingham that Bacon had decided a case against him; Buckingham wrote to Bacon expressing his surprise, whereupon Bacon cancelled his decision, and referred the case anew to arbitrators outside the court. Bacon was on the side of severity in the cases of Raleigh (1618) and of his own friend Sir Henry Yelverton (1619). In 1620 he advised the summoning of a new parliament; on 12th October in that year published his *Novum Organum*; and on 26th January 1621, was created Viscount St Albans. But his fall was now at hand. The Commons, led by Bacon's enemy Coke, first inquired into a recent increase of monopoly-patents, by which Buckingham had enriched his relatives. Bacon had argued for their legality, and parliament was anxious to call him to account for this opinion, but the king refused to sanction the step. Complaint was then made that Bacon was in the habit of taking bribes from suitors in his court, and on 17th March 1621, charges were sent to the House of Lords by the Commons for inquiry. Bacon fell ill. That he took presents from suitors was undeniable, but that he allowed these gifts to influence his judicial decisions has been disputed with some effect. Nevertheless, the Steward case shows that Bacon was guilty, in one instance at least, of polluting justice. On 20th April, a copy of the accusation was sent him, and a week later he submitted himself to the will of his fellow-peers, without offering any defence. It was ordered that he be fined £40,000, be imprisoned during the king's pleasure, and be banished parliament and the court. In June he was released from the Tower, and retired to his family residence at Gorhambury, near St Albans. In September the king pardoned him, but declined to allow him to return to parliament or the court. Bacon employed himself in literary work, completing his *Henry VII.* and his Latin translation of his *Advancement* (*De Augmentis*). In March 1622 he offered to make a digest of the laws, but no further notice was taken of him in spite of the frequent petitions that he addressed to Buckingham, James I., and James's successor, Charles. In

March 1626 he caught cold while stuffing a fowl with snow near Highgate, in order to observe the effect of cold on the preservation of flesh. He was removed to the neighbouring house of Lord Arundel, where he died on 9th April. He was buried in St Michael's Church, St Albans. He was fond of pomp in his domestic arrangements, and died deep in debt.

Bacon's literary work occupied the greater part of his time throughout his life. It is divisible into philosophical, purely literary, and professional writings. To the first the chief importance is to be attached. Bacon's philosophy is to be studied in (1) *The Advancement of Learning* (1605), a review in English of the state of knowledge in his own time, and its chief defects; (2) *De Augmentis Scientiarum* (1623), a Latin expansion of *The Advancement*; and (3) *Novum Organum, or Indications respecting the Interpretations of Nature* (1620), which was intended to form the second book of a never-completed greater treatise, *Instauratio Magna*, a review and encyclopædia of all knowledge. To the *Novum Organum*, preliminary drafts of which are to be found in a number of detached pieces, *Cogitata et Visa*, *Temporis Partus Masculus*, &c., was prefixed a *Distributio Operis*, a plan of the greater work; and in *Historia Ventorum* (1622), *Historia Vitæ et Mortis* (1623), *Historia Densi et Rari* (1658), and *Sylva Sylvarum* (collection of collections, 1627), materials chiefly consisting of digested facts of natural history, for other portions of the *Instauratio*, are extant.

Bacon's system for interpreting Nature which was to lay the foundations of the natural sciences is exhibited in all these works. He first abandons the deductive logic of Aristotle and the schoolmen, in which preconceived theories were constructed without reference to actual fact, and were syllogistically arranged to lead to elaborate conclusions never tested by observation and experiment. Bacon relied on inductive methods—on the accumulation and systematic analysis of isolated facts to be obtained by observation and experiment. From this assemblage of facts alone were any conclusions to be drawn. The induction was to rest not on a simple enumeration of phenomena, a method familiar to predecessors of Bacon, but on their careful selection and arrangement, with necessary rejections and eliminations. 'Phantoms of the human mind'—'idols' (*eidola*) of the tribe, the cave, the market-place, and the theatre, as Bacon called them—inherited by man, or produced by his environment, were exposed and swept aside. Nothing was to obscure the 'dry light of reason.' Bacon took all knowledge for his province, and his inductive system was to arrive at the causes not only of natural but of all moral and political effects. While developing his new scientific method, Bacon made some shrewd scientific observations. He described heat as a mode of motion, and light as requiring time for transmission, but he was behind the scientific knowledge of his time; he makes no mention of Harvey's discovery of the circulation of the blood, of Napier's logarithms, or of Kepler's calculations, and rejected the Copernican astronomy. His system was never finished. He never reached his examination of metaphysics—of final causes—which was to succeed his treatment of physics.

His greatness consists in his repeated insistence on the facts that man is the servant and interpreter of Nature, that truth is not derived from authority, and that knowledge is the fruit of experience. The impetus which his inductive methods gave to future scientific investigation is indisputable. As he himself described it, he 'rang the bell which called the other wits together.' He was the practical creator of scientific induction, and although

succeeding scientific experimentalists may have been unconscious of their indebtedness to him, their chief results are due to their adoption of his logical method. An attempt has been made to credit Bacon with the parentage of the English philosophy of Hobbes, Locke, and Hume. That Bacon, like these philosophers, was an empiricist or realist is obvious; but that his philosophy was systematic enough to originate a school of thought, in the same sense that Descartes and Hegel founded a philosophic school, is untrue.

As a writer of English prose and a student of human nature, Bacon is seen to best advantage in his Essays, ten of which were first published in 1597; after passing through new editions in 1598, 1604, 1606, and 1612, they reached the final number of 58 in 1625. Full of practical wisdom and keen observation of life, written in concise language of extraordinary pith and dignity, they illustrate the worldly shrewdness of their author, as well as his quickness and accuracy of perception. His *History of Henry VII.* (1622) shows scholarly research, besides a direct and nervous style. In his fanciful *New Atlantis*, Bacon suggests the formation of scientific academies—a suggestion to which the foundation of the Royal Society has been traced. Bacon's *Apophthegms* (1625) are a disappointing collection of witticisms. His religious works included prayers and verse translations of seven Psalms (1625), which display a personal piety difficult to reconcile with his conduct. And neither his Psalms nor two or three other poems credited to him on doubtful authority suggest poetic power. Bacon's professional works embrace *Maxims of the Law* (1630), *Reading on the Statute of Uses* (1642), pleadings in law cases, and speeches in parliament. He seems to have called himself (on his title-pages) 'the Lord Bacon' as well as 'Viscount St Alban'; and from Archbishop Tenison to Macaulay and since, it has been usual to refer to him as Lord Bacon, and not as Lord Verulam or Lord St Alban.

'For my name and memory,' Bacon wrote in his will, 'I leave it to men's charitable speeches and to foreign nations and the next ages.' An unparalleled belief in himself, which justified to himself his ignoring of all ordinary laws of morality, is the leading feature in his character. He was taught by the example of the Machiavellian politicians who were his father's friends to disregard elementary notions of right and wrong; in early youth he was conscious from the first of the possession of intellectual power which, if properly applied, could revolutionise man's relations with nature, and as a consequence he recognised no justice in any moral obstacle which might prevent his attainment of such material wealth and position as would enable him to realise his intellectual ambition. Neither Macaulay's mingled contempt and admiration, nor Pope's popular epigram in his *Essay on Man* (iv. 281-2)—

If parts allure thee, think how Bacon shined;
The wisest, brightest, meanest of mankind—

is an adequate summary of his character. Bacon found it necessary to turn much of his attention to politics in his attempt to gain worldly power, and showed there some of his mental capacity. But he was never absorbed in politics, and always regarded himself (as he phrased it) in great part a stranger in the political sphere; his political principles were not large enough or definite enough to enable him to play a commanding part in the constitutional crisis. He did not make sufficient allowance at any time for the natural dispositions and abilities of the men with whom he worked. He drew up practical rules and sketched out elaborate tricks for the conduct of those who, like himself, were the architects of their own fortunes. But he failed entirely as a manager of men. It is

only in scientific and literary work that he was great; but there very few have proved greater.

Dr Rawley, Bacon's chaplain in 1638, and Isaac Gruter in 1653, at Amsterdam, issued imperfect collected editions of Bacon's works. Others followed in 1655 (at Frankfurt), in 1730 (by Blackbourn), and in 1825-36 (by Basil Montagu). The last was superseded only by the complete edition of Spedding, Ellis, and Heath (14 vols. 1857-74), seven volumes of which were devoted to the apologetic *Life and Letters* by James Spedding. For the Baconian system, see also Kuno Fischer's *Francis Bacon von Verulam* (1856; Eng. trans. 1857); Professor Fowler's edition of the *Novum Organum* (1878); and Professor Nichol's *Francis Bacon: his Life and Philosophy* (2 vols. 1890). For bibliography, see *Life* by G. W. Steeves (1910). Macaulay's brilliant attack on Bacon's character, and eulogy of his philosophy (first issued in *Edinburgh Review*, July 1837), lack sobriety in both sections. S. R. Gardiner's account of Bacon in his *History* and in the *Dictionary of National Biography*, where Bacon is represented as a far-seeing politician, Dean Church's monograph in the *Men of Letters Series* (1884), and Dr Abbott's *Life* (1885), form valuable commentaries on Spedding's conclusions.

Bacon, JOHN, sculptor, was born in London, 24th November 1740, and, trained as a modeller and painter on porcelain, in 1769 he received the first gold medal for sculpture awarded by the Royal Academy, of which next year he was made an associate, in recognition of the high merit of his statue of Mars. Among his principal works are the monuments to Lord Chatham in Westminster Abbey and the Guildhall, to Howard and Johnson in St Paul's, and to Blackstone at All Souls' College, Oxford. Bacon's success aroused great jealousy, and his rivals claimed that he was deficient in imagination, and had no refined perception of beauty; but some of his emblematical figures display perfect classical taste. He died 4th August 1799.

Bacon, ROGER, a philosopher of the 13th century, who, through the force of his intellect, raised himself far above his age, made wonderful discoveries in several sciences, and contributed much to extend the then scanty knowledge of nature. Belonging to a well-to-do family, he was born probably in Dorset, near Ilchester, about the year 1214. He studied at Oxford, probably under Grosseteste and Rich, and lectured there and later at Paris. About 1250 he returned to Oxford, and possibly then entered the order of the Franciscans. Physics seems to have been at that time the chief object of his labours; and liberal friends of science supplied him with the means of pursuing his researches. In exploring the secrets of nature, he made discoveries and invented applications which were looked upon by the ignorant as the work of magic. This prejudice was encouraged by the jealousy and hate with which his brother friars regarded his superiority. For ten years (c. 1256-66) he was in Paris again, in ill-health, but not, as is often said, in prison. Among the clear-sighted men who had heard of Bacon's genius was Guy de Foulques, archbishop of Narbonne. He desired to see Bacon's writings, but the interdiction of the Franciscans prevented a compliance with his wish. On Guy's ascent, however, of the papal throne as Clement IV. in 1265, Bacon wrote to him expressing his readiness to furnish him with whatever he desired, and Clement in reply repeated the request to see his works. Bacon accordingly drew up his *Opus Majus*, which he sent, along with other works, it is said, to the pope, by his favourite pupil, John of London, and in which he represented the necessity of a reformation in the sciences through a diligent study of the languages and of nature. How Clement received them is unknown; but they could only have reached him about the time he was seized with his last illness in 1268. Bacon seems about this time to have returned to Oxford. In 1277 the

general of the Franciscan order, Jerome of Ascoli, declared himself against Bacon, forbade the reading of his books, and issued an order for his imprisonment, which was sanctioned by Pope Nicholas III. When in 1288 Jerome himself became pope, under the name of Nicholas IV., Bacon sent him a treatise on the means of warding off the infirmities of old age, with a view to convince him of the harmlessness and utility of his labours, but in vain. He seems to have at last recovered his freedom in 1290 or 1292, and in the latter year (or possibly 1294) to have died at Oxford. He criticised the scientific method of his time, condemned dependence upon authority, custom, and popular opinion, and the pretended knowledge that conceals ignorance. Mathematics applied to observation he considered to be the only means of arriving at a knowledge of nature. He believed in the philosopher's stone and in astrology. His chief invention is the magnifying-glass. There are also in his writings other new and ingenious views on optics—for example, on refraction, on the apparent magnitude of objects, on the great increase in the size of the sun and moon in the horizon. On other subjects, again, he fell into the greatest errors. He made several chemical discoveries which were wonders at that time. He knew, for instance, that with sulphur, saltpetre, and charcoal we may produce explosions. He studied several languages, and wrote Latin with great elegance and clearness. Deserving of honourable mention are his discoveries of the errors that prevailed in the calendar, his proposals and data for remedying them, and his rectified calendar. He wrote also on Greek and Hebrew grammar, and was perhaps author of a *Speculum Astronomiae* usually ascribed to Albertus Magnus. He had amply earned his title of 'Doctor mirabilis.'

Six of his works were printed in 1485-1614; Jebb edited the *Opus Majus* in 1733, as did Bridges in 1897-1901 (3 vols., the last correcting errors in the first two). Brewer had done the *Opus Tertium*, *Opus Minus*, and part of the *Compendium Philosophiae* in 1859. Rashdall issued the (fragmentary) *Compendium Studii Theologiae* (1911). Duhem discovered in 1905 in the Paris National Library a missing portion of *Opus Tertium*, which was really meant to be an expansion of the *Opus Majus*; and Little discovered in Winchester College, and published in 1912, a second missing portion. Steele has given us, in *Opera Hactenus Inedita* (1905 et seq.), parts of the *Compendium Philosophiae*. There are books on Bacon and his philosophy by Charles (Paris, 1861), Siebert, Schneider, Werner, Parrot, Fluegel, Vogl (1906), Bridges (1914), and a centenary volume of essays collected and edited by Professor Little (1914). For the popular conception of Friar Bacon as a magician associated with Friar Bungay, see Greene's play (edited by A. W. Ward) and Sir John Sandys in the centenary volume.

Bacon Beetle. See DERMESTES.

Bacsanyi, János, a Hungarian poet, was born 11th May 1763, at Tapolca. His first work, published in 1785, procured him an appointment in a public office, but a liberal poem cost him this in 1793, as well as his liberty the year after. In 1796 he came to Vienna, and there he married a few years later the German poetess, Gabrielle Baumgarten—an unhappy match. In 1809 Bacsanyi translated Napoleon's proclamation to the Hungarians, and was afterwards obliged to take refuge in Paris. After the peace of Paris he lived at Linz, and there he died, 12th May 1845.

Bacska, or BAČKA, a region of the Vojvodina in Yugoslavia, between the Danube and the Theiss, till 1920 a county of Hungary (Bács-Bodrog). The land is low and marshy, and very unhealthy, but of great fertility. It produces the best wheat; and wine, tobacco, and cattle are also exported. The capital is Zombor (q.v.). The people are Serbs, Germans, and Magyars. A small strip in the north remains Hungarian.

Bacteria (plural of late Lat. *bacterium*, Gr. *bakterion*, dimin. of *baktron*, 'stick,' 'staff'). It is a familiar fact that if water which contains or has contained organic matter either of animal or vegetable origin be left to itself, it soon becomes cloudy and covered with a film. If the floating flakes or surface scum be examined with the high power of a microscope, a marvellous exhibition of the lowest forms of life is presented. Representatives of the simplest animals, such as Infusorians, will probably be seen, and in some cases also some of the lowest single-celled plants, but all these will appear as giants amid a crowd of dwarf organisms, most of which are Bacteria. These usually appear as minute spheres, rods, or threads, propelled along by delicate lashes, or quivering together with the usual tremulousness of very small floating particles, or lying more passively entangled in a jelly-like flake. In a short time it will be seen that these bacteria multiply with extraordinary rapidity by cross division; one soon becomes a thousand, and the minute specks which first appear may, if the water contains enough food, soon form a mass filling the vessel. Wherever organic matter is in process of decomposition, in infusions as above indicated, or in disease or death, or within the living and healthy organism, there these bacteria are to be found.

So abundant are they, that in spite of their minuteness they did not escape the enthusiastic observation of the early workers with the microscope. Thus, in the 17th century, and with the comparatively imperfect microscope of those days, Leeuwenhoek described some of these low organisms. In 1773 O. F. Müller established two genera, *Monas* and *Vibrio*. Not much progress was made, however, till about 1838, when Ehrenberg and Dujardin included bacteria in their investigation of minute organisms. They referred the forms which they described to the animal series among Infusorians, and united a large number under the general title *Vibrionia*. Nor was this reference surprising, since naturalists had hardly begun to realise that animals have no monopoly of the power of movement, and since the mode of nutrition in bacteria is obviously very different from that of ordinary green plants. Gradually, however, it began to be clearly seen that in their structure and life-history bacteria are allied to the simple fungi, though this was not generally admitted until after the work of Cohn (1853) and of Nägeli (1857).

The bacteria or schizomycetes may be defined as extremely small, usually single-celled fungoid plants without chlorophyll, remaining single or united in loose colonies, reproducing rapidly by cross division or by the formation of spores, often occurring in myriad crowds enveloped in a jelly-like secretion, or separately with the power of energetic movement by means of flagella. As regards the mode of nutrition, three groups may be distinguished—(a) saprophytic forms living on dead organic matter, and producing decomposition and fermentation; (b) parasitic forms living directly on the tissues of their host; and (c) 'prototrophic' forms which require no organic food, being able to find their carbon-supply and nitrogen-supply in inorganic substances, such as carbon dioxide and ammonia. It is also important to notice that while many bacteria can only live in presence of free oxygen, others derive their oxygen from the organisms or decomposing media on which they live—a distinction which Pasteur expressed by the two terms, aerobic and anaerobic.

Terminology.—The term micro-organism is convenient as a general word, especially when the position of the form in question is still undetermined. The French word *microbe*, introduced by

Sédillot in 1878, has been approved by Littré, and is very widely used. It means a small living organism, and was invented to avoid dispute as to the plant or animal nature of low organisms like bacteria. It is now virtually equivalent to the latter. Bacterium is, like bacillus, properly the name of a distinct genus of schizomycetes, but the generic titles have both been too indiscriminately bestowed to be of much use, and are better restricted to popular designation.

The physiological significance of bacteria in relation to disease and fermentation will be the special subject of the article GERM THEORY. The present article has to do with the following points only—(1) distribution; (2) form and structure; (3) life-history; (4) general classification; (5) more important forms; (6) work of bacteria; and (7) the methods of research.

I. Distribution.—Bacteria are found practically everywhere—in air, water, and soil; in the mouths of men as well as on the walls of their houses; on the hair of the head and the toes of the feet; in chalk and coal; in food and drink; but especially where there is disease, death, or decomposition. To speak of the 'omnipresent bacillus' is hardly an exaggeration.

(a) *Air.*—Bacteria are often abundantly present, especially as spores, in the air, and particularly so in the vicinity of human dwellings and the like. Winds from crowded quarters, hospitals, slaughter-houses, &c., often carry myriads of microbes; but pure air from the polar regions contains hardly any. It cannot be too strongly emphasised that fresh air and sunlight are the most effective antagonists of our subtle enemies. Sunlight is rapidly fatal to some of the most virulent pathogenic species—e.g. the germs of anthrax and typhoid fever. It acts independently of the temperature, it is abetted by oxygen and moisture, and it doubtless kills by some chemical action, since the blue-violet and ultra-violet rays have the strongest 'bactericidal' effect. This healthful influence of light has begun to be directly utilised in medicine—e.g. in the cure of lupus. Statistics appear to show that the maximum abundance of bacteria in the air is in autumn, the minimum in winter; and that the number rises in times of drought and is reduced by heavy rainfall.

(b) *Water.*—Even pure water contains many bacteria, and always more than occur in air. The minimum occurs in condensed water-vapour (900 to the litre), the maximum (80 millions per litre, 1½ pint) of course in sewer water, especially if there be the least stagnation. If there be a proper flow of water, however, the germs never become dry enough to be floated in the air, and are not therefore dangerous. The sulphurous springs of the Pyrenees contain an abundant bacterium (*Beggiatoa*), which accumulates sulphur in its cell, and is especially abundant in the floating scum known as glairine or barégine (see BARÉGINE). Some bacteria, often called chromogenic (or colour-making) on account of their bright pigment, occur in water under certain conditions, and have given rise to superstitious accounts of 'blood-rain.' The red colour of stagnant pools in autumn has been known for fifty years as the result of a micro-organism, described by Ehrenberg as *Ophidomonas sanguinea*, but now known as a species of *Spirillum*. It rapidly changes from green to red, and if a waterspout draw up and re-discharge the bacterium-laden water, a shower of 'blood-rain' is no longer mysterious. Snow is sometimes coloured in a varied way by the presence of a similar organism (*Micrococcus*); which is not, however, to be confounded with the much larger *Protococcus* of 'red snow.' Bacteria are abundant in the shore-area, and also in the superficial layers of the ocean, where they play an important part in

the economy of marine life. So far as we know, they are absent from the great abysses of the deep sea.

(c) *Soil.*—Nor is soil free from bacteria. Spring-water fresh from the source carries a cargo of these micro-organisms. Pasteur found that the germ of splenic fever (*Bacillus anthracis*) occurred in great abundance in the earth round about the pits in which diseased cattle had been buried. He also found bacteria in the earthy excrement of worms. Some refer the origin of most epidemic diseases to the ascent of these deadly germs from the soil; and if this be in any way true, the danger of drying maishes, of narrowed river-beds, and of dust generally, is obvious enough. Some striking researches by M. Béchamp go to show that bacteria may lie dormant in soil for an incalculable period. A fresh piece of chalk taken from the quarry, with due care to exclude extrinsic germs, gave rise to abundant bacteria. He also discovered their presence in coal, but was unable to bring the sleeping germs into life again. It may be noted here that there is good direct evidence of the presence of bacteria in Carboniferous and Devonian deposits.

(d) *Food, &c.*—The rancidity of butter, the putrefaction of cheese, the game-flavour and high odour of meat, the yellowness and blueness of milk kept in imperfectly scalded vessels, the excessive staleness of bread, and a crowd of other unhealthy conditions in food, are largely due to the presence of bacteria. Bloody stains on bread, meat, paste, &c., have also been traced to the presence of a brightly coloured micrococcus. In the same way the bitterness, ropiness, &c. of bad wine are due to the same organisms.

(e) *In Association with Living Organisms.*—Bacteria are usually absent from healthy tissue, but they are generally present in the alimentary canal, and may assist in the decomposition of food-stuffs. They are also abundant in the pitchers of pitcher-plants, again to the advantage of their host. The micro-organisms which cause root-tubercles on leguminous plants, and are somehow able to utilise free nitrogen, are the most striking examples of directly useful bacteria. But besides the directly useful symbiotic forms, and others whose presence is indifferent, there are many which cause disease, usually by producing poisons or toxins. The counter-acting of these poisons by the artificial introduction of 'anti-toxins,' as in the case of diphtheria, is one of the most notable features of modern medicine. We may here notice that the disease-producing bacteria are found free in a great variety of circumstances—in water (e.g. bacillus of typhoid, spirillum of cholera), in the soil (e.g. germs of tetanus and quarter-evil), in air (e.g. bacillus of tubercle and anthrax), and in food, such as milk (e.g. germs of tubercle, typhoid, diarrhoea).

II. Form and Structure.—As regards the shape

Fig. 1.—Different Forms of Bacteria (after Zopf):

a, Micrococcus; b, Macrocooccus; c, Bacterium; d, Bacillus; e, Clostridium; f, g, h, i, ciliated phases; k, Spirochaeta; l, Leptothrix; m, Spirillum.

of the individual units, four principal forms may be distinguished—viz. spherical, elliptical, rod-like,

and spirally curved. It must be noted, however, that a bacterium may, as Lister and others have shown, pass from one form to another in response to different physiological conditions, that a species spherical in its young stages may be elliptical or cylindrical afterwards, or that a rod-like form, such as *Bacterium lactis*, which causes lactic acid fermentation, may become thread-like or spiral when sown in urine.

Bacteria do not, however, remain single, but reproduce by division, and the results of division may remain loosely united. (1) The spherical micrococcus and the elliptical or cylindrical bacterium always divide in one direction, and the resulting couple may remain temporarily united, or continue multiplying to form a myriad colony embedded in a jelly (zoogloea). (2) In *Bacillus*, *Leptothrix*, and *Beggiatoa*, the cells may form long cylindrical threads, and this is varied in *Vibrio*, *Spirillum*, and *Spirochæte* by the development of spiral or wavy curvature. (3) In *Sarcina*, again, the division takes place in three planes, and the result is obviously the formation, not of long chains,

Fig. 2.—Multiplication of Bacteria (after Zopf):

a, b, c, division of Coccus (*Crenothrix*); d, round zoogloea of the same; e, oval zoogloea of *Beggiatoa*; f, cubical packets of *Sarcina*; g, ramified zoogloea of *Cladothrix*.

but of cubical clumps. In the group known as *Trichobacteriaceæ*, e.g. *Crenothrix* and *Cladothrix*, the typical form is a branched or unbranched filament, segments of which separate off as swarm-cells.

Structure.—The unit mass of protoplasm which forms the bacterium individual is always inclosed in a membrane, which sometimes consists of the cellulose characteristic of the cell-walls of plants, but more frequently of a peculiar albuminoid substance which has been designated mycoprotein. This membrane may be stiff or flexible, colourless or brightly pigmented, and undergoes uniform increase in thickness. The contained protoplasm consists largely of the above-mentioned mycoprotein, and may include fat-like granules, particles of pure sulphur, grains of starchy material, and dissolved pigment often of a brilliant colour. Some of the bacterial pigments are physiologically important—e.g. *bactero-purpurin*, which enables its possessors to absorb rays of solar energy. In some cases—e.g. *tubercle bacillus*—there may be cellulose in the cell-substance, and also in the swollen cell-walls of the zoogloea stage. A few forms show a more or less typical nucleus, but in the great majority it is either absent or represented by diffuse nucleoplasm or by several chromatin granules. In most bacteria, at some stage at least, there are locomotor cilia or flagella, which issue through pores in the wall. There may be one, or two, or a tuft, or many. It is difficult to convey any idea of the minuteness of most bacteria. A large number may be lifted on the point of a needle. A micron (μ) is $\frac{1}{1000}$ of a millimetre; bacteria vary from 0.3 to 3μ . The blood-red spheres of *Micrococcus prodigiosus*, sometimes seen on bread, are 0.0005 mm. in diameter.

III. Life-history.—It is convenient to distinguish in the life-history three important events or processes—(a) increase in size and modification of

form; (b) reproduction; (c) the assumption of the resting form known as zoogloea.

(a) *Increase in Size and Modification of Form.*—As the result of abundant nutrition, the bacterium unit increases in size, and this growth necessitates division, and is associated with change of form. The minute spherical cocci usually grow into rod-like or cylindrical shapes, and these little rods divide rapidly, ranging themselves in rows to form filaments. In those filaments the original distinctness of the component units is often lost. Nutritive and other conditions, however, affect the form, both of the separate rods and of the composite filaments. Both exhibit a tendency to be more or less spirally curved. Thus wavy forms arise from the straight, and their history shows that the longer forms arising from rows of straight rods are really multicellular, whether they appear to be so or not. This modification of form is technically known as the pleomorphism of bacteria.

(b) *Reproduction.*—The more complete the degree of parasitism in fungi, the more probable is the absence of sexuality. In bacteria, the multiplication is an entirely asexual process. The absence of anything of the nature of sexual union may perhaps in part explain the infinitesimal minuteness of the individuals; and again, since the bacteria live to a certain extent bathed in waste products, the stimulating character of the medium has been regarded as a physiological substitute for the stimulus to division usually supplied by fertilisation. The process of multiplication which invariably occurs is by means of division. The coccus or rod-like form becomes somewhat elongated, a double partition wall is developed in the middle, and the two daughter cells are thus formed.

Besides this external and successive fission, another process is frequently observed in which the divisions occur in a less definite way. Spiral or other forms are seen to divide rapidly into fragments, either at once externally, or at first only internally. The rupture of the flexible filament occurs in the more passive middle portion, and each half again splits, and so on. The liberated fragments grow again to the adult size.

Another mode of reproduction is spore formation. Around a minute granule in the mother cell the protoplasm gathers and acquires a wall, or there may be several spores within one cell. As these 'endo-

Fig. 3.—Formation of Spores (after Zopf):

a, b, c, *Clostridium*, spore at free end, or at both ends; d, spores forming at certain points in chain, e.g. *Leuconostoc*; e, *Bacillus anthracis*, spores in one stretch of the filament; f, g, ciliated swarm spores.

spores are very resistant and able to live long without germinating, they are particularly effective in securing the persistence and dissemination of bacteria. When the protoplasm of an ordinary vegetative cell rounds itself off and passes into a resting stage, this is sometimes, but unfortunately, called an 'arthrospore.' Spore-formation appears to set in as a response to insufficient nutrition, as is the case in very many instances of reproductive activity. The liberated spores germinate and develop into the adult forms. Often ciliated in their young stages, they become more quiescent with increasing size. It should be clearly recognised that bacteria really multiply by division, and that spore-formation is a specialised mode of reproduction, occurring

in conditions unfavourable to vegetative growth, and often effective in insuring survival when the ordinary forms die, or in securing dissemination from one place or host to another.

(c) *Formation of Zoogloea*.—Wherever bacteria have been allowed to flourish unmolested, jelly-like flakes or clumps are found. These were formerly regarded as distinct forms and called zoogloea, but they are now recognised as a phase in the life-history. Such gelatinous clumps are often conspicuous both in size and colour; thus that of *Clostridium polymyxa* may measure more than an inch across, while the 'frog-spawn' zoogloea occurring not unfrequently in the beetroot juice used in sugar manufacture, may attain a size of more than a foot. These zoogloea consist of myriad colonies of bacteria embedded in a jelly.

IV. *Classification*.—A thorough classification of bacteria has yet to be elaborated. The multitude of forms differing in comparatively trivial points of structure, the insufficient state of our knowledge of the life-history of many genera, the difficulties involved by the abundant pleomorphism, the existence of weighty physiological differences between forms which seem otherwise absolutely alike, make a dogmatic classification at present quite impossible. In 1838 Ehrenberg distinguished four genera—(1) *Bacterium*—straight and rigid; (2) *Vibrio*—snake-like and flexible; (3) *Spirillum*—spiral and rigid; (4) *Spirochaete*—spiral and flexible; while Dujardin united the two last into one genus. In 1872 Cohn, to whom so much progress in bacteriology has been due, distinguished four distinct tribes—(1) Sphaerobacteria—globules (*Micrococcus*); (2) Microbacteria—short rods (*Bacterium*); (3) Desmobacteria—long rods (*Bacillus* and *Vibrio*); Spirobacteria—spirals (*Spirochaete* and *Spirillum*). This classification held ground for a few years, but has been abandoned for a reason which must already be obvious. In 1873 Lister was the first to hint at the fact of pleomorphism. He showed that certain forms referred to different genera and groups were really phases in

classification were shown to be successive chapters in the life-history of one species. The researches of Billroth (1874), Klebs (1875), Nageli (1877), Warming, and others, but most of all, perhaps, of Zopf, have established the prevalence of pleomorphism, and have made this fact at least certain, that whatever the final classification is to be, it must be one which takes account, not of specific facts of form, but of the whole round of the life-history, and of the sum-total of morphological and physiological properties. A commonly adopted classification is that of Fischer. He distinguishes three groups: (1) Haplobacterinae; (2) Trichobacterinae; (3) Myxobacterinae.

(1) The unicellular forms or Haplobacterinae include (a) the spheroidal Coccaceae, e.g. *Micrococcus*; (b) the rod-like Bacillaceae, e.g. *Bacillus*; and the curved Spirillaceae, e.g. *Spirillum*.

(2) The Trichobacterinae include branched or unbranched filamentous forms, whose segments separate as swarm-cells (gonidia).

(3) Quite peculiar are the Myxobacterinae, which form plasmodium-like masses and peculiar spore-forming cysts.

Another feature that may be emphasised is the way in which spores are formed. In arthrosporous bacteria, the ordinary vegetative cells become thick-walled, and as such converted into spores, e.g. *Leuconostoc*. In endosporous bacteria the spores are formed inside the cells, and invested in walls of their own, e.g. *Bacillus*.

V. *Important Forms*.—More than seven hundred species of bacteria have been recorded, and the list is being added to every year. It is also highly probable that new species are at present being evolved. It is not possible here to do more than refer to a few important forms. *Streptococcus* is a genus with numerous species, some associated with disease in men and animals—e.g. with diphtheria, yellow-fever, foot-and-mouth disease—others merely feeding on the results of pathological processes, and a few entirely unassociated with diseases of animal life. *Micrococcus* has been observed in cases of scarlatina, measles, whooping-cough, typhus, &c., but their precise rôle is not certainly determined. Hydrophobia is believed by many to be due to the presence of a micro-organism, and micrococcus has been observed in this connection. Many micrococci are apparently simply saprophytic, following and not causing pathological processes. *M. amyliovorus* has been described as the cause of 'fire-blight' on pear-trees and other plants. Many of these forms are brightly coloured, as, for instance, that species which causes the blood-red sweat in the human armpit and elsewhere.

Species of bacterium have been found associated with pneumonic disease, diphtheria, &c.; others cause fowl-cholera and other diseases of animals; and a large number have been described apart from any directly pathological connection. *Bacterium prodigiosum* forms blood-red zoogloea, and occurs on bread, paste, milk, and the like. *B. aceti* oxidises the alcohol of wine and other fruit-juices into vinegar. *B. termo*, which is so often described as an almost omnipresent organism, is apparently only a phase in the life-history of many different forms. A species of *Spirillum* is believed to be the cause of relapsing fever, and Koch has described another form—the Comma bacillus—which he has found associated with Asiatic cholera. A large number of species are known apart from disease. The frog-spawn fungus, otherwise known as *Leuconostoc mesenteroides*, is of some importance, since it sometimes invades and corrupts the beetroot juice and molasses used in sugar manufacture. *Bacillus* is a large genus with numerous formidable species associated with the diseases of men and animals. Such are the bacilli of leprosy, syphilis,

Fig. 4.—Different Phases of one Form—*Cladothrix dichotoma* (after Zopf):

a, branched form; b, one twig of the same; c, a small portion of a twig; d, this breaking up; e, f, g, progressive division into little rods, and then into cocci.

one and the same life-cycle. The mistake had been made of separating young and adult stages, and of regarding as permanent and fundamental shapes and habits which were only temporary and transitional. Till the life-history of all the forms is completely known, the same mistake in this, as in other departments, is sure in some degree to persist. What Lister suggested was in the same year even more conclusively demonstrated by Lankester. Forms belonging to different groups of Cohn's

and typhoid fever, tuberculosis, splenic fever, glanders, swine fever, &c. The bacillus of 'blue milk,' of hay-infusion, and *Bacillus septicus* of putrid albuminous fluids, may be noted as examples of forms unassociated with disease. A species of *Clostridium* is the cause of the disease of cattle known as 'black leg' or 'quarter-evil.'

A species of *Crenothrix* with long filaments is sometimes abundant enough to stop up narrow water-pipes. *Beggiatoa* occurs in various forms in sulphur springs, on sea-water, on the surface of

Fig. 5.—Different kinds of Bacteria (mostly after Koch): A, Micrococci, in drinking-water; B, in splenic fever; C, in cholera (Koch); D, in splenic fever (in thread-form, and with incipient spores); E, *Spirillum*, from putrefaction; F, *Spirochete*, from the teeth; G, in relapsing fever, from blood; H, different forms of cholera microbe (Koch).

marshes, &c. The best-known species has a peach-blossom red colour. *Leptothrix buccalis* occurs abundantly in the mouth, and is apparently associated with the decay of teeth.

Cladotrix dichotoma (fig. 4) occurs more abundantly than any other in water containing organic matter. Various diseases of plants—e.g. hyacinths, cucumbers, and cabbages—have been shown to be bacterial.

VI. Work of Bacteria.—That bacteria are responsible for all sorts of organic decomposition or putrefaction was long ago established. They are the universal scavengers of our earth. Further research has shown that they play their part in various fermentative processes—e.g. in tanning, tobacco-curing, and ensilage. They have to do with various 'diseases' of milk and wine, and they are often deliberately used to improve the flavour of butter and cheese. Very often they produce poisonous ptomaines in the flesh of animals used for food, very often they simply increase its palatability. They are usually absent from normal tissue, but they are normally present in the alimentary canal, and are doubtless in many cases of real service. They may produce light—e.g. in the phosphorescence of dead fish; and they may produce heat enough to induce spontaneous combustion in hay-ricks or in hop-granaries. By decomposing cellulose certain anaerobic forms evolve marsh-gas in the stagnant pool; by oxidising processes other bacteria have assisted in forming deposits of bog-iron ore, ochre, and manganese ore. By producing often fatal 'toxins,' they have played a very important part as eliminative or selective agents in the history of animals and of man. In short, the work of bacteria is extraordinarily many-sided:

they produce gas and solid deposits, acids and salts, ferments and toxins, heat and light, and are inextricably bound up with the bundle of life. (See the articles FERMENTATION, PUTREFACTION, PHOSPHORESCENCE, PTOMAINES; and for the germ theory of disease, GERM, ANTISEPTICS, ANTITOXIN.)

Of fundamental importance is the rôle they play in the circulation of matter. In the very simplest case, the agency of putrefactive bacteria brings about the decomposition of a dead animal, and the disruption of the nitrogenous materials yields ammonia, nitrates, and the like, which may be again utilised as food for plants. But the whole story of the chemical transformations which bacteria effect—a story still very imperfectly known—is extremely intricate. Thus there are *nitrosobacteria*, which can oxidise ammonia to nitrous acid and nitrites, which can in the dark build up organic matter from carbon dioxide and ammonia. There are *nitrobacteria*, which can oxidise nitrites and produce nitric acid and nitrates. There are *denitrifying* bacteria which change nitrates into nitrites, and nitrites into ammonia and free nitrogen. And there are other bacteria which live in partnership with the roots of leguminous plants and fix the free nitrogen of the air. The way in which this is effected remains obscure. Nitrification (q.v.) is the subject of a separate article.

Similarly, if we fix our attention on sulphur, we find that when bacteria decompose the cellulose of decaying plants in a swamp, carbon dioxide and marsh-gas are liberated; if there be calcium sulphate in the water the nascent marsh-gas induces the formation of calcium carbonate and sulphuretted hydrogen. The latter may be oxidised by sulphur-bacteria which store sulphur in their cytoplasm; this sulphur may be oxidised to yield sulphuric acid, and, in the presence of calcium carbonate, sulphate of lime may again result. Thus the circle is completed, and there are many of these circles.

We cannot close our reference to the work of bacteria without referring to the fact that they often work together, hunting, as it were, in couples—e.g. *Bacterium coli* and *B. denitrificans*—and accomplishing what neither could do alone. On the other hand, it is equally important to note that different bacteria are often antagonistic. This fact is at the basis of some of the modern methods for dealing with sewage (see SEWAGE, FILTER). Even in the realm of the infinitesimally small there is a struggle for existence—between bacteria and bacteria, between bacteria and protozoa, between bacteria and the animal's bodyguard of phagocytes.

VII. Methods of Research.—Besides the usual apparatus of any well-equipped laboratory for the study of minute structures and organisms, a number of special appliances are required for the successful investigation of bacteria. Thus, since the intrusion of germs other than those which are the specific object of research is a constant danger, there must be some means for sterilising the tubes, tools, media, &c. This is generally done by means of a steam or hot-air steriliser, in which all the extrinsic germs are killed off. Incubators are also used for purposes of cultivation. The bacteria obtained in endless ways may be examined as they are, or stained with reagents to bring out the individual structure, or, since the life-history is all-important, left to grow, and watched at their successive stages. They used to be left in some sterilised fluid, such as broth, blood-serum, urine, milk, or Pasteur's fluid, and allowed to grow in test-tubes, or other vessels, plugged with cotton-wool. It is, however, exceedingly difficult to get a perfectly pure fluid medium, nor was it possible in such cases to isolate

the different kinds of bacterium which might be present. In view of this, Koch introduced the method of cultivation on sterile solid media. Sterile nutrient gelatine, or some such substance, is liquefied in a tube and inoculated with the bacteria in question. These are distributed through the fluid, which is then poured out on a plate of glass and left to solidify. The various bacteria can no longer move about and mingle with one another, but are fixed to one spot, where they develop. The resulting fixed colonies can thus be studied without confusion. Slices of sterilised potatoes are also very frequently used as solid media for the cultivation of bacteria. Finally to elucidate the relation of a micro-organism to a given disease, it is necessary not only to have obtained it from an organism suffering from the said disease, but it is imperative that some of a pure cultivation be introduced into a healthy organism, to see whether it does or does not cause the disease. The inoculation may be brought about by inhalation, or along with the food, or by injection in some form or other.

How such methods have, in the hands of investigators like Pasteur and Koch, resulted in discoveries of profound importance, not only to a scientific theory, but to the practical amelioration of life, will be discussed in other articles.

See ALGÆ, ANTISEPTICS, FERMENTATION, FUNGI, GERM THEORY, INFECTION, NITRIFICATION, PUTREFACTION, SCHIZOMYCETES, SEWAGE, &c.; Klein's *Micro-organisms and Disease* (1886); Löffler's *History of Bacteriology*; and manuals of Bacteriology by De Bary (1887), Truetsart (1886), Crookshank (1887), Steinberg (new ed. 1896), Sins Woodhead (1891), Gunther (3d ed. Leip. 1893), G. Newman (1899), Hueppe (trans 1900), A. Fischer (trans. 1900), Muir and Ritchie (new ed. 1904).

Bactria, a province of the ancient Persian empire, lying north of the Paropamisus (Hindu Kush) Mountains, on the Upper Oxus. A northern branch of the same range separated it from the Sacæ, and it had Sogdiana on the north and Ariana on the south. It thus corresponded pretty nearly with the modern Balkh. Here many scholars locate the original home of the Aryan or Indo-European family of nations (see ARYANS). Its capital, Bactra or Zariaspa, was also the cradle of the Zoroastrian religion. Originally a powerful kingdom, it maintained its independence until its subjugation by the great Cyrus about 540 B.C., when it became a satrapy of the Persian empire. It was included in the conquests of Alexander, and formed a part of the kingdom of the Seleucidæ until the foundation, about 256 B.C., by Diodotus, of the Greek kingdom of Bactria, which extended to the Indus, and which after a long struggle was overthrown by the Parthians. Numerous coins with Greek legends have been found in the *topes* or burial-places to the north-east of Kabul. See also ASOKA and ALPHABET, and a history by H. G. Rawlinson (1913).

Bactrites, a genus of fossil Ammonoidea, with a straight shell, and indented but not ramified septa. The genus is characteristic of the Devonian.

Baculites, a genus of the family of Ammonoidea, differing from the true Ammonites (q.v.) in the perfectly straight form of the shell, which tapers to a point, and is either round or compressed. The species, like the other Ammonoidea, are

Baculite, all fossil. Baculites are characteristic of the chalk, and appear to have existed only towards the expiry of the period over which the existence of the Ammonoidea extended.

Ba'cup, a municipal borough and manufactur-

ing town of Lancashire (since 1918 part of Rossendale parliamentary borough), 6 miles N. of Rochdale. Besides many churches of all denominations, the oldest dating from 1788, it has a mechanics' institute (1846, enlarged 1870), a market-hall (1867), a very large co-operative store, &c. Bacup was constituted a municipal borough in 1882. Cotton-spinning and powerloom-weaving are the staple industries; and there are also dye-works, brass and iron foundries, and vast stone quarries. Coal-mines are worked in the neighbourhood. Pop. (1798) 1426; (1861) 10,935; (1871) 17,199; (1881) 25,033; (1921) 21,256.

Badagry, a small port of Nigeria, on the Slave Coast. At one time it carried on a large slave-trade, and had 10,000 inhabitants. It was from this place that in 1825 Clapperton and Lander started on their expeditions to explore the African interior.

Badajoz, capital of the Spanish province of the same name, is built on a slight hill crowned by a Moorish castle, on the left bank of the Guadiana, crossed here by a stone bridge of 28 arches. It is but 5 miles from the Portuguese frontier, and is 174 miles from Lisbon, and 315 from Madrid. The see of a bishop, it has an old cathedral built like a fortress, with paintings by Cerezo and Morales. Its fortifications are obsolete; its monasteries have been secularised, and some of its nunneries closed. Its chief articles of manufacture are hats, soap, coarse woollens, leather, and pottery. It has also a large trade in cattle. Pop. 33,000. Badajoz was the *Pax Augusta* of the Romans, the *Bax Augos*, *Bathalyus* of the Moors. As one of the keys of Portugal, it has often been a place of importance in war. It was besieged in vain by the Portuguese in 1660, and again by the allies, in the Spanish War of Succession, in 1705. During the Peninsular war, Badajoz was besieged by the French in 1808, and in 1809, and again in 1811, when it surrendered, March 11, to Soult. It was thrice besieged by the English; first on April 20, 1811, next in May and June, and thirdly in the spring of 1812, when Wellington captured the city by storm, on the night of April 6, after a murderous contest, and a loss during the twenty days' siege of 72 officers and 963 men killed, and 306 officers and 3483 men wounded. There were two days of pillage, and deplorable excesses. The province has an area of 8450 sq. m.; pop. 650,000. See ESTREMADURA.

Badakhshan, a territory of Central Asia, lying between 36° and 38° N. lat., and 69° and 72° E. long., with the chain of the Hindu Kush on the S., and the Oxus, or Amu Darya, on the N. It is drained by the Kokcha, a head-stream of that river, and is famous throughout the East as a picturesque hill-country diversified with woods, rich pasture, and fertile, well-cultivated valleys, its surface varying from 500 to 15,600 feet above sea-level. Eastern travellers speak with rapture of its orchards, its fruits, flowers, and nightingales. It is rich too in mineral wealth—iron, rubies, and lapis-lazuli. Marco Polo was here in 1272-73; and Captain John Wood in the winter of 1837-38. Matveyeff saw part of the country in 1878. Faizabad (q.v.) is the capital. The inhabitants are largely Tajiks, an Aryan race speaking Persian. They are Mohammedans—Shiites in the mountains, and Sunnites in the plains. Their number is estimated at 100,000. The people of Badakhshan seem to have been always under the immediate rule of their own chiefs, at the head of whom is the Amir. They have generally, however, formed part of some great Asiatic empire. Thus, in the 18th century, Badakhshan belonged to the empire of Nadir Shah, after whose death it became subject to the Afghans. In 1823, however, the Uzbegs,

under Murad Beg, taking advantage of the disturbed state of Afghanistan, defeated the tribes of Badakhshan in a pitched battle; and two years after, their subjection was completed. The conquerors treated them most harshly, demolishing their towns, and either selling them as slaves, or carrying them off to people the unhealthy swamps of Kunduz. On Murad's death in 1845, Badakhshan passed to another Uzbek. The Afghans, however, soon reasserted their claims, and in 1859 were about to annex Badakhshan, when the Amir agreed to pay an annual tribute. In 1863 Jahander Shah, the Amir of Badakhshan, was superseded by Mahammed Shah. This gave rise to a struggle which ended in Jahander's nephews acquiring dominion by means of Afghan help. In 1873 Britain and Russia fixed a frontier between Badakhshan and Afghanistan. In 1907 Russia declared that Afghanistan, including Badakhshan, is outside the sphere of Russian influence. Badakhshan is sometimes made to include Wakhan, on the Upper Oxus, between Badakhshan proper and the Pamir Steppe (see PAMIR, and the map at AFGHANISTAN).

See Yule's *Marco Polo* (1871); Wood's *Journey to the Source of the Oxus* (new ed. 1872); Vambéry's *Central Asia* (1874); Yates's *Northern Afghanistan* (1888).

Badalona, a seaport in the Spanish province of Barcelona, 5 miles NE. of that town by rail. The fertile plain around is covered with gardens and orange-groves; the town has shipbuilding and a large glass-work. Pop. 28,000.

Badderlocks, also sometimes HONEYWARE or HENWARE (*Alaria esculenta*), an olive-coloured seaweed belonging to the *Phaeosporae* (see SEAWEED), and allied to the common *Laminaria*, which grows on rocks in deep water on the shores of Britain, Iceland, and the northern parts of Europe. It has a short cylindrical stem with lateral spore-bearing processes, and a membranous olive-green frond of 2-12 feet long, with a stout midrib. This midrib, together with the 'fruits', is eaten by the inhabitants of the sea-coasts of Iceland, Denmark, Scotland, Ireland, &c., and is said to be the best of the esculent algae. The name is supposed to be a corruption of Balder-locks. See BALDER.

Baden, a free-state (formerly grand-ducal), situated in the south-western corner of the German commonwealth, between Alsace-Lorraine and Württemberg, and separated from Switzerland by the Rhine. Its area is 5817 sq. m.—considerably less than that of Yorkshire.

Surface and Hydrography.—Physically, Baden falls into two divisions—the western plain, lying along the right bank of the Rhine, and the eastern highlands; the former occupying about a sixth of the whole duchy. Of the mountain districts, the Schwarzwald, or Black Forest (q.v.), is the most important, and attains a maximum altitude of 4903 feet. The Neckar highlands are lower, and north of the Neckar Valley the Odenwald begins. Southward rise the extensive plateaus of the German Jura. Being drained by the Rhine and the Danube, Baden belongs to the basins of two opposite seas; the sources of the Danube, however, drain only some 350 sq. m. From Basel to below Mannheim, the Rhine is the sole and the natural boundary. Its chief tributaries on the Baden side are the Neckar, the Murg, and the Elz. On the north-east the Baden territories are bounded by the Main. Except a part of the Lake of Constance, Baden has no lake of importance.

Produce.—As the difference between the highest and lowest points of Baden amounts to something like 4500 feet, there is naturally a great variety of temperature. The Rhine Valley of Baden is one of the warmest and most fruitful districts, not only of Germany, but of Europe. Grain, vegetables of all

sorts, tobacco, hemp, rape, poppy-seed, &c. are grown, and a large quantity of wine is produced. The rearing of cattle is carried on to a large extent. Honey is also an important product.

Minerals.—The principal minerals are the products of the limestone quarries and of the clay and gravel pits, and gypsum, largely used for pavements. Coal, zinc, and manganese are found, and the production of salt and soda is important. Iron, lead, silver, and nickel were formerly wrought in the Black Forest, but the industry has become almost unprofitable, and now receives little attention. Baden is rich in mineral springs; as many as sixty are enumerated, and there are a great number of much-frequented watering-places, as Baden-Baden, Badenweiler, and others.

Manufactures, &c.—The manufactures of Baden include ribbons and cotton fabrics, paper, leather, rubber goods, chemicals, machinery, tobacco, chicory, sugar, beer, trinkets, mirrors, wooden clocks, and straw-plaiting; the last two are characteristic of the Black Forest, and known all over the world. The manufactures of jewellery in Pforzheim are the most important in Germany. The chief articles of export are wine and timber.

Population, Religion, Education.—The population of Baden in 1880 amounted to 1,570,196, and in 1919 it had increased to 2,208,508 (379 per sq. m.). Karlsruhe (pop. 140,000) is the capital. Other principal towns are Mannheim (230,000), Freiburg (88,000), Pforzheim (74,000), Heidelberg (60,000), Constance or Konstanz (30,000), Baden-Baden (25,000), Offenburg, Bruchsal, Durlach, Loriach, Weinheim, Lahr, Villingen, Rastatt, and Singen (all above 10,000). The Roman Catholics in 1910 numbered 1,270,782; Protestants numbered 821,228; and Jews, 25,900. The school-system is excellent; and Baden has a Protestant university at Heidelberg and a Catholic university at Freiburg.

Government.—The Grand-duke Friedrich II. abdicated in November 1918, and Baden was proclaimed a republic. A constitution was drawn up in January 1919 by a National Assembly. The free-state of Baden was declared a component state of the German republic. All privileges of birth and sex were abolished. The legislature is elected, on the system of proportional representation, by all persons over twenty-one years of age. There is no president. The referendum and initiative have been adopted. The cabinet of six members is elected by the legislature. Religious instruction in schools is compulsory, but there is no state church.

History.—The earliest inhabitants of Baden known to history were the Alemanni. These fell under the dominion of the Franks, and the dukedom of the Alemanni was abolished in 748 by Pepin the Little. In the 11th century, a Duke Berthold built the castle of Zähringen in Breisgau, and a descendant of his second son took the title of Margrave of Baden, and became the ancestor of the still flourishing House of Baden. He died in 1130. The present capital, Karlsruhe, was built in 1715 by the then margrave, Charles III. It is to his grandson, Charles Frederick, who succeeded in 1746, that Baden owes considerable accessions of territory and political importance. By favouring the policy of Napoleon, and joining the Confederation of the Rhine, he doubled his possessions in extent and population, and acquired successively the dignity of elector and the title of grand-duke. In 1811 he was succeeded by his grandson, who, after the battle of Leipzig, seceded from the Confederation of the Rhine, and (1815) joined the German Confederation, in which Baden held the seventh rank.

The Grand-duke Charles granted (1818) the charter which forms the basis of the present constitution. Charles was succeeded in the same year

by his uncle Ludwig, who was inclined to absolutism, and who, dying childless (1830), was succeeded by his brother Leopold. The known liberal tendencies of this prince promised at first a new life to constitutional rule; but the tide of reaction soon seized the government, and a fluctuating contest between a reactionary cabinet and a growing opposition was carried on till 1846, when the constitutional Bekk was made minister of the interior, and liberalism thus placed at the helm. The ninth parliament met (December 1847) under the most friendly and promising auspices; when the French revolution (February 1848) suddenly called the radical party into the most violent activity. Not satisfied with a multitude of liberal measures passed by the legislature, the revolutionary leaders, Hecker and Struve, aimed at establishing a republic, and stirred up an insurrection. The troops having sided with the insurgents, the grand-duke fled, and a Constituent Assembly was called (May 1849). The duke had recourse to Prussian aid, and after several battles, was reinstated on his throne (July 1849); but the reactionary tendency was less marked in Baden than in most other German states. In 1859 a great conflict between the state authorities and the Catholic hierarchy ended in favour of the latter; two years later a definite settlement recognised the complete independence of the church, a privilege extended also to the Protestant Church of Baden. In 1864 liberal reforms reorganised the administrative and judicial systems of the country. In the conflict between Prussia and Austria in 1866, Baden took her place with the enemies of Prussia, and her troops fought in two ineffective battles against the Prussians. At the peace, Baden had to pay a heavy war indemnity, reorganise her army on the Prussian model, and in 1867, enter the North German Confederation. In 1870-71 the troops of Baden fought with distinction in the French campaign, and the grand-duchy became a part of the restored German empire. The Old Catholics were afterwards recognised. The Grand-duke Friedrich I. (1826-1907) was succeeded by his son Friedrich II. (1907-18). The republic was set up in 1918. See GERMANY.

Baden, a town and fashionable watering-place in the Swiss canton of Aargau, on the left bank of the Linmat, 14 miles NW. of Zurich by rail. It has a population of 6000, and its sulphur-baths, which were known to the Romans as *Thermæ Helveticæ*, yearly attract some 20,000 visitors. Their temperature is as high as 117° F. Baden, from the 15th to the beginning of the 18th century, was the seat of the Swiss diet.

Baden-Baden, a town in the German land of Baden, situated in the pleasant valley of the Oos, at the edge of the Black Forest, 8 miles from the Rhine, and 23 SSW. of Karlsruhe by rail. Population, 25,000; but its visitors during the season, which is at its height in July and August, are often four times the number of the settled population. It is chiefly celebrated for its medicinal springs, which were known in the time of the Romans, Baden-Baden claiming to have been founded by Hadrian in the 2d century A.D. Numerous Roman antiquities have been found in the neighbourhood, and are preserved in a museum here, and remains of a vapour-bath and dungeons of the same period were discovered in laying the foundations of the new castle. Its 13 hot springs have a temperature of 115° to 150° F., are impregnated with iron, magnesia, and lime, with sulphuric and carbonic acids, and are especially recommended in chronic cutaneous diseases, gout, rheumatism, and stomach complaints. The chief spring (*Ursprung*) discharges in 24 hours about 4200 cubic feet of water. The reputation of Baden-Baden as a

bad received an increase from the visit of a number of French emigrants in the end of the 18th century, and from 1804 the grand-ducal family did everything possible to make the place more popular. So early as 1815 the annual guests numbered about 2500, and from that time its fame as a fashionable resort yearly assembled from all parts of the world so many guests of such a class that in wealth, gaiety, and luxury Baden-Baden might vie with the capitals of Europe. The season lasts from May to September. Even the winter season, which was started in 1872, keeps quite a number of strangers there. The beauty of Baden-Baden has been largely due to its gaming-tables, once the most renowned in Europe, but closed with the rest of the licensed German gaming-houses in 1872; besides paying a rent of over £14,000, they used to devote a like sum yearly to the beautifying of the promenades and public gardens. To the tables was devoted part of the *Conversationshaus* (1824), now the principal resort of visitors, including magnificently decorated concert and ball rooms, and a restaurant. All around are carefully kept pleasure-grounds, leading on one side to the *Trinkhalle* (1842), or pump-room, with large frescoes on legends of the Black Forest. The principal baths are the Friedrichsbad (1877, for men in summer and both sexes in winter) and the Empress Augusta bath (1892, for women in summer). There is a theatre (1862), also a technical school here. The drives and walks around the town are beautiful. The picturesque ruins of the 'old castle' still crown the summit of the Schlossberg, and command a magnificent view of the Rhine valley from Spires to Stiasburg. Lower down the hill, and directly overlooking the town, is the 'new castle' (1479), destroyed, like the old, by the French in 1689, but restored, and till 1918 the summer residence of the grand-duke. There is an English church in the town, built in 1868, and a Greek chapel for Russian visitors since 1882. Wood-carving is a local industry. The town was known to the Romans as *Civitas Aurelia Aquensis*. See besides the guidebooks, works named at MINERAL WATERS.

Baden bei Wien (i.e. 'Baden near Vienna'), a much-frequented watering-place of Austria, on the Schwechat, 16½ miles S. by W. of Vienna by rail. It was the *Aquæ Pannoniæ* of the Romans, and is still famous for its warm mineral springs, which are visited during the season by upwards of 10,000 persons. The springs are sulphurous, with much carbonic acid gas, have a temperature of 79° to 104° F., and are good for skin diseases, gout, and rheumatism. Fine bathing establishments were erected between 1848 and 1877. Pop. 21,000.

Badenoch, a Highland district in the south-east part of Inverness-shire, 45 miles long by 19 broad, bounded by Lochaber, Athol, Braemar, and Moray, and traversed by the Spey. It is much covered with forest, and is chiefly composed of gneiss rock, with a little granite. It was a lordship, held from 1230 by the eldest branch of the great house of Comyn, on whose forfeiture in 1306 Bruce bestowed it on his nephew Randolph. In 1371 King Robert II. gave it to his son, 'the Wolf of Badenoch,' on the failure of whose descendants it reverted to the crown, which, in 1452, granted it to the Earl of Huntly.

Baden-Powell. See POWELL.

Badge (etymology unknown, either from Lat. *bagulo*, 'I carry,' or connected with *badger*), a figure or emblem used, with or without a motto, as the distinctive cognisance of a family. Family badges, which originated in the infancy of heraldry, and continued in favour down to the 15th century or later, were sometimes taken from a

bearing in the family coat, and sometimes bore allusion to the owner's name, estate, or office. While the banner, shield, and jupon of the knight displayed his armorial coat, and the crest surmounted his helmet, the badge glittered on his standard and penoncelle, and on the sleeve, breast, or back of his retainer, and occasionally helped to decorate his armorial seal. Devices, otherwise analogous to badges, differed from them as belonging to individuals, not families. The *fleur-de-lis*, as the badge of the kings of France, dates as far back as the reign of Louis VII. (1137-1180). Of the English royal badges, which have varied much, a few may be enumerated. A star between the horns of a crescent appears on the great seals of Richard I., John, and Henry III., and a castle (allusive to his descent from the house of Castile) on that of Edward II. An ostrich feather was used by Edward III.; and the same cognisance was borne argent by the Black Prince, and ermine by John of Gaunt. None of the sovereigns of the house of Plantagenet were in the habit of using the *planta genista*, commonly known as the badge of that house; but a livery collar of broom pods with a white hart pendant appears in the portrait of Richard II. at Wilton. Of the famous rival cognisances of the houses of York and Lancaster, the red rose was first adopted by Henry IV. and the white by Edward IV. The Tudor sovereigns used the red and white roses variously united, per pale, quarterly, and one within the other. The thistle, as the badge of Scotland, seems to have been first used by James III.; and on the union of the crowns, the rose and thistle were used dimidiated and crowned. The royal badges of the United Kingdom as now in use (settled by sign-manual in 1801) are—a white rose within a red, crowned, for England; a thistle proper, crowned, for Scotland; a harp or, stringed argent, and a trefoil vert, for Ireland; and, on a mount vert, a dragon passant, wings expanded, and endorsed gules, for Wales. Among the best known badges of the English nobility are the crescent of the Percies, the buckle of the Pelhams, the bear and ragged staff of the Earls of Warwick, and certain intertwined cords known as knots, the forms of which have sometimes been suggested by the initial letter of the name or title of the bearer. In the Wake and

1, Wake and Ormond knot; 2, Lacy knot; 3, Bowen knot; 4, Hensage knot; 5, Dacre badge.

Ormond knot (fig. 1), it is not difficult to trace a *W* and two *Os*. The Bourchier knot, as seen on the tomb of Archbishop Bourchier at Canterbury, bears a resemblance to two *Bs*, and the Stafford knot to two *Ss*. The Lacy knot (fig. 2) contains within it a rebus on the four letters of the name 'Lacy.' As examples of the badges of two different families entwined by a knot and used by the descendants of both, are the badge of the Dacres (fig. 5), combining their own escallop-shell with the ragged staff of Neville; and that of Edward, Lord Hastings, uniting the garbe of the Peverells with the sickle of the Hungerfords.

It has been the usage of the Highland clans to appropriate certain plants, chiefly native, as their badges, common heath being the badge of the Macdonalds, bell-heather of the Macdougals, holly of the Mackenzies and Macleans, box of the Macintoshes and Macphersons, fern of the Chisholms, fir clubmoss or wild myrtle of the Campbells, &c.

The term badge is also applied to the distinctive decoration of an order of knighthood. Badges of this description are noticed in the separate articles relating to the different knightly orders; those of baronets in the article *BARONET*.

Marks of distinction used in party warfare, and devices adopted by clubs or associations, are sometimes in loose popular language called badges. Cockades are the subject of a separate article. See also *DEVICE*, *CREST*, *HERALDRY*.

Badger (*Meles*), a genus of carnivores of the *Mustelidae* or Weasel and Otter family. The Skunks (*Mephites*), Sand-bears (*Arctonyx*), American Badgers (*Taxidea*), Ratels (*Mellivora*), &c., are closely related genera in the same sub-family as the Badger (*Melidae*). Badgers, like the rest of the family to which they belong, are almost quite plantigrade—i.e. they walk on the whole

Badger (*Meles vulgaris*).

sole of the foot, and not merely on the fore part of it. The body is thus brought nearer to the ground than it otherwise would be from their length of limb. The lower jaw is locked into its socket in a very remarkable way, which explains their tenacious grip. The head is long, with a pointed muzzle; the tail short; the skin very thick, loose, and tough; the hair long. Both ears and eyes are small. The gait is slow, the habits nocturnal and solitary. There are five toes on each both of the fore and hind feet, and the feet are peculiarly adapted for digging and burrowing. A peculiar characteristic of the badgers is the possession of a bag beneath the tail, for the secretion of a peculiar substance, of a disagreeable odour, which is supposed to be of use in directing the sexes to each other in their solitary wanderings.—The Common Badger (*M. taxus* or *M. vulgaris*) is the only bear-like quadruped now found in the British Islands, and that only rarely. It is widely diffused over Europe and the middle parts of Asia. The colour is grayish brown, verging to red above and black beneath; the head white, with a longitudinal black band on each side; the body long but robust, in size about equal to that of a small fox, the hair coarse and reaching to the ground as the animal walks. The average length is 2 feet 6 inches, and the height at the shoulder 11 inches. It haunts the gloomy recesses of woods, or thick plantations on the sides of hills, and digs for itself 'a deep and well-formed domicile, consisting of more than one apartment, the single entrance to which is by a deep, oblique,

and even tortuous excavation.' In such an excavation as this, the animal sleeps during the day and through the winter. It uses its nose in digging, and scrapes with the fore-paws, flinging the earth as far back as possible, and when the accumulation is considerable, pushing it away by means of the hind-feet. The habits of the badger are extremely cleanly. It is one of the most perfectly omnivorous of animals, in a wild state as well as in confinement; fruits, roots, beech-mast, eggs, young birds, small quadrupeds, frogs, snails, worms, and insects, equally constitute its natural food. For the sake of the larvae of wasps and wild bees, it even ventures to dig up their nests, its hide being impervious to their stings. It is often caught by digging, or by placing a sack in the mouth of its hole, when it is out at night. Dogs sent into the hole are often foiled by the earth which the animal throws back upon them, to block up their way, nor is it easy for a dog to contend with it, owing to the great strength of its legs and jaws. A barbarous sport, called badger-baiting, or *drawing the badger*, was formerly common, but has been prohibited by act of parliament since 1850. A badger kept in a barrel was assailed by dogs, and at last, yielding to superior numbers, was dragged out, upon which it was released, and allowed to go back to its den, to recover itself, and be baited again, which happened several times daily, when the badger was kept as an attraction to a public-house of the lowest sort. The verb to *badger*, expressive of persevering annoyance by numerous assailants, was originally employed with reference to this practice. The flesh of the badger is said to be very agreeable, particularly when cured like hams. It is usually fat, like that of most sluggish heavy animals. In China it is much used for food. The badger is easily domesticated when taken young, and becomes very tame. In Scotland and the north of England, a badger is still called a *Brock*, its Anglo-Saxon name, preserved in the name of some places; in some parts of England it is termed a *Grey*. The Indian Bhalu-soor (i.e. Bear-pig), or Sand-bear (*Arctonyx collaris*), closely resembles the badger, but is taller, and has a more hog-like muzzle, and a longer tail. Its habits and its food are very similar, and when attacked, it likewise defends itself with great vigour. It is chiefly found in hilly districts.—The American Badger, or Taxel (*Taxidea americana*), is a distinct, more carnivorous genus, differing in dentition and in some features of the skull. It chiefly preys on small animals, such as marmots, which it pursues into their holes in the sandy plains near the Missouri and the Rocky Mountains. In its pursuit of the smaller quadrupeds upon which it feeds, it enlarges their burrows, and renders some parts of the plains dangerous to persons on horseback. Its prevailing colour is hoary gray in winter, yellowish brown in summer, and under parts generally yellowish white; a white stripe runs from the nose over the forehead to the neck. The hair becomes not only very long but woolly in winter.—The burrowing powers of this animal are extraordinary. It sometimes makes burrows 6 or 7 feet deep, running under ground to a length of 30 feet. See Alfred Pease, *The Badger* (1898).

Badger Dog. See DACHSHUND.

Badghis, a region north of Herat, comprising the country between the Murghab and the Hari-rud rivers, as far northward as the edge of the desert. It lies just to the south of the boundary line between Afghanistan and the Russian territories, as defined in 1857.

Badia-y-Lablich, DOMINGO, an enterprising traveller, born at Barcelona in 1766. Early smitten with the love of travel and adventure, in 1801 he

crossed to Africa, disguised as a Mussulman, under the name Ali-Bei. From his youth he had been a devoted student of Arabic, and his knowledge of the manners and customs of the people was so intimate that he could escape detection, while to make his conformity complete, he had even circumcised himself. His tact and talents gained for him such esteem that he was invited to the court of the emperor of Morocco. After a two years' residence in Morocco, he set out on a pilgrimage to Mecca, and travelled through Barbary, Greece, Egypt, and Syria, meeting everywhere a kind reception. At the holy city of the Moslems he took his part duly in all the solemn rites, and has the distinction of being the first Christian that had visited it since the institution of Islam. In 1807 he returned to Spain, attached himself to King Joseph, and was appointed in 1812 Prefect of Córdoba; but on the fall of Napoleon's power two years later, he was compelled to leave the country. He went to Paris, where in 1814 he published an account of his travels under the title *Voyage d'Ali-Bei en Afrique et en Asie*. His work was translated into most of the European languages. Four years after the publication, he set off on another journey to the East, but died in Syria, 30th August 1818.

Bad Lands. See DAKOTA, WYOMING.

Badminton, the seat of the Duke of Beaufort in the south of Gloucestershire, 7 miles E. of Yate Junction. It is a stately Palladian edifice of 1682, with a fine park. From it have been named a kind of claret cup, and a game, a predecessor of lawn tennis, played with a shuttlecock instead of a ball. The 'Badminton Library' is a series of works on the principal sports.

Badrinath, a peak of the main Himalayan range, Garhwal district, United Provinces, India, 23,210 feet above the sea. A shrine of Vishnu stands on one of its shoulders at a height of 10,400 feet, about 56 miles NE. of Srinagar. This temple overhangs a sacred tank, supplied from a thermal spring. As ablution in these waters is held to cleanse from all past sins, Badrinath is a grand resort of pilgrims, and a number of villages have been assigned for the support of the temple.

Bæda. See BEDE.

Baedeker, KARL, a German publisher, born in 1801 at Essen, where since 1797 his father had carried on the business of printer and bookseller. He himself started in business in 1827 at Coblenz, where he died, October 4, 1859. He is best and everywhere known as the originator of a series of admirable guidebooks. With Murray's 'Handbooks' for their pattern, the German works, in the course of successive editions, have been so improved and entirely rewritten, that they have come in most essentials to equal, and in some to surpass their models; and now the guides are published in the principal languages of Europe. The business was removed in 1872 to Leipzig, carried on under the son of the founder. The first guidebook published by Karl Baedeker was a small book on the Rhine, of which in 1839 he produced a third edition entirely rewritten by himself. In the 20th century 'Baedeker' had become a synonym for guidebook, and there are Baedekeis not merely for the principal European countries, but for Palestine and Syria, the United States, and Canada.

Bael, or BHEL. See ÆGLE.

Baëna, a Spanish town 25 miles SSE. of Córdoba, with a trade in grain and oil. In the castle here, Pedro the Cruel murdered the Moorish king of Granada with all his train. The castle belonged to Gonsalvo di Cordova. Pop. 18,000.

Baer, KARL ERNST VON, a distinguished Russian naturalist, who contributed very largely

to the progress of natural science, especially of embryology, was born February 29, 1792, in Esthonia. During 1810-14 he studied medicine at the university of Dorpat, but in 1814 studied comparative anatomy in Wurzburg. In 1817 he went to Konigsberg, where, two years after, he was appointed professor of Zoology, and charged with the organisation of the zoological museum. In 1834 he was called to St Petersburg, and was soon known as one of the most active members of the Academy. In 1837 he visited Nova Zembla; and in 1851-56 he devoted much time and study to the fisheries on Lake Peipus, the Baltic, and the Caspian Sea, publishing a large work thereon, and suggesting many improved methods. He specially applied himself to embryology; and to his laborious investigations we owe most valuable discoveries in regard to the development of animal life. Beginning with his *Epistola de Ovi Mammalium et Hominis Genesi* (Leip. 1827), he still further elucidated this subject in a great work on development of animal life from its first germ (*Entwickelungsgeschichte*, 1828-37-38), and one on the development of fishes (1835). In 1864 the fiftieth year of his doctorate was celebrated by the Esthonian nobility, at whose expense a splendid volume was published, containing Baei's autobiography. He died 28th November 1876. His works are distinguished by lucidity as well as keen observation and brilliant speculation.

Bayer, ADOLF VON (1835-1917), organic chemist, born at Berlin, was a pupil of Bunsen and Kekule, became professor at Strasburg in 1872, at Munich in 1875. An influential teacher, he did much research, notably in the synthesis of indigo.

Baeza, a handsome old town of Spain, in the province of Jaen, 9 miles from a station of its own name, this being 160 miles S. of Madrid. The *Beatia* of the Romans, and the seat of Moorish khalifs and kings, with 150,000 inhabitants, it never fairly recovered from its sack by the Castilians in 1228. Its principal buildings are the quondam university (1533) and the oratory of St Philip de Neri. Pop. 15,000.

Baffa. See PAPHOS.

Baffin, WILLIAM, navigator and discoverer, is believed to have been born in London about 1584; but the earliest known fact regarding him is that he sailed in 1612 as pilot of the *Patience* from Hull, on a voyage of discovery to Greenland. In 1613-14 he served in the Spitsbergen whale-fishery, and he wrote an account of this and his previous voyage. In 1615 he took service with a company as pilot of the *Discovery* in search of a North-west Passage, and made a careful examination of Hudson Strait; his recorded latitudes and notes of the tides are in remarkable agreement with those of a later date. In the following year, with Captain Bylot, he discovered, charted, and named Smith's Sound, and several others, and explored the large inlet now associated with his name. Later investigation has confirmed his descriptions. His latest voyages, 1617-21, were to the East. At the siege of Ormuz, which the English were helping the Shah of Persia to recover from the Portuguese, he was killed by a shot, 23d January 1622. See *Voyages of William Baffin*, 1612-22, edited by C. R. Markham (1830).

Baffin Bay, a gulf, or rather sea, to the north-east of North America, between Greenland and the great islands N.E. of Hudson Bay (one of which is called Baffin Land), in 68° to 78° N. lat. It is about 800 miles long, with an average breadth of 280. The shores are for the most part lofty and precipitous, backed by ranges of snow-clad mountains. Baffin Bay communicates with the Atlantic Ocean by Davis Strait; and with the Arctic Ocean by Smith Sound on the north, and Lancaster Sound on

the west. Baffin Bay, discovered in 1562, was first explored in 1615 by Baffin (q.v.). Baffin Land (or Island), to the W. and S. of the Bay, is a vast and barren insular tract in the Canadian district of Franklin, with an area of some 235,000 sq. m. The N.W. part is Cockburn Land (formerly called Cockburn Island). There are two large lakes in the south, Amadjuak and Nettilling. The finding of coal and gold led the Canadians to send an exploring expedition in 1913.

Bagamoyo, a village on the coast of Tanganyika Territory, opposite the island of Zanzibar, famous as a caravan starting-point.

Bagaria. See BAGHERIA.

Bagasse, also called Cane-straw or Cane-trash, is the refuse left after expressing the saccharine matter from the cane in making Sugar (q.v.).

Bagatelle (Fr. 'a trifle'), a game somewhat resembling billiards. A bagatelle-board is usually about 7 feet long and 21 inches broad; it is of slate, and is lined with cloth and cushioned. The game is played with nine small ivory balls and a cue or mace. The player's object is to put the balls down in nine numbered holes at the farther semicircular end of the board. The game is as old at least as 1819.

Bagdad (better *Baghdad*), the most famous city of the Moslem East, capital of Iraq, stands on both banks, especially the left, of the Tigris, about 500 miles from its mouth, in 33° 20' N. lat. and 44° 23' E. long., in a flat, treeless plain of considerable extent, which is dotted with the ruins of ancient buildings. The entire city was surrounded by a brick wall, 5 miles in circumference and 40 feet high, now for the most part broken down, and by a deep dry ditch; the two parts are connected by a bridge of boats, 220 yards long, and the communication is guarded by a citadel. There are four gates, the finest of which, bearing date 1220, has been closed since 1638. Bagdad has an extremely picturesque appearance from the outside, being encircled and interspersed with groves of date-trees, through which one may catch the gleam of domes and minarets; but it does not improve on closer inspection. The streets are narrow, crooked, unpaved, and dirty. British occupation, however, made a considerable difference. The houses have, in general, no windows towards the front, and are built of old, yellowish-red brick; but their interiors are often very gorgeously decorated. The vaulted ceilings, rich mouldings, inlaid mirrors, and massive gilding bring back to the recollection of the traveller 'the golden prime of good Haroun Al-Raschid.' The foundation stone of the university was laid in 1922, the first block opened in March 1924. Bagdad contains upwards of 100 mosques, though barely 30 of them are in use. These, together with the khans, bazaars, baths, the palace, and the citadel, are the only noticeable buildings in the city, whose public edifices, indeed, are meaner than those of any other oriental town of a like size. The domes and minarets, the earliest dating from 1235, are ornamented with glazed tiles and painting, in green and white.

The bazaars exhibit the produce of both Asiatic and European markets; but commerce has greatly decreased since Persia began to trade with Europe by way of Trebizond on the north and by the Persian Gulf on the south. Nevertheless, though no longer the chief emporium of merchandise between East and West Asia, Bagdad still carries on a considerable traffic with Aleppo and Damascus, and with Kermanshah in Persia, and has manufactures of red and yellow leather, silks, and cotton stuffs. Wool, dates, grain, galls, gum tragacanth, opium, carpets, skins and hides are exported. Of the 225,000 inhabitants, the greatest part are Turks and Arabs;

the remainder are native Christians, Jews, Armenians, Hindus, Afghans, and Persians. In summer, the heat is oppressive, ranging from 75° at sunrise to 122° F.; rain does not fall on more than twenty or thirty days throughout the whole year; but when the snows melt on the Armenian hills, the Tigris becomes a majestic, and often a destructive river. In 1831 an inundation destroyed one-half of the town, and several thousand lives. Natives and visitors seldom escape the 'Bagdad boil,' which attacks face, neck, hand, or foot. Cholera visits Bagdad periodically; in 1831, 4000 people perished daily for several days from its ravages. In 1870-1871 Bagdad suffered severely from famine. Since 1836, British steamers have plied on the Tigris between Bagdad and Basra; and here is one of the chief stations of the Anglo-Indian telegraph. In 1902 an irade from the sultan gave powers to a German company to construct a railway from Konieh to Basra, by Bagdad. Construction was pushed on during the Great War. See EUPHRATES.

Though in 1848 Rawlinson discovered here bricks bearing the name of Nebuchadrezzar, the historical city dates from the Abbaside Khalif Almansur (see KHALIF). In the 9th century it was greatly enlarged by Haroun Al-Raschid, and under his son, Al-Mamun, it became the great seat of Arabic learning and literature, glory and romance. A hundred years later Bagdad was ravaged by the Turks. In 1277 the grandson of Genghis Khan, Hulaku, put an end to the old khalifate; but his descendants were expelled by Timur, who took the city in 1393. For near a century it was in the possession of a Turkoman dynasty. In the beginning of the 16th century Shah Ismail, founder of the Sufi dynasty in Persia (q.v.), made himself master of it. Now it became a bone of contention between Turks and Persians; and after a memorable siege, it was conquered by the sultan, Murad IV., in 1638. Nadir Shah vainly essayed to retake it in the 18th century, and it remained under the sway of the Porte till 11th March 1917, when it was occupied by the British under Sir F. S. Maude.

The original province of Bagdad, lying between Arabia and Persia, comprised most of the basin of the Lower Euphrates and Tigris, and included the greater part of ancient Mesopotamia and Babylonia. Though now mostly a barren wilderness, it was in ancient times carefully irrigated and luxuriantly fertile, the seat of mighty empires, and inhabited by industrious populations. Railways and irrigation works will doubtless restore it. The inhabitants are Turkomans, Armenians, Turks, Jews, Arabs, and Kurds. See ASSYRIA, BABYLON, CTESIPHON, EUPHRATES, NINEVEH, SELEUCIA, TIGRIS.

Bagehot, WALTER, English economist and journalist, was born at Langport in Somersetshire, in 1826. He attended school at Bristol, and in 1842 went to University College, London, where he graduated in 1848; afterwards studied law, and was called to the bar in 1852, but joined his father in his business of banker and shipowner at Langport. In 1858 he married a daughter of the Right Hon. James Wilson, founder of the *Economist* newspaper; and from 1860 till 24th March 1877, when he died in his native town, he was the editor of that important journal. Bagehot's literary activity began in 1851, when he was in Paris at the time of the *coup d'état*, and wrote seven letters to a London paper, justifying the policy of Napoleon. These letters were published after his death in the first volume of his *Literary Studies*. Besides some other works of minor importance, there appeared during his lifetime: *The English Constitution*, a book of great value, translated into several modern languages; *Physics and Politics*, a treatise published in the International Scientific Series, which

applied to politics the theory of evolution (first ed. 1872); and *Lombard Street*, an invaluable work on the money-market (10th ed. 1892). In 1895 there were new editions of his *Literary Studies* (with Memoir by R. H. Hutton) and *Economic Studies*. Bagehot was a vigorous and brilliant writer, and a thinker of great acuteness and suggestiveness. While adhering to the current English type of thought, both in politics and economics, he was thoroughly independent in the formation and expression of his views, and was readier than most of his contemporaries to give weight to the historical and evolutionary side of things. In particular he recognised the limitations of the Ricardian economics, and considered political economy as a science not of rigorous laws, but of tendencies. See *Life* by Mrs Russell Barrington (1914), included also, along with Hutton's, in the *Works* (10 vols. 1915).

Baggesen, JENS, was born at Korsør in Zealand, 15th February 1764. A student at Copenhagen, he made a reputation as a poet by his lyrics and *Comic Tales* (1785). He made a lengthened tour through Germany, Switzerland, and France, and from this time German was to him a second mother-tongue. In 1811 he was appointed professor of Danish Language and Literature at Kiel; but three years after he removed to Copenhagen, where he became involved in an unseemly strife with Oehlschlager, and in 1820 he left Denmark, never to return, for he died at Hamburg, October 3, 1826, whilst on his homeward way. His most important work is his idyllic epic, *Parthenais oder die Alpenreise* (1804), which contains single passages of great beauty. Baggesen possessed little lyrical genius, though many of the poems are admirable. He was strong in satire, and maintained a powerful polemic against the extravagances of the German romantic poets. The sphere in which he shone most conspicuously was the serio-comic. His so-called 'humorous epic' of *Adam and Eve*, published shortly after his death, is a singular mixture of humour, pathos, and levity. His style is excellent, and in this respect the Danish language owes much to him. His German works fill 5 vols. (1836); his Danish, 12 (new ed. 1845-48). See his *Life* by his son (4 vols. 1849-56); and Clausen, *Jens Baggesen* (Cop. 1895).

Baghal, BAGUL, or BHAGUL, one of the Simla hill-states in the Punjab, India, on the south or left bank of the Sutlej, with an area of 124 sq. m. The population is about 26,000.

Baghche Pass, by which the Bagdad railway, about 100 miles E. of Adana, crosses a branch of the Taurus Mountains, is probably the Amanides Pylai of Greek writers, connecting Cilicia with Syria.

Baghdad. See BAGDAD.

Baghelkhand, the collective name of a historical area of 14,706 sq. m., including Rewah (13,000 sq. m.) and eleven small states (varying from 13 to 501 sq. m.) under a political officer subordinate to the governor-general's agent for Central India. This area lies to the south of the districts of Mirzapur and Allahabad. Up till 1871 it was under Bundelkhand. The state of Rewah is rich in mineral products, the most paying being the coal from Umaria, and in forests. It has also some very fertile tracts. It contains Amarkantak, on the Maikala Range, 3000 feet above the sea, the beautiful source of the Nerbudda, one of the most sacred spots in India.

Bagheria, or BAGARIA, a town of Sicily, 8 miles E. by S. of Palermo by rail. It is beautifully situated at the base of the isthmus which separates the Bay of Palermo from that of Termini, and is surrounded by groups of palatial villas of the Sicilian nobility. Pop. 20,000.

Baghistan. See BEHISTUN.

Bagimont's Roll, the name given to a valuation according to which the ecclesiastical benefices of Scotland were taxed from the end of the 13th century to the Reformation. It took its name from an Italian churchman, Boiamond (or Bajimont) of Vicci, a canon of the cathedral of Asti in Piedmont, who was sent by the pope to Scotland in 1274 to collect the tithe or tenth part of all the church livings, for a crusade. Hitherto, the Scottish clergy had been taxed according to a conventional valuation called the *Antiqua Taxatio*; but Boiamond set this aside. The clergy protested, and in a provincial council held at Perth in August 1275, they prevailed upon Boiamond, by promises and money, to return to Rome, there to entreat the pope to modify the subsidy. But the pope refused. Boiamond returned to Scotland to complete a valuation roll of its benefices; but he died before the tax itself was wholly collected. No complete copy of Bagimont's Roll in its original shape is now known to exist. A contemporary manuscript of so much of the Roll as applies to the archdeaconry of Lothian is preserved at Durham. A copy of Bagimont's Roll, as it appears to have existed in the reign of King James V. (1513-42), is preserved in the Advocates' Library at Edinburgh, in a hand of the beginning of the 17th century. It is full of inaccuracies; and it omits all livings of less than 40 marks a year. It was printed in *Archæologia*, vol. xvii. (1813). See J. Robertson's *Concilia Scotiæ* (Ban. Club), I. lxx.

Bagirmi, or BAGHERMI, a country in Cental Africa, bounded on the W. by Bornu and a portion of Lake Tsad, and with the powerful sultanate of Wadai to the NE. Its area is estimated at about 20,000 sq. m. The surface is flat, with a gentle rise towards the north—its general elevation being about 1000 feet above sea-level. It is traversed and watered by the Shari and its affluents. The soil yields durra and millet, which the natives barter for tobacco, pearls, and cowy-shells. The population is now very sparse. Mohammedanism has been introduced among them, but gross superstitions still prevail. Dr Nachtigal describes the natives as of the Sonrhai type, of low stature and not of pleasant features. Though they wear almost no clothing, they are in many respects semi-civilised, having a regular government in the capital, Chekna, as well as a military system. The sultan of Wadai took the capital in 1871, reducing the sultan of Bagirmi to a more complete state of vassalage to him. The country was first visited by Barth in 1852. By the Franco-German agreement of 1896, the region east of the Shari, including Bagirmi, became part of French Equatorial Africa.

Baglivi, GIORGIO, an illustrious Italian physician, born at Ragusa in September 1669. He studied at Salerno, Padua, and Bologna, and in 1692 went to Rome. Here, through the influence of his friend Malpighi, he was appointed professor of Anatomy at the college of La Sapienza, where he died in 1707. His work, *De Fibra Motrice*, is the foundation of the theory of medicine known as 'solidism,' which refers all diseases to changes in the solid parts of the body, and which claims that solids alone possess vital properties and can be the seat of pathological phenomena.

Bagnacavallo, an old town of Italy, still walled, and formerly noted for its strong castle, 11 miles W. of Ravenna. It contains a beautiful cathedral. Bartolommeo Ramenghi (1484-1542), the Bolognese painter, who is generally known as Il Bagnacavallo, was a native. Pop. 16,000.

Bagna'ra, an Italian town, on the Gulf of Gioja, 16 miles NE. of Reggio. Excellent wine is produced in the neighbourhood. Pop. 11,000.

Bagnères, the name of two towns in the Pyrenees, France, both well known as watering-places.—BAGNÈRES DE BIGORRE, on the Adour, in the department of Hautes Pyrénées, is situated 1820 feet above sea-level, at the base of Montalivet, and at the entrance to the romantic valley of Campan, 13 miles SE. of Tarbes by rail. Besides its extensive bathing-houses, it has a college, a theatre, a Pyrenean museum, a trades-hall; and contains a pop. of 8000. By the Romans it was known as *Vicus Aquensis Balarie* or *Aque Bigerorum*. It was destroyed by the Goths, but the fame of its waters survived, and is now so great that it is visited by about 20,000 strangers yearly. It has fourteen baths, the chief Les Thermes and Villa Théas, and above fifty springs (90° to 135° F.), recommended for catarrhal and nervous diseases. Woollens, linens, and *Barèges* (q.v.) are manufactured here.—BAGNÈRES DE LUCHON is situated in the department of Haute Garonne, in the beautiful valley of Luchon, 43 miles by road SE. of Bagnères de Bigorre, and 22 by rail S. of Montrejean Junction. Its cold, tepid, and hot sulphurous waters (up to 130° F.) are recommended in rheumatism, gout, cutaneous diseases, and paralysis, and attract some 10,000 visitors annually. Pop. 3500.

Bagnes, the convict prisons of France. The name is from the Italian *bagno*, used originally of a bath in the Seraglio at Constantinople, and then apparently of a prison for slaves in it or adjoining it. The bagnes superseded in 1748 the old punishment of the Gallies (q.v.); but in 1852 they were themselves abolished, the imperial government substituting for them deportation to Guiana. The latest existing bagnes were those at Toulon, Brest, and Rochefort.

Bagni di Lucca, a bathing-place of Italy, 17 miles N. of Lucca; pop. 12,000. It is situated in the fine valley of the river Lima, a branch of the Serchio, and has hot springs of various temperature from 96° to 136° F.

Bagno a Ripoli, an Italian village, 5 miles distant from Florence, containing baths, around which wealthy Florentines have built palaces and villas. It is now really a suburb of Florence.

Bagno in Romagna, an Italian bathing-place, 35 miles E. by N. of Florence, on the right bank of the Savio, not far from its source. It has hot springs of temperature 108°-110° F., in which Natron (q.v.) is present.

Bagpipe, a wind-instrument, whose fixed characteristic has always been two or more reed-pipes attached to and sounded by a wind-chest or bag; which bag has in turn been supplied either by the lungs of the performer or a bellows. Some such instrument seems to have been generally known, at least throughout Europe and Asia, from a very early period. It was known to the Hittites (q.v.), Hebrews, Greeks, and Romans, and appears on their sculptures and coins—e.g. a coin of Nero, who is said to have been a performer upon it. An ancient terra-cotta, excavated at Tarsus in Asia Minor, by Mr W. Burckhardt Barker, and supposed to date from about 200 B.C., represents a wind-chest with vertical rows of reed-pipes firmly fixed to the body of a performer. Sir William Ouseley met with it in Persia, where it is called 'reed-bag.' It is known in China and in some parts of India, and still continues in use in many countries of Europe, including Italy, the south of France, and Britain. In the 15th and 16th centuries it was common in Germany and England; carvings occur of it in churches at Boston, Great Yarmouth, and Hull; as also at Melrose. It is mentioned by Chaucer and Spenser, and several times by Shakespeare. Fuller in his *Worthies* describes the Lincolnshire bagpipe, and it

was played at Manton in that county not long before 1850. Geoffrey of Monmouth describes the bagpipe as a Welsh—not Irish or Scottish—instrument (see Leyden's essay in Murray's edition of *The Complaynt of Scotland*, 1872). The earliest Scottish bagpipe is probably one bearing the date 1409. Except that it wants the large drone, introduced early in the 18th century, it is similar to the Highland bagpipe of the present day.

Highland Bagpipe.

first been used in war by the Highlanders at the beginning of the 15th century, superseding the war-song of the bards. It has left its traces very distinctly in music, many popular national airs of different countries being evidently founded upon its drone bass and imperfect scale; while imitations of its effect are to be found in the works of many of the great modern composers. The Scottish Highland bagpipe is the only form of the instrument which is keeping its ground in Britain. It consists of an air-tight leathern bag, inflated by the breath of the player through a valved tube; and from this bag the air proceeds, through three wooden pipes containing reeds of fixed tone called *drones*, which furnish a continuous bass, and another reeded pipe of conical bore with holes in it, which produces the melody, and is termed the *chanter* (see fig.). The drones have reeds somewhat like those of the organ, the two smaller producing a note in unison with the lowest A of the chanter, the larger one A an octave lower. The chanter has a double reed like that of the oboe or bassoon, and has seven holes in front for the fingers, and one behind for the thumb of the left hand. The compass is only nine notes, from G in the treble clef to A above it; these, however, do not form a diatonic scale, not being all accurately tuned to each other; the general effect of the music approximates to the key of A, but with the sevenths flat. This imperfection of scale, together with its somewhat harsh tone, is the cause of its unpleasant effect upon the accurately sensitive ears of those accustomed to music in the natural diatonic scale; but from the same cause results its semi-barbarous, exciting stimulus upon the Highlander in the battlefield. In playing, the drones are thrown over the left shoulder, the bag tucked under the left arm, the blowpipe taken in the lips, and the chanter held with the

fingers. In the Highlands, the 'skirl' of the bagpipe is equally esteemed in the 'lament' or at the merrymaking. The piper usually walks up and down while playing. The very abundant music for the instrument comprehends reels, strathspeys, marches, and pibrochs, a special peculiarity being the use of frequent and sometimes largely extended groups of ornamental passing notes, termed *warblers*. First-rate pipers have been known to introduce warblers of eleven notes between the last up beat, and the first down beat of a bar. Warblers of seven notes are common, and five usual, but their effect can only be understood from hearing the performance of a really good piper. That many of the older airs are written in the so-called pentatonic scale, omitting the fourth and seventh, is probably to be accounted for by the already-mentioned fact that several of the intervals on the instrument are not in perfect tune, and would naturally be avoided. Until recently bagpipe music was taught and even written in a notation of its own; but there are now several large collections of the music printed in ordinary notation. In music printed for the Highland pipes, no signatures are required, its nine notes being invariable. Each burgh in Scotland had formerly one or more pipers, and they formed also a regular part of the retinue of the Highland chieftains, the office being in both instances frequently hereditary. The most famous performers were the MacCrimmons, who for several generations were hereditary pipers to the MacLeods of MacLeod, and the last of whom died in 1822. Next to them the MacArthurs, pipers to the MacDonalds of the Isles, were held in esteem. Among burgh pipers the family of Hasties were hereditary pipers of Jedburgh for upwards of 300 years; the last of them died at the beginning of the 19th century. The clan piper still takes a prominent part in Highland festivities, funerals, and other celebrations; and a piper forms one of the royal establishment at Balmoral. Pipers are attached to all the Highland regiments (see *BAND, MILITARY*), and bagpipe performances and contests form a feature at Highland gatherings, at home or abroad, when prizes are offered to the best players of pibrochs, reels, &c.

The Scottish burgh pipers, above alluded to, are supposed to have played on a variety of bagpipe called the Lowland pipe. It was smaller than the Highland pipe, and played with a bellows instead of by the mouth, otherwise, however, being exactly similar in principle; as was also the old form of the

Irish Bagpipe.

Northumbrian pipe. A newer form of the latter is still played. It is also a bellows instrument, and has several keys on the chanter, giving it a chromatic scale; only one hole is uncovered at a time, and the end of the chanter is closed.

The (later) Irish bagpipe (the 'elbow pipe,' as distinguished from the old 'iron pipe' blown by the mouth) possesses a nearly full chromatic

scale with a compass from D below the stave to D above the stave. The drones, which are all fixed on one stock, also possess keys, which are played with the wrist of the right hand, giving an harmonious bass which is very effective in the hands of a good player. Some of the drones are of great length, winding as many as three times the length of the apparent tube. The general arrangement may be seen from the figure. The player is seated, with one side of the bellows tied firmly to his body, the other to his right arm; the bag under the left arm, the drones resting over his leg, and the end of the chanter resting on a pad of leather on the knee, on which it is 'tipped' for the purpose of articulating many of the notes. From the softness of the reeds used, the Irish pipe is a very sweet instrument, but its use is rapidly dying out. The Italian bagpipe, familiar in Britain through the wandering *pifferari*, is a very rude instrument, consisting of a goat's skin with an enormous drone, on which the player performs by means of a mouth-tube; another player playing the melody on a separate chanter. See books by Manson (1901) and Frazer (1907).

Bagratidæ, a royal dynasty (9th–11th century) of Armenia (q.v.) and Georgia (q.v.).

Bagration, PETER IVANOVICH, PRINCE, a distinguished Russian general, descended from the royal family of the Bagratidæ of Georgia and Armenia, was born in 1765. He entered the Russian service in 1783, and was trained under Suvorof. In 1788 he was engaged at the storming of Okzakof; fought in 1792 and 1794 against the Poles; in 1799, in Italy and Switzerland; and distinguished himself in the Austro-Russian war of 1805 against the French, especially in the sanguinary engagement of November 16 of that year, when, with only 6000 troops, he bravely stood during six hours against a force of 30,000 under Murat. Subsequently, he was engaged in the battles of Austerlitz, Eylau, and Friedland, and took a part in the Russian campaign against the Turks, especially in the siege of Silistria, 1809. In the campaign of 1812 he commanded the second Russian army of the west, and had the misfortune to fail in his attack on Davout near Mohilev; but succeeded in forming a junction with the main army at Smolensk. He was, however, mortally wounded in the battle of Borodino (q.v.), and died October 7, 1812.

Bagshot Sands, a series of strata overlying the London clay; the name being derived from Bagshot Heath, in Surrey and Berkshire. See Eocene.

Baháism. See BÂBÍ.

Bahámas, or LUCAYOS (Span. *Los Cayos*), a chain of British West Indian islands, stretching about 600 miles north-westwards from near Hayti to within 72 miles of the east coast of Florida. From Florida they are separated by the channel through which flows the Gulf Stream (q.v.); and from Cuba, by the old Bahama Channel. The chain extends in N. lat. from 21° to 27° 34', and in W. long. from 72° 40' to 79° 5'; and it rests mainly on two shoals—the Great Bank to the south, and the Little Bank to the north. There are 20 larger islands, 653 islets or cays, and 2387 reefs. The chief members of the group, if reckoned from the N.W., are: Grand Bahama, and Great Abaco, Eleuthera, Harbour Island, New Providence, Andros, Cat Island, Watling's Island, Exuma, Long Island, Crooked Island, Fortune Island (or Long Cay), Acklin, Mayaguana (or Mariguana), Inagua, Little Inagua, Caicos (q.v.) and Turks Islands, which geographically belong to the Bahamas, have since 1843 been politically annexed to Jamaica.

The area is 4400 sq. m. (counting unimportant islets, about 5400 sq. m.); and in 1921 the popu-

lation was 53,000. Of these one-fourth are Europeans; the great majority are descendants of liberated slaves. Of coralline formation, the islands generally are of reef-like shape, long, narrow, and low, the highest hill not exceeding 400 feet. With very little appearance of soil, and lacking in running streams and fresh-water lakes, they derive considerable fertility from the tendency of the porous rock to retain moisture. New Providence, Andros, and Abaco have barren tracts and forests of dwarf firs; the most productive islands are Eleuthera, Exuma, Long Island, Cat Island, and Inagua. The most lucrative industry is sponge-fishing. During the 20th century thousands of acres have been planted with sisal-hemp, which is exported. Other industries are lumbering, stock-farming, and the cultivation of pine-apples, grapefruit, tomatoes, oranges, lemons, Guinea corn, maize, cotton, tobacco, coconuts, olives, pimento, cinnamon. Turtles are caught; shells, pearls, and ambergris are obtained. Salt used to be exported. There are several sisal-factories, pine-apple canneries, and timber-mills. The temperature ranges from 51° to 113° F.; but the mild, equable winter climate is often prescribed for pulmonary complaints. The annual rainfall is from 40 to 50 inches, being heaviest from May to October. In 1866 (Oct. 1), 1883 (Sept. 8), 1899 (Aug.), and 1908 (Oct. 1) the Bahamas were visited by destructive cyclones.

The Bahamas were Columbus's earliest discovery (1492). But the precise spot of his first landing is still debated. Cat Island was once believed to be his Guanahani or San Salvador; but later investigators have transferred the honour to Watling's Island, among others. The Bahamas, depopulated, but not again colonised by the Spaniards, were occupied by the English in 1629—to whom, after various vicissitudes of fortune in the wars with Spain and France, they were ultimately secured by the peace of Versailles (1763). Nassau, in New Providence, is the seat of government and chief port. During the American civil war Nassau became the station for blockade-runners, and thence derived unexampled prosperity. The constitution consists of a governor, aided by an executive council of nine members, a legislative assembly of nine, and a representative assembly of twenty-nine. See Lucas's *West Indies* (2d ed. 1905); Shattuck, *The Bahama Islands* (1905); Britton and Millsbaugh, *Bahama Flora* (1920).

Bahar. See BEHAR.

Bahá'ullah. See BÂBÍ.

Bahawalpur, on the south bank of the Indus, is capital of an Indian native state in political connection with the Punjab. Five miles off the Sutlej is crossed by the fine 'Empress Bridge' of the Indus Valley Railway. Bahawalpur has a circuit of four miles—part, however, of the enclosed space being occupied by groves of trees. Bahawalpur has manufactures of scarfs and turbans, silks, chintzes and other cottons; and the immediate neighbourhood is remarkably fertile in grain, sugar, indigo, tobacco, and butter. Population, 18,000.—The surface of the state is remarkably level; but only about one-sixth, skirting the Sutlej and Indus, is capable of cultivation. From 1866 till 1879 the state was under British management, during the Nawab's minority, and it prospered greatly, waste lands being cultivated, canals increased, the army organised, and the railway carried through a large section of the territory. The great majority of the inhabitants are Mohammedans. Area, 16,000 sq. m.; pop. 800,000.

Bahí'a, capital of the state of Bahia, next to Rio de Janeiro and São Paulo the largest city of Brazil, is built on a range of hills stretching along

the seashore. It is otherwise called São Salvador—the more usual term being taken from *Bahia de Todos os Santos*, or *Bay of all Saints*, on the east shore of which it is situated. The bay, one of the finest in America, is defended by forts, with the island of Itaparica sheltering the entrance. Bahia is built partly on the shore and partly on high ground; the lower town is dirty, with narrow paths. Street railways connect the city with its suburbs, and flights of steps and a hydraulic elevator aid the communication between the upper and the lower town. Bahia has a university, an exchange, arsenal, and many churches and public institutions; is the seat of an archbishop, who is primate of Brazil; and is the point of departure for a railway line to the interior. It is connected by submarine telegraph with Pernambuco, Pará, and Rio. The chief exports of Bahia are sugar, cotton, coffee, tobacco, rice, rum, dye-stuffs, fancy woods, coconuts, horns, hides, diamonds, and bullion; and it imports manufactured goods, provisions, flour, salt, iron, glass, and wines. Bahia is the oldest city in Brazil, and till 1763 was the capital of the colony. The bay was discovered by Amerigo Vespucci in 1503, and the city was founded by the Portuguese in 1510. Bahia is an admirable port, but very unhealthy. Pop. 400,000, whites, blacks, and mulattoes.—The state (164,600 sq. m.; pop. 3,373,000) has mineral deposits, in great measure lost for want of good roads; some districts produce diamonds. The Brazil wood found in its primeval forests equals that of Pernambuco; and it exports sugar, coffee, tobacco, cacao, rice, and hides. The interior contains lofty and dry sierras; the maritime districts are fertile, well watered, and thickly populated.

Bahía Blanca, a thriving port of Argentina, in the south of Buenos Aires province, on the Naposta River, 3 miles from its mouth in the bay of Bahía Blanca. It is composed of two towns, a few miles apart. The Puerto Militar, to the east, is a garden city, which combines the character of a fashionable watering-place with that of a great naval base. The civil port owes its rapid growth to the wheat export of the south of Buenos Aires province, and to the enterprise of railway companies, which have greatly enlarged and improved the harbour, and are encouraging the development of new wheat-lands by irrigation. Pop. 50,000.

Bahía Honda, a harbour on the north coast of Cuba, 60 miles WSW. of Havana, protected by a fort. It is leased to the United States as a coaling station. Copper and coal are worked in the neighbourhood, and the sulphur springs of Aguacate lie a short distance south.

Bahr, an Arabic word signifying a large body of water, is applied both to lakes and rivers.—Bahr-el-Abiad (the White River) and Bahr-el-Azrak (the Blue River) are the chief branches of the Nile (q.v.).—Bahr-el-Ghazal is the name of the upper branch of the Nile, constituted by the Bahr-el-Arab and many other tributaries, which flows sluggishly eastward to join the Bahr-el-Jebel and so form the Bahr-el-Abiad. The Bahr-el-Ghazal gives name to a province of Anglo-Egyptian Sudan, bravely held by Frank Lupton. Another Bahr-el-Ghazal, E. of Lake Chad, was thought an old outlet.—Bahr-el-Yemen is the Red Sea (q.v.), and Bahr-Lút (Sea of Lot) the Dead Sea (q.v.).

Bahr, HERMANN, Austrian-German writer, was born on the 19th July 1863 at Linz. He studied at Vienna, Graz, Czernowitz, and Berlin universities, travelled in Europe and America, edited various periodicals in Berlin and Vienna, managed the Deutsches Theater in Berlin, and afterwards lived in Salzburg. Leader of 'young Germany'

against naturalism, champion of symbolism and the 'modern,' he proved himself a versatile essayist and a singularly receptive critic of literature and art in *Zur Kritik der Moderne* (1890), *Die Überwindung des Naturalismus* (1891), and other books. Later, though he still wrote excellent criticism and fascinating *Tagebücher*, he became more famous as a dramatist and novelist. *Das Konzert* has been well described as 'the most genially malicious comedy of modern times.'

Bähr, JOHANN CHRISTIAN FELIX, classical scholar, was born at Darmstadt in 1798, and educated at Heidelberg gymnasium and university, of which last he became ordinary professor of Classical Philology in 1823. His chief work is his *Geschichte der römischen Litteratur* (1828; 4th ed. 1868–70), which is noted for its clearness and comprehensiveness. Three supplements deal with the Christian Poets and Historians of Rome (1836), the Christian Roman Theology (1827), and the History of Roman Literature in the Carolingian Period (1840). His edition of Herodotus (2d ed. 1855–61) is also noteworthy. He died 27th November 1872.

Bahraich, a town of Oudh, India, near the old bed of the Gogra, 70 miles NE. of Lucknow. It is an old town, with some local trade in piece goods and copper utensils. To the shrine of Masáúd, a warrior and Mussulman saint, there is a great concourse of pilgrims in May. Population, 27,000.

Bahrddt, KARL FRIEDRICH (1741–92), a German theologian and thinker, was born at Bischofsverda, in Saxony, and studied at Leipzig, where he became professor of Biblical Philology in 1766. Two years later he had to leave Leipzig for his immoral conduct. At Erfurt he was placed in the chair of Biblical Antiquities. Here he wrote two works whose heterodoxy involved him in controversies. In 1771 he was called to the chair of Theology at Giessen, and here also he preached with approbation for a few years, until he found it necessary to resign. Inhibited from teaching by the government, he betook himself to Halle in 1779, and there for ten years he kept a public-house. Two political pamphlets brought him a year's imprisonment at Magdeburg, and gave him leisure to write his memoirs (Berlin, 1790). See Life by Leyser (2d ed. 1870).

Bahrain Islands, a group of islands in the Persian Gulf, 20 miles off the El Hasa coast. The main island, Awal or Bahrain (area, 200 sq. m.) is 30 miles long and 10 broad. It is hilly in the centre, and little cultivated. Dates are grown. Manama (pop. 25,000), the capital, has a good harbour. The famous pearl-fisheries have been known since ancient times. The transit trade and smuggling are active. The islands are ruled by a sheik, and since 1867 have been under British protection. Pop. about 110,000 (mostly Arab Sunnites and Shiites).

Baiæ, a small town of antiquity, on the coast of Campania, 10 miles W. of Naples and opposite Puteoli, where the present castle of Baja stands. When the Roman empire was in its greatest splendour, the beauty of its situation, the fineness of the surrounding scenery, and the excellence of its mineral springs made Baiæ such a favourite resort of the Roman nobles that for want of space for their baths and villas they built out into the sea. Julius Cæsar, Piso, Pompey, Marius, Julia Mammæa, and others had country-houses at Baiæ. Horace preferred Baiæ to all other places in the world. The ruins, still standing on the desolate coast, or visible beneath the clear waters of the sea, are now the only evidence of the former magnificence of Baiæ. The ruins of three supposed temples, as well as the remains of a few *thermæ*, or warm

baths, still attract the attention of archæologists. The harbour, one of the largest belonging to the Romans, is now small and poor. The surrounding country is covered with the ruins of Roman villas, sepulchral monuments, and other buildings.

Bai'kal (in Turkish, *Bei-kul*—i.e. 'rich lake') is, after the Caspian Sea and the Sea of Aral, the largest lake of Asia, with an area of some 11,580 sq. m. It is a fresh-water lake, and is situated in the south of Siberia, in the government of Irkutsk, in 51° 20' to 55° 30' N. lat., and 103° to 110° E. long., and somewhat resembles a sickle in shape. Its length is 370 miles, and its breadth $9\frac{1}{2}$ to over 50 miles; height above the sea, about 1600 feet; mean depth, 850 feet, but in some places as much as 5400 feet, more than 3800 feet below sea-level. The volume of water is calculated accordingly to be more than double that of Lake Michigan, which has a very much larger area. Its waters are a deep blue, and remarkably clear. The Baikal Mountains, a spur of the Altai, inclose the lake, which is fed by numerous streams, the chief of which are the Selenga and Bargusin. Its outlet is by the Lower Angara, a chief tributary of the Yenisei; but the river is inconsiderable in size compared with those which flow into the lake. It has several islands, the largest of which, Olkhon, has a length of 32 miles. There are numerous hot springs on its shores, and earthquakes are frequent. Formerly the lake seems to have been much more extensive; its level has fallen within modern times (see ASIA). In the southern part a subaqueous ridge divides Baikal into two basins. The lake has two commercial ports and a fleet of steamers. Till the completion of the Siberian railway round the south end (in 1904, during the war with Japan), trains were ferried across by special ferry-boats—in winter by help of ice-breakers, or even on the ice. Salmon and sturgeon are abundant, the former coming up the Yenisei from the Arctic Ocean, and large quantities of a fish resembling herring are also caught in it. It is one of the few lakes containing fresh-water seals, the capture of which employs most of the Russian settlers throughout the summer. A peculiar fish, called the golomyinka (*Callionymus baicalensis*), which is almost one mass of fat, yielding admirable oil, was at one time found in immense numbers cast up on the beach after a storm, but it is now much scarcer. The surface of the lake is frozen from November to May, but the traffic is carried on over the ice. Besides the Russians in the town of Kultuk at the SW. end (with a harbour and lighthouse), the shores of Lake Baikal are also inhabited by tribes of the Buriats and Tunguses. See ASIA; and a study by Schokalsky and Schmidt (Bordeaux, 1907).

Baikie, WILLIAM BALFOUR, traveller, naturalist, and philologist, was born at Kirkwall, Orkney, 27th August 1825, and having studied medicine in Edinburgh, entered the royal navy as assistant-surgeon in 1848. He served in the Mediterranean, and from 1851 to 1854 acted as assistant-surgeon at Haslar Hospital. He was appointed surgeon and naturalist to the Niger expedition of 1854, and succeeding through the captain's death to the command of the *Pleid*, in his first voyage he penetrated 250 miles higher than any previous traveller; but in his second expedition of 1857 the *Pleid* was wrecked, and he was left by his fellow-explorers to continue his work alone. He founded a native settlement called Lukoja, at the junction of the Quorra and Benue, and within five years he had opened the navigation of the Niger, constructed roads, collected a native vocabulary, and translated parts of the Bible and Prayer-book into Hausa. He died while on leave of absence at Sierra Leone, 12th December

1864. He published *List of Books and Manuscript relating to Orkney* (Zetland, 1847); along with R. Heddle, *Historia Naturalis Orcadensis: Zoology* (Part I. 1848); and *Observations on the Hausa and Fulfulde Languages* (1861).

Bail, as generally understood, means the security given that a person charged with a crime or offence shall appear for trial, he obtaining liberation from prison in the meantime. The laws of England and Scotland differ on this subject. In England the committing magistrate may in all cases, except treason, admit to bail. At common law, he, in cases of misdemeanour, was bound to release the accused on bail; but recent legislation, rendering the costs of prosecution chargeable on the county, has conferred on the magistrate a wide discretionary power in the matter of bail. In cases of treason the King's Bench Division may admit to bail. The magistrate must judge of the sufficiency of the person tendered as bail, and must fix at his discretion the amount of bail to be paid if the accused fails to appear. If the accused seek to leave the country, the bail may have him apprehended. In Scotland, the law was that in capital cases (i.e. according to the old law of punishment—serious theft being capital) the magistrate was not entitled to accept bail, but that in all other cases, the accused had a right to bail, which by a statute of 1799 was fixed at certain amounts for the various classes of society; £300 for a burgess or householder, and £60 for an inferior person. This arrangement was, however, found to work badly, and by the Bail Act of 1888 the law was altered so that all crimes and offences except murder and treason became bailable; the fixing of the amount was given to the magistrate granting bail, an appeal to the High Court being allowed both to the applicant and to the public prosecutor. The application for bail must be disposed of within twenty-four hours, failing which the accused must be forthwith liberated. The right of the High Court and of the Lord Advocate to admit to bail was not affected by the act. When an accused person fails to appear, sentence of outlawry is pronounced, and the bail-bonds are forfeited. In civil procedure in England, bail is used also as the technical name of securities given for the release of an arrested ship, or the loosing of a foreign attachment, and in some other cases.

In the United States, the practice with regard to bail is very much the same as in England both in civil and criminal cases. Bail is admitted upon all arrests in criminal cases when this offence is not punishable with death; in cases of treason against the government it may be admitted in the discretion of the court. When the punishment is death, bail can be taken only by the supreme or circuit court, or by a judge of the district court of the United States. The bail on commercial contracts is not discharged by death; bail for appearance in court is discharged in that event. The enforcement of recognisance is generally similar to that under the common law. See CRIMINAL LAW.

Bailén, or BAYLEN, a town of Andalusia, Spain, 22 miles N. of Jaen. It has manufactures of glass, bricks, tiles, &c. Pop. 9000. Here the Spaniards won their first and only victory over the French, 19th July 1808, when about 18,000 French soldiers laid down their arms.

Bailey, NATHAN or NATHANIEL, an early English lexicographer, whose work appeared in 1721 under the title, *An Universal Etymological English Dictionary*, to which a supplementary volume was added in 1727. In 1802 it had reached its thirtieth edition. An interleaved copy was the foundation of Johnson's more famous work. Lord Chatham is said to have read it through twice, and it

was one of the sources from which Chatterton drew his pseudo Old English words. In 1730 appeared the *Dictionarium Britannicum*, by several hands, under the supervision of Bailey. This busy author wrote several other books, now of but slight importance. Of his life very little is known, save that he was a 'Seventh-day Baptist' and kept a boarding-school at Stepney, where he died, June 27, 1742. The English Dialect Society reprinted, in 1883, the 18th-century dialect words preserved in Bailey's Dictionary.

Bailey, PHILIP JAMES, poet, was born at Nottingham, 22d April 1816, and after studying at Glasgow University, was called to the English bar in 1840, but never practised. *Festus*, the poem by which he is best known, was published in 1839, and reached an 11th (Jubilee) edition in 1889, having in the course of these various editions received a large amount of new matter. It attracted considerable notice in England, and in America was hailed with a perfect tornado of applause. Before the enthusiasm had cooled, its author was in certain quarters mentioned in the same breath with Shakespeare, Milton, and Goethe. And by so great a poet as Rossetti it was, says his brother, under date 1843 'enormously relished, read again and yet again.' At least one modern critic ranks him with Browning and Tennyson, and thinks that 'for sheer sublimity he surpasses both.' In 1850 appeared *The Angel World*, afterwards incorporated—not to its advantage—with *Festus*. Later works were *The Mystic*, *The Age*, and *The Universal Hymn* (1867), and of these also passages were put into *Festus*. He lived long in retirement, but was made LL.D. of Glasgow in 1901; and he died 6th September 1902.

Bailey, SAMUEL (1791–1870), born in Sheffield, became a banker there, wrote books, stood—twice and unsuccessfully—for parliament as a philosophical radical, and left £80,000 as a bequest to the city. In his first work, *Essays on the Formation and Publication of Opinions* (1821), he ably defended the proposition that a man's opinions are independent of his will. His *Essays on the Pursuit of Truth and on the Progress of Knowledge* (1829) are only less valuable. His many controversial books on questions of political economy are already almost forgotten, though these, as well as his pamphlets and treatises on political representation, primogeniture, and the like, are characterised alike by terse exposition and vigorous style. Not less interesting but of less value, because to some extent the fruit of insufficient knowledge, are his *Review of Berkeley's Theory of Vision* (1842), *Theory of Reasoning* (1851), and *Letters on the Philosophy of the Human Mind* (1855–63). The third series of the last contains an able defence of utilitarianism, in which the author avows himself a thorough determinist. His conjectural emendations of the text of Shakespeare, published 1862–66, are of little value.

Bailey (probably derived from the middle Lat. *ballivum*, frequently confused with *baillie*; 'the jurisdiction of a *baillie* or *bailiff*'), the whole space enclosed within the external walls of a castle, with the exception of that covered by the keep. This space was variously disposed of, and, of course, differed greatly in extent. Sometimes it consisted of several courts, which were divided from each other by embattled walls, so as to form a series of fortifications. When these courts were two in number, they were known as the outer and inner bailey. The entrance to the bailey was generally by a drawbridge over the ditch, and through a strong machicolated and embattled gate. It was often of great extent, containing the barracks for the soldiers, lodgings for workmen and artificers,

magazines, wells, chapels, and sometimes even a monastery. The word has survived in some proper names, as the *Old Bailey*, the seat of the Central Criminal Court in London, so called from the ancient *bailey* or *ballivum* of the city wall between Ludgate and Newgate, within which it was situated. A new 'Old Bailey' was opened in 1907. 'Old Bailey style' refers to the licence of vituperation assumed to characterise its proceedings. In Durham, also, the *bailey* is now a street, with the old name retained. The term is also applied to the outer wall or first line of defence, as well as generally to any of the circuits of walls which surrounded the keep.

Baillie, a Scottish term, with several legal applications, but originally a mere doublet of *bailiff*. It popularly signifies a magistrate of a municipal corporation in Scotland, vested, *ex officio*, with judicial and administrative authority within the city or burgh. The civil and criminal jurisdiction of the Burgh Court, however, is not extensive. In royal burghs, the office is in some respects analogous to that of Alderman in England. The chief-magistrate of a Scots corporation, called the *Provost* (q.v.), and often one or more of the *baillies*, are, in virtue of their office, in the commission of the peace; and *baillies* are exempted from serving on juries. There are also *Baillies of Legality and Barony*, who are appointed by the *Superior* or over-lord of the Manor (q.v.), with limited powers fixed by the Heritable Jurisdictions Act, 1747. There were also *baillies* of the four bailieries—viz. Carrick, Kyle Stewart, Cunningham, and Lauderdale. There is a *bailie* for the Sanctuary or Abbey of Holyrood, appointed by the Duke of Hamilton as hereditary keeper, and having jurisdiction within the precincts (see SANCTUARY). The word *Bailie* was also formerly a term in the practice of Scots conveyancing, and signified an officer who represented the superior, and who, as such, gave *seisin* or *Sasine* (q.v.), or delivery of the lands sold to the buyer or his attorney, the sheriff being *bailie* in crown land; but by the changes and simplifications effected by recent legislation, the office of *bailie* in this sense has been abolished.

Bailiff (Scots *baillie*, Fr. *bailli*, Ital. *balivo*; all from late Lat. *ballivus*, an adj. from *ballivus*, 'a carrier,' then 'a manager'), an officer with public authority in a certain district. In England it was applied formerly to the king's officers generally, and it is still the formal title of the chief-magistrate of certain towns, as the 'Bailiff of Dover Castle.' The name *ballivus* was given at the Greek imperial court in Constantinople to the chief tutor of the imperial children, afterwards to the Venetian superintendent of the foreign merchants there, and in the form *Balio* to the Venetian ambassadors themselves. The title *Ballivus* was introduced by the Knights of St John into the south and west of Europe, as the eight members of their chapter were called *Ballivi conventuales*. In England the name was introduced after the conquest, and applied loosely to several officials; thus the sheriff was spoken of as the 'king's bailiff,' his shrievalty as his 'bailiwick.' Later, the word became applied to elective functionaries, but gradually to definite offices, as the presiding magistrate of a town—the English reeve, but unlike that officer, nominated by the over-lord instead of the citizens—as the bailiff of Beverley, by the Archbishop of York. By the end of the 13th century, the mayor had supplanted the bailiff almost everywhere.

BAILIFF, in English law, is a legal officer, and may be described as the keeper, protector, or superintendent of some duty or charge legally imposed on him. As officers of the law, bailiffs put in force

arresting process, and they perform other duties within the county or bailiwick required of them by the sheriff, who is their immediate official superior. In this sense bailiffs are either *bailiffs of hundreds* or *bound bailiffs*. The duty of the former is to collect fines, summon juries, attend the judges and justices at the assizes and quarter-sessions, and execute writs and processes in the several hundreds. *Bound bailiffs*, again, are officers usually joined by the sheriffs with the bailiffs of hundreds, and employed on account of their adroitness and dexterity. They are called bound bailiffs because, the sheriff being civilly responsible for their official misdemeanours, they are annually bound in an obligation, with sureties, for the due execution of their office. There are also *special bailiffs*, who are officers appointed by the sheriff on the application of the party suing out the process to be executed; and whenever a party thus chooses his own officers, he is considered to discharge the sheriff from all responsibility for what is done by him. There is, besides, another exceptional class of bailiffs, called bailiffs of *liberties*, honours, manors, and other lordships and franchises, whose appointments, duties, and responsibilities are regulated by the 7 Vict. chap. 19. The *high bailiff* of a county court is a permanent officer under whose directions the process of the court is executed by sub-bailiffs. The office of high bailiff is usually combined with that of the registrar.

The sheriff himself is the 'king's bailiff,' and, as such, it is his business to preserve the rights of the crown within his bailiwick. He must seize to the sovereign's use all lands devolved to the crown by attainder or escheat; must levy all fines and forfeitures; and must seize and keep all Waifs (q.v.), wrecks, estrays, and the like, unless they be granted to some subject.

In the United States, the term bailiff is seldom used except sometimes to designate a sheriff's deputy or constable, or a party liable to account to another for the rents and profits of real estate; as in some cases a tenant in common who receives more than his share. The duties of a bailiff are performed in America by a deputy-sheriff, constable, or tipstaff, who are officers acting under the orders of the sheriff or magistrate, or under the immediate supervision of the court.

Bailiwick legally means the county or district within which the sheriff, as bailiff of the king, may exercise jurisdiction. It is often applied by English writers to foreign towns or districts under a *vogt* or *bailli*.

Bailleul, a town in the French department of Nord, 19 miles NW. of Lille, with various manufactures, and a brisk trade in corn and cheese. It was wrecked in the Great War. The Balian family hence derived its name. Pop. 13,000.

Baillie, LADY GRIZEL, born in 1665, was the daughter of the Scottish patriot, Sir Patrick Hume (q.v.), afterwards first Earl of Marchmont, and in 1684 supplied him with food during his concealment in the vault beneath Polwarth church. She shared her parents' exile at Utrecht (1686-88), and in 1692 married the son of Baillie of Jerviswood. He died in 1738, and she on 6th December 1746. She is remembered by her songs, the best of which is 'And werena my heart light I wad die.' See her *Household Book* (Sc. Hist. Soc. 1912), and the *Memoirs* (1822) by her daughter, Lady Murray.

Baillie, JOANNA, poetess, was born in Bothwell manse, in Lanarkshire, 11th September 1762. Her father, a Presbyterian minister, in 1776 became professor of Divinity in Glasgow; her mother was the sister of William and John Hunter. She received a superior education, and soon began to manifest those talents which subsequently excited

the admiration of the public. Her career was a singularly happy one, but devoid of all striking incident. In 1784 she went to reside in London, where her brother, Matthew Baillie, had established himself as a physician. In 1806 she and her sister took a house for themselves at Hampstead, and here she remained till her death, which occurred on the 23d of February 1851, when she had attained the venerable age of 88. Agnes, her sister, survived till 1861, being then a hundred years old. No authoress ever enjoyed a larger share than Joanna Baillie of the esteem and affection of her literary contemporaries. All vied in showing her a courteous respect, and even America sent its votaries to her little shrine at Hampstead. Her greatest achievement is undoubtedly the nine *Plays on the Passions* (1798-1836), which, though erroneous in conception, are full of noble and impressive poetry, and often characterised by intense dramatic power. The principle upon which Miss Baillie proceeded in the construction of these plays, was, like Marlowe and George Meredith, to take a single passion as the subject of a work, and to exhibit its influence on an individual supposed to be actuated by nothing else. In spite of this method of treatment, there are scenes, in her tragedies especially, where the interest of the reader is intensely excited by the great art shown in the minute delineation of a particular passion, and where he is forced to forget the artificial theory of the author. The most popular as well as the most powerful of her works is the tragedy of *De Montfort*. It was brought out at Drury Lane in 1800, Kemble and Mrs Siddons taking the leading parts. Her *Family Legend*, produced at Edinburgh under Scott's auspices in 1810, was a great success. Many of Miss Baillie's minor pieces are marked by a sprightly grace of versification, and a playful serenity of spirit, which pleasantly remind one of her personal character. She was under middle size, but not diminutive; her form was slender, and her countenance showed talent, worth, and decision. See Lady Richmond Ritchie's *Book of Sibyls* (1883), and Margaret Carhart, *Life and Work of Joanna Baillie* (1923).

Baillie, MATTHEW, anatomist, brother of the above, was born in Shotts manse in 1761. His mother was a sister of the two celebrated anatomists, William and John Hunter; and Matthew, after seven years at Glasgow and Oxford (1773-80), studied anatomy under his uncle William, with such success, that in 1783 he was found qualified to succeed to his practice and lectureship. Working often sixteen hours a day, he made a very large income—one year, £10,000—so that he purchased the estate of Duntisborne in Gloucestershire, and at his death there, on 23d September 1823, left a fortune besides of £80,000. His works, with a *Life by Wardrop*, appeared in 2 vols. in 1825. The most important is on *Morbid Anatomy*, published in 1795.

Baillie, ROBERT, Presbyterian divine, was born at Glasgow in 1599, and educated at the university of that city. In 1622 he received episcopal ordination, and was shortly after presented to the parish church of Kilwinning. In 1637 he refused to preach in favour of Laud's service-book; and in 1638 he sat in that famous General Assembly which met in Glasgow to protest against the thrusting of Episcopacy on an unwilling people, but conducted himself with greater prudence and temperance than was quite agreeable to his excited brethren. However, he soon threw himself eagerly into the national cause, and served as a chaplain in the Covenanting army at Duns Law (1639). In 1640 he was selected by the Scottish leaders to go to London, with other commissioners, and draw up charges against Archbishop Laud. On his return to Scotland in 1642,

he was appointed joint-professor of Divinity at Glasgow, along with Mr David Dickson. In 1643 he was again sent to London as a delegate to the Westminster Assembly of Divines, where he conducted himself in an unobtrusive manner, but cordially concurred in the doctrines which were drawn up. It is curious to notice that, though he had himself experienced the injustice of intolerance, he yet, like almost every other theologian of his age, vehemently discarded the principle of toleration, and asserted the divine right of Presbytery with no less emphasis than Laud did that of Episcopacy. In 1649 he was chosen by the church to proceed to Holland, and to invite Charles II. to accept the Covenant and crown of Scotland. He performed his mission skilfully; and, after the Restoration, through Lauderdale's influence, he was made Principal of Glasgow University. He died July 1662. His pamphlets and larger works, fourteen in number, are well-nigh forgotten; but his *Letters and Journals*, edited by David Laing for the Bannatyne Club (3 vols. 1841-42), are a valuable contribution to our knowledge of the times.

Baillie, ROBERT, of Jerviswood, the 'Scottish Sidney,' was a native of Lanarkshire, who first came into notice in 1676 through his rescue of a brother-in-law, the Rev. Mr Kirkton, from the clutches of Archbishop Sharp's principal informer. For this he was fined 6000 merks (£318), and, refusing to pay, was sent to prison; but so strong was the indignation of the Scottish gentry, that he was released at the end of four months, on payment of half the fine. In 1683 he took a prominent part in a scheme of emigration to South Carolina, as he saw no other refuge from the degrading tyranny of the government. About the same time, however, he entered into correspondence with the heads of Monmouth's supporters in London, Russell and Sidney, and subsequently repaired there to concert measures for securing adequate reforms. On the discovery of the Ryehouse Plot, he was arrested and sent down to Scotland. Accused of conspiring against the king's life, and of hostility to monarchical government, he was tried at Edinburgh, and condemned to death upon evidence at once insignificant and illegal. His bearing, both on his trial and during his imprisonment, was such that his cousin, Bishop Burnet, declared 'it looked like a reviving of the spirit of the noblest of the old Greeks or Romans, or rather of the primitive Christians and martyrs.' The barbarous sentence for high treason was carried into execution on the very day that it was passed, 24th December 1684.

Bailly, JEAN SYLVAIN, a famous French astronomer, President of the National Assembly of 1789, and Mayor of Paris, was born in that city, September 15, 1736. From art he turned aside to literature, but was fortunately induced by Lacaille to study astronomy, which proved to be the true sphere of his genius. He was early admitted to the Académie des Sciences, and he justified his honours by a succession of learned and elegantly written treatises on astronomical subjects, which culminated with his great *Histoire de l'Astronomie* (5 vols. 1775-87). Elected to the Académie Française (1784), and next year to the Académie des Inscriptions, he was thus a member of the three academies at once, an honour that had fallen to no one before him save Fontenelle. The revolution interrupted his peaceful studies. Elected President of the National Assembly, June 17, 1789, and Mayor of Paris on the 15th of July, he conducted himself in these capacities with great integrity and purity of purpose; but at last lost his popularity by allowing the National Guard to fire on the masses who were assembled in the Champ de Mars, on the 17th of July 1791, to demand the dethronement of the

king. He now threw up his mayoralty, withdrew altogether from public affairs, and went to live first at Nantes, and afterwards with his friend Laplace at Melun. Here he was seized by the Jacobin soldiery, and brought to Paris, where he was accused of being a royalist conspirator, condemned and executed with the usual Jacobin preliminary of savage insult, November 11, 1793. From his papers were published his *Essai sur l'Origine des Fables et des Religions Anciennes* (2 vols. 1799), and his *Mémoires d'un Témoin de la Révolution* (3 vols. 1804). See Nourrisson, *Trois Révolutionnaires. Turgot, Necker, Bailly* (1885).

Bailment, in English law, means the delivery of goods in trust for some special purpose, on a contract, express or implied, to conform to the purpose of the trust. Deposits, pledges, or pawns, contracts for hiring goods, and gratuitous loans, are all varieties of bailment. In the United States the same definition applies. Practically, bailments are of three kinds: (1) for the benefit of the bailor or his representative; (2) for the benefit of the bailee or his representative; (3) for the benefit of both parties. In the first case, as when a person receives the goods of another to keep without recompense, he is responsible only for gross neglect; in the second, he is responsible for the slightest neglect; in the third case, the bailee is bound only to ordinary care and diligence. Bailees, such as warehousemen, innkeepers, and common carriers, have a lien on the property bailed for their charges.

Baily, EDWARD HODGES, sculptor, was born at Bristol, 10th March 1788. Two Homeric studies which he had executed were praised by Flaxman; and in 1807 he went to London, saw Flaxman, and entered his studio. He won several medals; but his 'Eve at the Fountain' (1818) first established his reputation. George IV. employed him, along with other artists, to execute the sculpture in front of Buckingham Palace, the figures on the Marble Arch, and the 'Triumph of Britannia.' Besides these, Baily executed a great number of busts and statues—Wellington, Byron, Telford, Earl Grey, and Sir Astley Cooper. The statue of Nelson, in Trafalgar Square, is likewise his, as also those of Charles James Fox and Lord Mansfield in St Stephen's Hall, Westminster. His 'Eve listening to the Voice,' 'Sleeping Nymph,' 'Girl preparing for the Bath,' and 'The Graces Seated,' are among his finest efforts. He died 22d May 1867.

Baily, FRANCIS, astronomer, was born at Newbury, Berks, 28th April 1774. An apprenticeship in a London mercantile house was followed by a few years of roving, but at the age of 25 he settled down as a stockbroker in London. In financial business he showed great capacity, and he gradually acquired a large fortune. Meantime he published a series of excellent books on questions involved in banking and assurance. At 51 he retired from business to devote himself entirely to astronomy. Scientific honours were soon showered upon him both from home and abroad. Among the chief of the services rendered to his chosen subject through his unwearied industry, were his share in the foundation of the Astronomical Society, and in the improvement of the *Nautical Almanac*, his laborious repetition of Cavendish's experiment to measure the density of the earth (see EARTH), and the production of the Astronomical Society's Star-catalogue. The latter, says his biographer, Sir J. Herschel, 'put the astronomical world in possession of a power which may be said, without exaggeration, to have changed the face of sidereal astronomy. Baily's writings, ninety-one in number, included a *Life of Flamsteed* (1835), but

mostly appeared in the *Astronomical Society's Memoirs*. He died in London, 30th August 1844.

Baily's Beads, the name given to a phenomenon in connection with eclipses of the sun, first fully described by Francis Baily. Just before the beginning and after the end of the obscuration by the moon of the sun's disc, the thin crescent-shaped unobscured portion of the sun seems usually to become suddenly discontinuous, and looks like a belt of bright points, varying in size and separated by dark spaces. The resulting appearance has been compared to a string of beads. The phenomenon is an effect of irradiation and the inequalities of the moon's edge. To irradiation it is also due that, by defect of the retina of the eye, bright objects seen on a dark ground seem larger than they really are.

Bain, ALEXANDER (1818-1903), writer on mental philosophy, was born at Aberdeen. Educated at the university of his native city, he lectured there as deputy-professor for a few years, afterwards taught Natural Philosophy at the Andersonian University, Glasgow, filled the office of assistant-secretary to the Metropolitan Sanitary Committee and the Board of Health, examined in mental philosophy for the university of London and the Indian Civil Service, and was appointed in 1860 to the chair of Logic in Aberdeen. He resigned in 1881, and the same year was elected Rector of his university. In 1859 he was made LL.D. by the Edinburgh University. Bain's chief works are *The Senses and the Intellect* (1855), and *The Emotions and the Will* (1859), completing a systematic exposition of the phenomena of the human mind. Other books are *Mental and Moral Science, a Compendium of Psychology and Ethics* (1868); *Logic, Deductive and Inductive* (1870); *The Relation of Mind and Body* (1873); *Education as a Science* (1879). He wrote also a biography of James Mill (1881), as well as a criticism of John Stuart Mill (1882), besides several handbooks of English grammar; he assisted in editing Grote's *Aristotle*, and edited Grote's *Minor Works*. In philosophy, Bain was a conspicuous representative of the empirical or experimental school, in opposition to the *a priori*, or transcendental. His psychology is based on physiology, after the manner of Hartley's; but instead of considering the human organism as capable only of receiving impressions and of acting in response thereto, he finds in it a power of originating active impulses (Spontaneity), and thus obviates many of the defects alleged by *a priori* philosophers to inhere in the system of sensationalism, as hitherto exhibited. His two chief works were pronounced by J. S. Mill to be the most careful, the most complete, and the most genuinely analytical exposition of the human mind which a *posteriori* psychology had produced. See ASSOCIATION OF IDEAS, and his *Autobiography* (1904).

Baini, GIUSEPPE, musician, was born at Rome in 1775, and was director of the pope's choir from 1814 till his death in 1844. The severe gravity and profound science of his compositions contrasted strongly with the careless style and shallow dilettanteism of most of his contemporaries; but less by his compositions than by his historical researches did Baini secure for himself a prominent place in musical literature. His principal work is his *Life of Palestrina* (1828).

Bairaktar (more correctly, Bairak-dar), signifying 'standard-bearer,' is the title of the energetic Grand-vizier Mustapha. Born in 1755, of poor parents, he entered the military service at an early age, and soon distinguished himself by his valour. When he was pasha of Rustchuk in 1806, he fought with some success against the Russians, and after the revolt of the janissaries in 1807, by

which Selim III. (see TURKEY) was deposed in favour of Mustapha IV., Bairaktar marched his troops to Constantinople, where they found the dead body of Selim lying in the first court of the seraglio. Bairaktar executed all those who had had any share in the murder, deposed Mustapha IV., and proclaimed the brother of this prince, Mahmoud II., sultan on the 28th July 1808. Bairaktar was now appointed grand-vizier, and endeavoured to carry out Selim's reforms, and to strengthen the regular army. His chief object was the annihilation of the janissaries; but, favoured by the fanatical people, these prætorians rebelled, and, with the support of the fleet, attacked the seraglio on the 15th November 1808, and demanded the restoration of Mustapha IV. Bairaktar defended himself bravely; but when he saw that the flames threatened to destroy the palace, and that he was in danger of falling alive into his enemies' hands, he strangled Mustapha, threw his head to the besiegers, and then blew himself up.

Bairam, the Persian and Turkish name for a Mohammedan festival somewhat analogous to Easter. It commences immediately after the fast of Ramadan, or Ramazan, which corresponds in its abstinence to Lent. Being one of the two great feasts of the Moslems, it is looked forward to with great interest, the zest being enhanced by the previous abstinence. Properly, it should terminate in one day, but the festivities are generally protracted over three days. Seventy days after, the Moslems celebrate the second Bairam ('the festival of the sacrifices'), instituted in commemoration of the offering up of Isaac by Abraham, on which all the faithful of Islam must sacrifice victims. The second Bairam usually lasts four days. The Mohammedan year being the lunar one of 354 or 355 days, in about thirty-three years the festivals run through all the seasons. In 1887 the first Bairam fell on the 23d June, in 1919 on the 30th, in 1920 the 18th.

Baird, SIR DAVID (1757-1829), born at Newbyth, East Lothian, entered the army in 1772, and in 1779 sailed to India as captain in a Highland regiment. He was soon in the midst of a sanguinary war. In July 1780, Hyder Ali burst into the Carnatic at the head of 100,000 men, disciplined and commanded by French officers. A portion of the English army fell into an ambuscade and was cut to pieces. Among the few who remained alive to be taken prisoners was Baird. He was thrown into a dungeon at Seringapatam, where he endured a captivity of nearly four years. In March 1784 he was released, and after a two years' visit to England (1789-91), he took part in several important sieges, attacks, and skirmishes; till in 1799, now a major-general, he memorably signalled himself at the victorious assault of Seringapatam. He led the storming-party, Colonel Wellesley (afterwards Duke of Wellington) commanding the reserve. Baird indignantly complained when Wellesley received the appointment of governor of Seringapatam, which he felt was due to his own services. He commanded an expedition sent to Egypt in 1801 for the expulsion of the French. On his return to India in 1802, he found that the star of Wellesley was in the ascendant; and Baird applied for leave of absence. He was received at court with great distinction, knighted in June 1804, and made a K.C.B. in the following August. In 1805-6 he commanded the expedition which finally wrested from Holland the Cape of Good Hope. In 1807 he commanded a division at the siege of Copenhagen; and in 1808 was sent to Spain with an army of 10,000 men, to assist Sir John Moore. He distinguished himself in the battle of Corunna, January 16, 1809, when his left arm was shattered by grape-shot, and

had to be amputated. On the death of Moore, he succeeded to the command. On this occasion he received, for the fourth time in his life, the thanks of parliament, and was created a baronet. He retired from active service in 1810, and in 1820 was made commander of the forces in Ireland. He died at Clieff. See *Lives* by Theodore Hook (1832) and W. H. Wilkin (1913).

Baird, JAMES, ironmaster, was born at Kirkwood, Lanarkshire, 5th December 1802. The fourth son of Alexander Baird, a coal-master, he was educated at Old Monkland, and was for a short time at Glasgow University. In 1826 he was associated with his father and two brothers, William and Alexander, in the leasing of coal-fields at Gartsherrie and elsewhere. Blast-furnaces were added in 1830, and James Baird assumed the active management. Between 1842 and 1864 the blast-furnaces at Gartsherrie, Eglinton, Muirkirk, and elsewhere increased from sixteen to between forty and fifty, capable of turning out 300,000 tons of iron annually, and employing 10,000 men and boys. As the firm increased in wealth, estates to the value of £2,000,000 were acquired by the brothers. James Baird represented the Falkirk burghs in 1851-52 and in 1852-57. In later years he built and endowed various schools, founded the 'Baird Lectures' for the defence of orthodox theology in Scotland in 1871, and in 1873 gifted to the Church of Scotland a sum of £500,000, 'to assist in providing the means of meeting, or at least as far as possible promoting the mitigation of, spiritual destitution among the people of Scotland.' He died at his seat of Cambusdoon, near Ayr, 20th June 1876. He was twice married, but left no family. His property was valued at £3,000,000. See Baird's *Bairds of Auchmedden* (1870).

Baird, SPENCER FULLERTON, LL.D., an American naturalist, was born at Reading, Pennsylvania, 23d February 1823. He was educated at Dickinson College, Carlisle, and became professor of Natural Science there in 1846. In 1850 he was elected assistant-secretary of the Smithsonian Institution at Washington, and in 1878 secretary. He translated from the German and edited the *Iconographic Encyclopædia*; and published Reports on the collections in natural history made by Stansbury, Gilliss, Marcy, and others in the government explorations. In connection with John Cassin, he published *The Birds of North America* (2 vols. 1860), and *The Mammals of North America* (1859); and with Dr Brewer and Professor Ridgway, *History of the Birds of North America* (5 vols. 1870-84). Dr Baird published numerous other papers upon mammals, birds, reptiles, and fishes. In 1871 he was appointed by the president United States Commissioner of Fish and Fisheries, and in that capacity he accomplished much towards the advancement of fisheries and fish-culture, accounts of the results of this work being embodied in annual Reports. His especial work, while assistant-secretary of the Smithsonian Institution, was the development of the National Museum, which made its beginning under his direction in 1850. A bibliography of his publications, with a biographical sketch, constitutes Bulletin No. 20 of the National Museum. He died 19th August 1887. See his *Life* by W. H. Dall (1915).

Baireuth, or BAYREUTH, capital of the Bavarian province of Upper Franconia, 43 miles NNE. of Nuremberg by rail. Beautifully situated on the Red Main, it has broad, well-paved streets, interspersed with groves, promenades, fine gardens, and public fountains. Its principal buildings are the old palace, dating from 1454; the new palace (1753), containing a gallery of paintings; and the old opera-house (1748). A magnificent

'national theatre' for the performance of Wagner's music, finished in 1875, was in the following year opened with a grand representation of his Nibelungen trilogy. On 14th February 1883, the great master (who died at Venice) was buried in the garden of his villa here. Baireuth's chief articles of industry are cottons, woollens, linen, leather, tobacco, parchment, and porcelain. An active trade is also carried on in grain and horses. Jean Paul Richter died here in 1825, and a monument has been erected to his memory. Pop. 32,000, of whom only 15 per cent. are Catholics. The witty and accomplished Wilhelmina, Margravine of Baireuth (1709-58), was the favourite sister of Frederick the Great, and in 1731 was married to Frederick, Margrave of Baireuth and Anspach. Her *Memoirs*, first published in 1810, were translated into English by the Princess Christian in 1887.

Bairns' Part. See LEGITIM.

Baitul. See BETUL.

Baize (old Fr. *baies*), a coarse woollen cloth with a long nap, used mainly for coverings, curtains, linings, but in some countries for clothing.

Baja, a market-town of Hungary, on the Danube, 90 miles S. of Budapest. It is celebrated for its annual swine fair, and its trade in grain and wine. Pop. 20,000.

Bajan. See BEJAN.

Bajaur, a small territory (375 sq. m.) in the NW. Frontier Province of India, bordering on Swat and Afghanistan.

Bajazet I., or BAJAZID, Sultan of the Turks, was born in 1347, and in 1389 succeeded his father, Murad I., who was slain on the battlefield of Kossovo. He inaugurated his rule by strangling his younger brother Yakub, lest he should dispute the succession. In three years he conquered Bulgaria, with parts of Serbia, Macedonia, and Thessaly; he also subdued the greater part of Asia Minor. From the rapidity with which these extraordinary conquests were effected, he received the name of Ilderim—that is, 'Lightning.' He even blockaded Constantinople itself for ten years, thinking to subdue it by famine. To rescue this city, King Sigismund of Hungary (afterwards emperor of Germany) assembled a large army, including 2000 French nobles, and laid siege to the Bulgarian city of Nikopolis, on the Danube. Bajazet hastened to meet him, and gained a decisive victory over the allied Hungarians, Poles, and French (1396). Sigismund escaped, but the greater part of the French, through whose impetuosity the battle was lost, were taken prisoners, and were nearly all executed. Bajazet would now have entirely destroyed the Greek empire, if he had not been prevented by Timur (q.v.), who attacked his possessions in Asia Minor, and completely defeated him (1402) near Angora. Bajazet himself fell into the hands of the conqueror, who treated him with great generosity. The story popularised by Marlowe and Racine, that he was carried about imprisoned in a cage, is without historical foundation, and is probably based on a mistranslation of a Turkish word signifying 'litter.' Bajazet died in 1403, in the camp of Timur. He was succeeded in the government by his son Soliman I. Bajazet was honourably distinguished by his efforts to improve the administration of justice.

Bajazet II., son of the Sultan Mohammed II., the conqueror of Constantinople, was born in 1447, and ascended the Ottoman throne after his father's death in 1481. His reign, which lasted 32 years, was a succession of uninterrupted wars against

Hungary, Poland, Venice, Egypt, and Persia, which were carried on with various success, and which served on the whole to establish the Ottoman power. The submission Bajazet always showed to the wishes of the Janizaries (q.v.) laid the foundation of the later importance of that body. The last years of his reign were much disturbed by disputes between his three sons about the succession to the throne. Influenced by the preference shown by the janissaries for his youngest son Selim, Bajazet abdicated in his favour, but died before he could reach the place of his voluntary exile, in the neighbourhood of Adrianople, in the year 1512. Bajazet was a friend to the dervishes, at the same time liberal and fond of pomp and splendour. Many of the most beautiful mosques in the Ottoman empire were built by him.

Bajimont. See BAGIMONT.

Bajmok, a town of Yugoslavia, in the Bačka, 16 miles SW. of Subotica or Theresiopel; pop. 8000.

Bajocco, or BAIOTTO (pl. BAJOCCHI), was a copper coin in the Papal States, value nearly a halfpenny. It was 1-100th of the scudo, which was equal to 4s. 3½d.

Bajus, MICHAEL (properly, De Bay), a great Catholic theologian in the 16th century, was born in 1513 in Hainault. He studied at Louvain, became professor of Theology there in 1551, and went as a deputy to the Council of Trent in 1563. He was a devoted student of St Augustine, and his theology was based on that father's views of divine grace, of sin, and of the absence of merit in all good works. His assertion of the inability of the human will, left to its own freedom, to do anything but sin, with his application thereof to the dogma of the immaculate conception, soon drew on him the accusation of heresy. Seventy-six of his propositions were condemned by a papal bull in 1567. He submitted, but was supported by his university, which appointed him its chancellor in 1578. Meantime he maintained a long controversy with the Jesuits, and in 1587 denounced thirty-four of their theses as Pelagian and immoral. He died December 16, 1589. He may be regarded as a precursor of the Jansenists. See Linsenmann, *Michael Bajus* (1867); and Seeweg in Hauck-Herzog (1897).

Bajza, JOSEPH, a Hungarian poet and prose-writer, was born January 31, 1804, at Szűcsi, in Heves. After his studies at Pesth, he practised there as an advocate, and early gained by his first volumes of verse, published in 1835, a place among the best Hungarian lyric poets. As a contributor to the critical journals, and as editor of the *Független* (Observer) from 1837-43, he exercised a beneficial influence on the rising literature of Hungary. He translated a collection of foreign dramas (1830); and published an Historical Library (from the German) in 6 vols., a Modern Plutarch, and a Universal History. He died at Pesth, 4th March 1858.

Bakacs, THOMAS, Hungarian statesman, was the son of a peasant, born about the middle of the 15th century. He held several bishoprics in succession, became chancellor of the kingdom, and finally archbishop and cardinal. He preached a crusade against the Turks; but his army of peasants and vagabonds turned their arms against the nobility, and a bloody civil war ensued. He died in 1521, leaving enormous wealth.

Bakalahari, the name of a Bechuana tribe resident in the Kalahari desert, between the Orange River in the south and Lake Ngami in the north, in Africa. They show some disposition for settled life and industrial pursuits, cultivating the soil, and rearing goats.

Bakar. See BUCCARI.

Bakarganj, or BACKERGUNGE, a district in the Dacca division of Bengal, contains 4542 sq. m., and is watered at once by the lower streams of the Ganges and the Brahmaputra. It is typical of the alluvial delta formed by the great river systems of Eastern Bengal. In the south of the district are the forest tracts of the Sunderbunds. Barisal, the headquarters, on the west bank of Barisal River, is the only considerable town. Bakaiganj the former capital, is now in ruins. The population is over 2,400,000.

Bakau, or BACAU, a Rumanian town, on the river Bistritza, 187 miles N. of Bucharest by rail, produces petroleum and salt; pop. 20,000.

Bakhiserai (Turkish, 'Garden Palace'), a town in the Russian government of Taurida, the residence of the ancient princes or khans of the Crimea, stands in a deep limestone valley, 15 miles by rail SW. of Simferopol. Population, 15,000, mainly remnants of the old Tatar inhabitants. The palace (1519) of the khans has been completely restored by the Russian government in the oriental style.

Bake, JAN, a distinguished classical scholar, was born at Leyden in 1787; from 1817 to 1857 was professor of Greek and Roman literature in the university there, and died 26th March 1864. He edited works by Cicero, Longinus, and others; and wrote many admirable critical papers.

Bakel, a town with a strong fort, in the E. of the French colony of Senegal, on the left bank of the Senegal River. Pop. 3000.

Baker, MOUNT, an active volcano in the NW. of the state of Washington, U.S., in the Cascade Range, a continuation of the Rocky Mountains, 20 miles from the Canadian frontier. It is in eruption from time to time, and was very active in 1880. Its height is 11,000 feet.

Baker, HENRY, naturalist, born in London in 1698, from a bookseller's apprentice turned a teacher of deaf-mutes, and, making a largish fortune, in 1729 married Defoe's youngest daughter. In 1740 he was elected a Fellow both of the Royal Society and of the Society of Antiquaries. He contributed many papers to the Transactions of the former society, received its Copley gold medal (1744) for his microscopical experiments, and published a philosophical poem on the *Universe*. He was founder of the Bakerian lectureship, and died 25th November 1774.

Baker, JOHN GILBERT, botanist, was born at Guisbrough, Yorkshire, 13th January 1834, and in 1866 was appointed assistant-curator at the herbarium at Kew. He was lecturer to the London hospital, and to the Apothecaries' Company, and in 1890-99 was keeper of Kew herbarium. He was a Fellow of the Royal and Linnæan Societies. His voluminous writings include works on the flora of districts so diverse as the north of England, Madagascar, and Brazil; and from his pen came both popular monographs and scientific catalogues of high value. He died in August 1920.

Baker, SIR RICHARD, author of the *Chronicle of the Kings of England*, a work without which no country gentleman's library was complete, and often referred to by 'Sir Roger de Coverley.' Notwithstanding its reputation, however, the book had no lack of errors, and now is all but forgotten. Its author, born in Kent about the year 1568, was educated at Oxford University, and was knighted in 1603. In 1620 he was high-sheriff of Oxfordshire; but in 1635 he was thrown into the Fleet Prison for debt which his wife's family had contracted, but for which he had become responsible. Here he wrote his *Chronicle*, first published in 1643,

besides several pious works of less note. He died a prisoner, in great poverty, in 1645.

Baker, SIR SAMUEL WHITE, an African traveller, born in London, June 8, 1821, was educated at a private school and in Germany, and at an early age went to Ceylon. There, along with his brother, he established in 1847 an agricultural settlement and sanatorium at Newera Ellia, 6200 feet above sea-level. He afterwards superintended the construction of the railway which connects the Danube across the Dobrudja with the Black Sea. In 1860 he married a young Hungarian lady of great talent and enterprise, and in company with her he undertook a journey of exploration at his own cost for the discovery of the Nile sources. They set out from Cairo in April 1861, reaching Khartum in June 1862. When Baker quitted Khartum to ascend the White Nile, he had an escort of 90 persons, 29 camels, horses, and asses, and three large boats. They had only been at Gondokoro a fortnight, when they were joined by Speke and Grant coming from the south, who told Baker of the Victoria Nyanza, which they had discovered; they also mentioned that the natives had described to them another great lake, named Luta Nziye. Baker resolved to reach this lake; and after many adventures, they arrived, on 14th March 1864, on the top of lofty cliffs, from which they beheld the vast inland sea to which Baker gave the name of the Albert Nyanza. He reached Gondokoro on March 23, 1865. In 1869-73 he commanded an expedition, organised by the pasha of Egypt, for the suppression of slavery and the annexation of the equatorial regions of the Nile Basin. After the British occupation of Cyprus in 1879, he made a thorough exploration of the island, and afterwards journeyed through Syria, India, Japan, and America. Baker was knighted in 1866; on his return from the Nile, he received medals from the Royal Geographical Society, and the French Geographical Society. He was F.R.S., and a fellow of other learned societies; and had numerous foreign distinctions. He died at his home near Newton-Abbot, 30th December 1893. He published *The Nile and the Hound in Ceylon* (1854); *Eight Years' Wanderings in Ceylon* (1855); *The Albert Nyanza* (1866); *The Nile Tributaries of Abyssinia* (1867); *Ismaïlia* (1874); *Cyprus* (1879); and *Wild Beasts and their Ways* (1890). See his Life by Murray and Silva White (1895).

Baker, THOMAS, antiquary, was born at Lanchester, Durham, in 1656, and educated at St John's College, Cambridge. As a non-juror, he lost in 1690 the rectory of Long-Newton, and in 1717 his fellowship, but he spent the last fifty years of his life at his old college, dying there in 1740. He published *Reflections on Learning*, and made valuable MS. collections on the history of the university, amounting to 42 folio volumes; whilst his *History of St John's College* was edited by Professor Mayor in 1867.

Bakewell, an ancient market-town in Derbyshire, on the left bank of the Wye, 25 miles NNW. of Derby. It has warm baths and a mineral spring, a fine but over-restored church, with an 8th or 9th century cross, and charming environs, Haddon Hall and Chatsworth being not far off. Pop. (urban district) 3000.

Bakewell, ROBERT, grazier, was born in 1725 at Dishley, Leicestershire, and died in 1795. His fame rests on his successful efforts to improve the breed of domestic animals. His reputation was so great as a breeder of sheep, that he received the almost fabulous sum of 1200 guineas for one season of a ram. The long-horned breed of cattle which he produced is still remembered as the Dishley or New Leicestershire breed. His horses were also

famous, and almost as profitable to him as his sheep. One of his objects was to produce a breed of animals that would fatten on the smallest quantity of food. Yet he was bankrupt in 1776.

Bakhmut, a town of Ukraine, in the government of Ekaterinoslav, on a tributary of the Donetz. There are large works for melting tallow and wax, salt-springs, and near by valuable coal-mines and alabaster quarries. Pop. 20,000.

Bakhtegan, or NIRIS, a salt lake in the Persian province of Farsistan, 47 miles E. of Shiraz, 74 miles long, and 5100 feet above the sea.

Bakhtiari, a nomad tribe of Persia (q.v.), akin to the Lûris, occupying the mountainous Bakhtiari country to the west of Ispahan.

Baking is the mode of cooking food in an airtight chamber or oven. The term is also applied in the manufacture of Bricks (q.v.), Pottery (q.v.), &c. The baking of bread will be treated under BREAD. The oven that forms part of a kitchen-range is simply an iron chamber, with flues for conveying the heated gases of the fire round it. In baking, strictly so called, the oven is kept close, so that the steam and aroma arising from the inclosed substances are confined; but a great improvement is effected if a current of air is produced by ventilators. The rank taste that often characterises baked dishes is thus avoided; and the process may then be called *oven-roasting*. Ovens are sometimes heated by water (superheated), and frequently now by gas. Meat for baking is placed in a dish, from the bottom of which, in some cases, it is raised on a wire frame or trivet.—Baking, although a convenient mode of cooking meat, is not considered quite so good as roasting. See also OVEN.

Baking Powder is essentially a mixture of tartaric acid and bicarbonate of soda. These are carefully dried and sifted together, some flour being usually mixed with them to dilute the strength. When it is added to flour in the manufacture of bread or scones, carbonic acid gas is liberated by the action of the water which is used, and this blows or puffs up the doughy mass, giving it the requisite lightness. Frequently the bicarbonate of soda is alone used, buttermilk or the natural acidity of the dough being depended on to evolve the gas. See BREAD.

Bakony Wald (Forest of Bakony), a densely wooded hill-country of Hungary, extending from Lake Balaton northward to the Danube, and dividing the great and little Hungarian plains. Immense herds of swine are annually driven hither to feed upon the mast of the forest. The swineherds furnished those notorious robbers who play so important a part in the ballads of the Hungarian people, and in the imagination of travellers. Its length is about 55 miles, its breadth 25 miles.

Bakshish. The ordinary meaning of this word in Persian is a present; but in the East, in modern times, it has acquired the special significance of gratuity (Fr. *pourboire*, Ger. *Trinkgeld*).

Baku, capital of the Azerbaijani Republic, a great port on the Apsheron Peninsula, on a crescent-shaped bay in the Caspian Sea. The bay, which is about 7 miles from point to point, and 15 in circumference, is protected across the mouth by an island, which provides shelter and anchorage for shipping. Since 1883 it has been connected by rail with Tiflis, and so with Poti and Batum on the Black Sea, 561 miles distant; and since 1887, by the North Caucasus Railway, with Novorossisk on the Black Sea. The whole soil around Baku is impregnated with petroleum, which, monopolised till 1872, now forms the staple branch of its industry. Some of the fountains ignite spontaneously, and this natural phenomenon has

caused Baku to be esteemed as a holy city by the Parsees or fire-worshippers, many of whom resorted to it from very long distances (see *ATESHGA*), although commerce has now invaded the sacred shrine. There is evidence that petroleum has been flowing from the Apscheron Peninsula for 2500 years. Most of the petroleum-wells at Baku are situated on the Balakhani Peninsula, 8 or 9 miles to the north of the town. Lines of pipe carry the oil into the 'black town' of Baku, which is full of oil-refineries emitting vast volumes of smoke, black and greasy buildings, and pools of oil refuse. One prolific well, tapped in September 1886, began to spout oil with extraordinary force, deluging the whole district. Nothing could be done to stop the outflow, which on the eighth day had reached a daily rate of 11,000 tons, or more than the entire produce of the world at the time. Another gigantic naphtha fountain burst out in March 1887, rising to a height of 350 feet, and after forming an extensive petroleum lake, forced its way into the sea. Great and destructive fires have occasionally occurred, as in 1887, when over 14,000 tons of stored naphtha was consumed in a conflagration which raged for five days. The oil is conveyed by pipe to Batum, or carried by tank-steamers and railway cars. How rapidly the industry grew when communication was established with the outside world may be judged from the fact that the number of drilled wells increased from 1 in 1871 to 400 in 1883, 1321 in 1900. Cotton, silk, opium, saffron, and salt are exported. The Arabian Masudi is the first who mentions Baku, about 943, and he gives an account of a great volcanic mountain in its vicinity, which is now extinct. Baku was taken by Russia from the Persians in 1806. The marvellous development of the petroleum trade has revolutionised the place. There is a fine railway terminus near the town. The harbour, which is strongly fortified, was one of the chief stations of the Russian navy in the Caspian, and is of great importance as a centre of trade. Shipbuilding is carried on. Pop. in 1870, about 15,000, mainly Persians and Armenians; now about 250,000. In 1905 there were bloody riots between Tatars and Armenians. Many wells were burnt out and trade dislocated. Baku was capital of a government of Russian Transcaucasia, which, with Elizabetpol, became in 1918 the republic of Azerbaijan, with Baku as capital. See works by Marvin (1884 and 1886) and Hendry (1906); also the article *PETROLEUM*.

Bakunin, *MIKHAIL*, a leading propagator of Anarchism (q.v.), was born near Moscow in 1814 of an aristocratic family, and entered the Russian army, but during service in Poland conceived such a hatred of despotism that he resigned his post. After 1846 he visited Germany, and also Paris, where he met Proudhon and George Sand. He took part in the German revolutionary movement of 1848-49, especially at Dresden, and was condemned to death. He was, however, given up to Russia, where he spent several years in prison, and was next sent to Siberia in 1855, but managed to escape in an American ship to Japan, leaving behind him wife and child, and arrived in England in 1861. In 1865 Bakunin was in Italy diffusing his views. In 1869 he founded the Alliance of the Social-democracy, which dissolved the same year in order to enter the International; in September 1870 he attempted a rising at Lyons, with an aim somewhat similar to that of the Paris Commune in 1871. As the leader of anarchism, Bakunin was in the International the opponent of Karl Marx; but at the Hague Congress in 1872, he was outvoted and expelled from it. He died at Berne in 1876. Bakunin was most active as an agitator. He wrote several works, in which atheism, material-

ism, and anarchism are advocated in the frankest and most uncompromising manner.

Bala, a town of Merionethshire, North Wales, near the foot of Bala Lake, 12 miles SW. of Corwen by rail; pop. 1400. Bala Lake measures 4 miles by 1 mile, and sends off the Dee from its foot. From Lake Vyrnwy (q.v.), 10 miles to the south of Bala, Liverpool obtains water.

Balaam, the name of a prophet not of Hebrew blood, mentioned in Numbers xxii.-xxiv. According to the story, Balak, king of the Moabites, alarmed at the irruption of the Hebrews into his territories, formed a league with the Midianites, and sent messengers to Balaam with the rewards of divination in their hands. Refused permission from God, he consented to go only after a second summons from the king. On the way the angel of the Lord met him. The prophet's ass saw the apparition, and three different times turned aside out of the way in terror. Balaam, not seeing the angel, beat his ass three times, whereupon the beast opened his mouth, and 'spoke with man's voice, and stayed the madness of the prophet.' At last his eyes were opened to see the angel, and he was denounced for his sin. Three different times he tries to curse Israel for Balak, but as often the cursings turn to blessings in his mouth, and he breaks out into the loftiest strains of prophetic poetry in praise of the glorious destiny of Israel. But though he could not belie the prophetic function by cursing the Israelites, he succeeded in causing them for a time to forfeit the favour of Jehovah, by leading them into sin through a special temptation which Balak and the Moabites on his advice spread before them. The prophet perished in the vengeance taken by the command of Jehovah upon the sinners. Such is the strange story of the true prophet 'who loved the hire of wrong-doing,' and who is taken in the Scriptures as the constant type of those men who prostitute their powers and hold the truth in unrighteousness, receiving the wages thereof.

Bala Beds. The rocks of the Bala district, North Wales, contain two limestones, separated by some 1400 feet of arenaceous and slaty strata. The lower limestone (25 feet) is called the Bala limestone, and has been followed over a considerable area; the upper, or Hirnant limestone, is local. The lower, or Bala limestone, is supposed to be the same as the Coniston limestone of Westmorland. Bala beds form a group of the Lower Silurian or Ordovician. In the Snowdon region they attain a great thickness, and show intercalated sheets of felsitic lava and tuff, bespeaking long-continued volcanic action. See *SILURIAN*.

Balachong, a condiment much used in China for eating with rice, is made of putrid shrimps or small fish pounded with salt and spices and dried.

Bala'na. See *WHALE*.

Baleniceps ('whale-headed'), or Shoe-billed Stork, is a gigantic grallatorial bird found only on the Upper Nile. It has a large hooked very broad and flat bill, resembling that of the Boat-bill (q.v.), and lives mainly on lizards and other reptiles. The *Baleniceps rex* belongs to the *Umbres* subdivision of the stork family.

Balanop'tera. See *RORQUAL*.

Balaghat ('above the Ghats'), the name given to a large tract of elevated country in the south of India, extending from the rivers Tumbuddra and Krishna in the north to the farthest extremity of Mysore in the south. Also the name of a British district in the Central Provinces; area, 3132 sq. m.; pop. 400,000. See also *BERAR*.

Balahissar, a village on the site of the ancient *Pessinus*, in the south-western part of the province of Angora, in Asia Minor. The ancient

town was famous for its worship of Cybele, and among the fragments of marble columns, friezes, &c. use the ruins of her gorgeous temple and remains of a theatre in partial preservation, a castle, and a circus.

Balakirev, MILI ALEXEIVICH, Russian composer and pianist, born 31st December 1836 (o.s.) at Nijni-Novgorod, lived and studied with Ulibishev, biographer of Mozart, and going to St Petersburg at the age of eighteen, became leader of the national Russian movement in music. Cui, Mussorgsky, Rimsky-Korsakov, and Borodin were his disciples, and Tchaikovsky was influenced. In 1862 he established, with others, a Free School of Music which gave important concerts. Later he became conductor to the Imperial Musical Society and to the Tsar. He died in 1910. His compositions, few in number, include overtures and symphonic pieces, songs, and pianoforte music.

Balaklava, a small Greek fishing-village and health-resort in the Crimea, 8 miles S.E. of Sebastopol, from which it is separated by a rocky peninsula. The harbour, which affords secure anchorage for the largest ships, till 1860 was a naval station. It is perfectly landlocked, the entrance being so narrow as scarcely to admit more than one vessel at a time. To the east, overlooking the bay from a rocky eminence, are the ruins of a Genoese fortress. Balaklava is the *Symbolon Limen* of Strabo, and the *Cembalo* of the Genoese (1365-1475), who were expelled by the Turks, as these were in turn by the Russians, when Catherine II. made it the seat of a Greek colony. From September 1854 to June 1856 it was the British headquarters during the Crimean War (q.v.), and the famous charge of the Six Hundred (25th October 1854) has made the name glorious as Thermopylae.

Balalaika, a Russian peasants' musical instrument of the guitar type, commonly two-stringed.

Balance (from Latin *bilanx*), an instrument for ascertaining the mass of bodies. The ordinary balance consists of a symmetrical lever called a beam, supported in the middle, and having dishes or scales suspended from either extremity. As it is of importance that the beam should move easily round its support, it rests on polished agate or steel planes, by means of knife-edges of tempered steel, which project transversely from its sides, and serve as the axis of rotation. By this arrangement the surface of contact is practically reduced to a line, and the friction of the axis of the beam on its support almost entirely obviated. The scales are hung by means of chains or cords attached to hooks, which rest on knife-edges turned upwards instead of downwards as in the first case. The essential requirements of a balance of this description are: 1st, That the beam shall remain in a horizontal position when no matter is in either scale; 2d, That the beam shall be a lever of equal arms, or have the distances between the central knife-edge and those at either end exactly the same; and 3d, That the balance shall possess *sensibility*—i.e. shall turn readily from its horizontal position when there is a slight excess of matter in one of the scales. To insure the first of these conditions, it is necessary that the centre of gravity of the beam lie vertically below the point of support when the beam is horizontal. When such is the case, the centre of gravity at which the weight of the beam may be considered to act oscillates as in a pendulum round the point of support, and always comes to rest right under that point, thus restoring to the beam its horizontal position when it has been tilted out of it. If the centre of gravity were above the point of support, the beam would topple over; and if it coincided with that point, there being no restoring force, the beam would occupy indifferently any

position into which it was thrown, the balance in both cases being useless. That a balance possesses the second of the above conditions, is ascertained by putting into the scales masses which keep the beam horizontal, and then transposing them, when, if it still remain so, the lengths of the arms are equal. Should the arms be of different lengths, a less mass at the end of the longer arm will balance a larger mass at the end of the shorter arm (see LEVER); but when transposed, the larger mass having the longer arm, and the smaller mass the shorter, the beam can no longer remain horizontal, but will incline towards the larger mass. A balance with unequal arms is called a false balance, as distinguished from an equal-armed or just balance. When employing a false balance, it is usual to place a body in both scales, and take the arithmetical mean—that is, half the sum—of the apparent masses for the true mass. This is near enough to the truth when the apparent masses differ little from each other; but when it is otherwise, the Geometrical Mean (q.v.) must be taken, which gives the exact mass in all cases.

The third requisite—the sensitiveness—depends upon the weight of the beam, the position of its centre of gravity, and the length of its arms. Let ABD (fig. 1) represent the beam of a balance, C the point of suspension, G the centre of gravity, and ACB the straight line joining the knife-edges, which may be taken as the skeleton lever of the balance. We shall here confine our attention to that construction where the three knife-edges are in a line, because it is the most simple, and at the same time the most desirable. We may, without altering the principles of equilibrium, consider the

Fig. 1.

beam reduced to the lever AB, and embody its weight in a heavy point or small ball at the centre of gravity, G, connected with C by the rigid arm CG. The weights of the scales and contained equal masses act at A and B, and have no influence on the position of the beam since the arms are equal. If a small additional weight, p , therefore, act at B, the position of the beam is determined by its rotating tendency (moment) round C, and the counter-rotating tendency of the weight of the beam, W , acting at G. The question of sensitiveness is thus reduced to the action of the crooked lever GCB, with p acting at one end, and W at the other. The relations of the arms and forces of a crooked lever will be found under LEVER. It is only necessary here to state, that the moment of the weight acting at the end of a crooked lever, increases with its size, the length of its arm, and the smallness of the angle which that arm makes with the horizontal line passing through the fulcrum. Consequently, the longer the arms of a balance are, all other things being the same, the greater will be its sensitiveness. Also, the nearer the centre of gravity of the beam is to the point of support, the greater will be the sensitiveness of the balance; and, lastly, the smaller the weight of the beam, the greater will be the sensitiveness of the balance.

In the construction of the balance, it is a matter of importance to have the sensitiveness independent of

the weight of the scales and contained masses, so that when it is heavily loaded a small weight will produce the same inclination as when it is not loaded at all. This condition is implemented, as we have already shown, when the three knife-edges are kept in the same straight line. If the line joining the two terminal knife-edges lie below the point of suspension, then the centre of gravity of the equal masses will, upon the turning of the beam, be forced from below that point, and will accordingly have a tendency to resume its former position. The equal weights thus counteract to some extent the effect of the additional weight, and their influence in this way will be all the greater as they themselves increase.

When a balance is very sensitive, the beam keeps oscillating for a considerable time from one side to the other of the position in which it finally settles. The stability, or the tendency of the beam to come quickly to rest, depends on requirements nearly the opposite of those which conduce to sensitiveness. In the construction treated of above, the stability increases with the moment of the weight of the beam acting at G round C, so that it thus increases with the weight of the beam, and the distance of the centre of gravity from the point of suspension. The stability is also increased, as already shown, by having the line joining the scale knife-edges below the point of support.

Fig. 2 is the representation of one form of the delicate balances employed in physical and chemical

Fig. 2.

researches. The beam is constructed of aluminium, so as to combine lightness with strength, and rests by a fine agate knife-edge on an agate plane. The pans are also hung on agate knife-edges and planes. In the upper part of the beam is a small body moving on a screw, so that the sensitiveness may be increased or diminished according as the body is raised or depressed. In order that the knife-edges may not become blunted by constant contact with the supporting planes, a cross-bar, with projecting pins, is made to lift the beam from the plane, and the pans from the beam, and sustain their weights when the balance is not in play. The beam is divided by lines marked upon it into ten equal parts, and a small piece of fine wire bent into the form of a fork, called a rider, is made to slide along to any of the divisions. If the rider be, for instance, $\frac{1}{10}$ of a grain, and if, after the mass of a body is very nearly ascertained, it brings the beam, when placed at the first division next the centre, exactly to its horizontal position, an additional mass of $\frac{1}{10}$ of a grain will be indicated. As the beam takes some time before it comes to rest, it would be tedious to wait in each case till it did so, and for this reason a long pointed index is fixed to the beam below the point

of suspension, the lower extremity of which moves backward and forward on a graduated ivory scale, so that when the index moves to equal distances on either side of the zero point, we are quite certain, without waiting till it finally settles, that the beam will be horizontal. When great accuracy is required, a microscope or lens is used to read the oscillations. The balance is surrounded by an air-tight case to keep out dust, &c.; sliding doors giving access to the pans, and the little rider being manipulated from the outside. A small dish of strong sulphuric acid or dry carbonate of potash is kept inside to keep the atmosphere of the case dry. Even with the best mechanical skill, no balance can be made whose arms are absolutely equal; and to remedy this the method of 'double weighing' is resorted to, when the utmost accuracy is demanded. This consists in placing the body in one scale, and some substance in the other, until exact equilibrium is obtained, then removing the body, and putting in its place known masses (weights) which produce equilibrium again. The mass of the body must evidently be equal to the sum of the known masses.

The Roman balance, or *Steelyard* (Ger. *Schnellwage*), is more portable than the ordinary balance.

Fig. 3.

Its construction is indicated in fig. 3. AB is the beam, and C is the fulcrum. Taking the particular case indicated in the diagram, it is evident from the principles of the lever that the mass W is six times the mass P. As the steelyard is ordinarily made, the long arm is heavier than the short one, and therefore the graduation commences from a point between A and C, and not at C.

The *Bent Lever Balance* (Fr. *peson*, Ger. *Zeugerwage*), shown in fig. 4, is a lever of unequal arms AC, CB, moving round the pivot C, having a scale, Q, attached to the shorter arm AC, and a fixed mass, W, to the longer arm CB. The longer arm ends in a pointer moving in front of a fixed graduated arc. When a body is put into the scale, the pointer rises from the bottom or zero point of the arc, and rests opposite the mark corresponding to its weight. The higher the mass W rises, the greater becomes the moment of its weight, and the greater must be the mass whose weight it balances. The arc is generally graduated experimentally.

Fig. 4.

For other weighing apparatus, see **WEIGHING-MACHINES**; and for the law of unjust weighing, see **WEIGHTS AND MEASURES**.

Spring-balance.—The commonest form of the spring-balance, known as *Salter's Balance*, is shown in fig. 5. It consists of a spring in the form of a cylindrical coil in a metal case, which it about half fills when at rest. The upper end of the spring is fixed through the top of the case to a ring by which

it is suspended for use. To the lower end of the spring a rod is attached having an index-pointer working through a slot in the front plate of the case. The substance to be

Fig. 5.

weighed is fixed on a hook at the bottom end of the rod, and the weight as indicated by the stretching of the spring is read off on the scale (a part of the front plate has been removed in the figure, to show the spring inside). Another common form, called the Household Balance, is made to stand on a table, and has a dial-plate on which an index-finger registers the weight. The article to be weighed is put into a pan on the top of the balance. From the under side of the pan a rod goes down into the case; a cross bar at the bottom of this rod is attached to the lower ends of two coiled springs, the upper ends of which are fixed. A rack on the side of the rod, acting on a toothed wheel in conjunction with a system of levers, transfers the action of the rod under the weight in the pan to the index-finger, which registers the amount on the dial-plate. Spring-balances are also made in a great many other forms, and for various purposes, such as

letter balances, parcel balances, &c.; but the principle in all is the same—viz. the stretching of a spiral spring. They have no pretension to great accuracy, but are in extensive use for ordinary purposes, and have the advantages of being portable and having no weights to get lost. The spring-balance is also used as a Dynamometer (q.v.). It really measures weight directly, and therefore mass indirectly, since the two are proportional.

Balance of Power, that state of things in which no state is permitted to have such a preponderance as to endanger the independence of the others. The Greeks acted upon it more or less distinctly with regard to the relations of such states as Sparta, Athens, and Thebes. It was, however, more distinctly avowed as a motive of political conduct, and more systematically acted upon, after the time of Charles V. For nearly a century and a half the house of Hapsburg, of which Charles was the first great chief, seemed to strive at universal empire. The Thirty Years' War was waged not only to save Protestantism, and to prevent Austria from becoming master in Germany, but to hinder the predominance in Europe of a single crown. The motive of preserving the balance of power came most distinctly into the foreground in those unions which England, Holland, and Austria repeatedly formed against the menacing schemes of Louis XIV. for acquiring supreme power in Europe. It was the same cause that broke up the most dangerous (for Louis) of these coalitions; for in the war of the Spanish Succession, when the Hapsburg pretender to the Spanish throne became, by the death of Joseph I., sovereign of Austria and emperor of Germany, and the power which, in the hands of Charles V., had menaced the equilibrium of Europe, was thus likely to be again wielded by one man, England withdrew from the coalition, and thus saved Louis from a decided overthrow. The aggressive policy of Napoleon called all the nations of Europe to arms against him in the name of the balance of power; and in readjusting the map of Europe, the balance of power was often invoked to cover the jealousy which resisted not a few claims

to restitution of territory. For some time the balance of power in Europe was embodied in a pentarchy or virtual leadership of the five great powers, who mutually watched one another's movements. The formation of the kingdom of Italy increased the number of great powers to six. The rise of Germany since the war of 1870-71 gave it a leading place in maintaining the European balance. The great development of Russia, and the continuity of her aggressive policy in the East, formed a most important element in the European equilibrium. Since the doctrine of non-intervention has to a large extent gained ground, the idea of a balance of power has been less esteemed in Great Britain. There can be no doubt that the idea has prevailed chiefly since the rise of the great centralising states under absolute dynasties at the close of the feudal period, and that the true welfare of peoples has been again and again sacrificed to the balance of power and to dynastic interests therewith connected. Yet so far as the maintenance of the balance of power has tended to protect the independence of European states against great aggressors, and to prevent the predominance of a single despotic empire, it has been beneficial. Further, it may be pointed out that so long as Britain is an imperial state, she cannot altogether abstain from intervention in European politics, and from considering how the balance of power there affects her interests. On the whole, though the idea of a balance of power in its old form has fallen into disrepute, it may still be considered a working factor in politics. And the subject is greatly widened and complicated by the extension of European influence and European possessions all over the world. Problems in this connection (transformed by war and revolutions since 1914) have been the Eastern Question (q.v.), the rivalry of Russia and Britain in the East, the difficulties as to Egypt and the Suez Canal, the rise of Germany as a great power, and the entry of China and Japan into the circle of world-politics. See MONROE for the 'Monroe Doctrine.'

Balance of Trade is a term specially significant in the 'mercantile system' of political economy, which looked upon the possession of gold as the grand aim; so that it not unnaturally came to be a maxim that a nation becomes richer in proportion as the money-value of its exports exceeds that of its imports; the excess being paid in gold, was thought to be just so much added to the national wealth. Now, the difference between the money-value of the exports and imports of a state is called the 'balance of its trade;' and by the adherents of the mercantile system, this balance was said to be 'in favour' of the country or 'against' it, according as the exports or the imports showed the excess.

As a practical result of this theory, every sort of device was adopted in order to bring out a favourable balance. Laws were enacted prohibiting importation of foreign manufactures, or imposing high duties upon them, and giving premiums and other protective encouragements to exportation. The aim of commercial legislation, in short, was to promote the flow of the precious metals to one's own country, and to keep them there. The fallacies of the balance of trade were obviously due to a mistaken conception of the nature of wealth, and must therefore be traced to the errors of the Mercantile System (q.v.).

Connected with this, though very different, are the recent discussions regarding the balance of trade. For many years the imports of Great Britain have in value greatly exceeded the exports. Will not this tend eventually to the national impoverishment, especially as so large a proportion of

the imports is devoted to consumption as food and luxuries? With reference to this question, the following points should be considered: That a great proportion of the revenue of this country is drawn from investments abroad, and with these investments we can pay largely for our imports; also that an important part of our business with foreign countries consists in a carrying trade, from which we draw considerable profits. In point of fact, our national wealth is continually growing, though doubtless Britain has reached a stage when an increasingly large proportion of its wealth must be devoted to investment abroad, and a less proportion to productive work at home. In this question there is a special necessity for a criticism of statistics, figures being so misleading unless they are carefully scrutinised.

Balanoglossus, a genus of worm-like animals in the class Enteropneusta or Hemichorda, showing interesting affinities with Vertebrates. The genus and others closely related to it are represented by numerous species, with a wide distribution in almost all seas. Most of them are littoral animals, burrowing in the sand and mud. Several species occur around British coasts. They vary from 1 inch to a foot or more in length, are often brightly coloured, and have a repellent odour

Young *Balanoglossus*; showing proboscis, collar, gill-slits, and gastric region (from Claus).

sometimes like that of iodoform. The body has four regions—a pre-oral ‘proboscis,’ a ‘collar’ around and behind the mouth, a respiratory region with numerous pairs of dorsal gill-clefts (hence the name Enteropneust, ‘gut-breather’), and a posterior slightly coiled gastric region ending in the anus. The skin is ciliated and glandular, and the mucus it secretes tends to form sand-tubes. Although the proboscis and the collar become turgid in activity, the whole animal is very soft and breaks readily. There is great regenerative capacity. The permanently open mouth, on the ventral surface between the proboscis and the collar, has sand forced into it by the burrowing movements of the anterior portion of the body, and the food consists of the minute organisms and nutritive particles in the sand. The development is direct in a few species, indirect in most—i.e. with a larval form known as the Tornaria.

The affinities between *Balanoglossus* and Vertebrates are: (1) the gill-clefts; (2) the dorsal nerve-strand (but there is a ventral one as well); (3) a short somewhat ‘notochord-like’ rod which grows forward from the dorsal surface of the gut into the proboscis; and (4) the development of the Body-cavity (q.v.) from five pouches of the gut in a manner very suggestive of *Amphioxus* (q.v.). The last point seems also to indicate affinities with Echinoderms, to the larvæ of which the Tornaria larva of most species of Enteropneusts presents considerable resemblance. There are also indications of some distant relationship to Annelids, probably restricted to origin from a common stock. Nearly related to *Balanoglossus* are a number of

genera—e.g. *Dolichoglossus*, *Ptychodera*, *Schizocardium*, and *Spengelia*. Perhaps allied are two peculiar types, *Cephalodiscus* (q.v.) and *Rhabdopleura*.

See S. F. Harmer, ‘Hemichordata’ in *Cambridge Natural History*, vol. vi. (1904); Spengel’s great monograph in *Fauna und Flora des Golfs von Neapel* (1893); Bateson, *Quart. Journ. Micr. Sci.*, vol. xxv. (1885); Willey, *Zoological Results* (Cambridge, 1899).

Balanophoraceæ, a tropical order of dicotyledons, parasitic on tree-roots. A tuberous rhizome attached to the host-plant by suckers sends up (sometimes from within itself) a spike or head of small unisexual flowers and scaly leaves.

Balanus. See ACORN-SHELLS.

Balasinar (VADASINOR), a tributary state of Guzerat, Bombay (area, 189 sq. m.; pop. 40,563); chief town, Balasinar, 51 miles N. of Baroda (pop. 8157).

Balasor, a seaport and chief town of a district of Orissa, on the Buihabalang River, 15 miles from its mouth; pop. 21,362.

Balata, the inspissated juice of a sapotaceous tree, the *Mimusops balata* (see BULLET-TREE) of tropical America, which is used as a substitute for rubber and gutta-percha, being intermediate in quality between the two, and very suitable for belting, &c. The latex contains about equal proportions of resin and of a gum almost identical with that of gutta-percha.

Balaton, LAKE (Ger. *Platten-See*), the largest lake in Hungary, 55 miles SW. of Budapest. Lying 426 feet above sea-level, it is 48 miles long, and 10 broad, with an area of 245 sq. m.; depth from 20 to 150 feet. It is fed by upwards of thirty streams—the chief of which is the Szala—as well as by numerous springs which rise on its margin. Its outlet is by the Sio, which discharges itself into the Sarvitz, a feeder of the Danube. Its clear and transparent waters assume a bluish colour in storms. They have a slightly brackish taste. Fish of various kinds are abundant, including the *fogash*, a kind of large perch (10 to 20 pounds), found only in this lake.

Balayan, a seaport of Luzon, in the Philippines, at the NW. end of the Gulf of Balayan; pop. 27,000.

Balbi, ADRIANO, geographer and statistician, was born in Venice in 1782, and in 1808 was appointed lecturer on Geography at Murano, in 1811 on Physics at Fermo. A subsequent residence in Portugal led him to publish at Paris in 1822 a work of great value on the statistics of Portugal. Balbi lived in Paris till 1832; he then returned to Italy and settled at Padua, where he died 14th March 1848. His *Atlas Ethnographique du Globe* (Par. 1826) is distinguished by its extensive accumulation of facts and views, giving an account of German researches on the subject, and entering into questions of comparative philology. His best known work is the *Abrégé de Géographie* (1832). His *Scritti Geografici* were edited by his son, Eugenio (5 vols. Turin, 1841–42).

Balbi, GASPARO, a Venetian merchant of the 16th century, who is worthy of mention as the first traveller who has left an account of India beyond the Ganges. In the pursuit of his calling, Balbi was often led to Aleppo, and from thence, on one occasion, he made a visit to India which lasted several years. A Latin translation of his *Viaggio* (1590), or account of his travels, was printed at Frankfurt in 1594. In his journey he visited Bagdad, Basia, Goa, Cochin, and Pegu. He minutely records his own observations, but is excessively credulous in accepting information at second-hand.

Balbo, CESARE, COUNT, an Italian statesman and author, was born 21st November 1789 at Turin.

His father enjoyed the patronage of Napoleon; consequently the son served in various capacities under the empire, and afterwards as secretary of the Sardinian embassy at London. During the years 1821-43, he produced several works of a politico-historical nature. His *Speranze d'Italia* ('Hopes of Italy'), published in 1843, gave a vivid and intelligent picture of the political condition of Italy. It did not aim, however, at Italian unity, but rather suggested a confederacy of independent states, under the supremacy of the pope. Balbo's adherence to the Roman Catholic Church is strongly marked in all his works. He took a prominent part as a moderate Liberal in the political movements of 1847-48. He died 3d June 1853. See *Lives* by Ricotti (1856) and Reuchlin (1860).

Balboa, VASCO NUÑEZ DE, a Spanish conqueror, was born of a noble but reduced family at Xeres-de-los-Caballeros in 1475. After rather a dissolute youth, he gladly took part in the great mercantile expedition westward ho! of Rodrigo de Bastidas. He established himself in San Domingo, and began to cultivate the soil; but fortune proving adverse, in order to escape from his creditors, he had himself smuggled on board a ship, and joined the expedition to Darien in 1510, commanded by Francisco de Enciso. An insurrection which took place obtained for Balboa the supreme command in the new colony. Confused accounts which reached him of a great western ocean impelled him to set out in quest of it. On the 25th of September 1513 he obtained the first sight of the Pacific Ocean by a European from 'a peak in Darien.' The governorship of the territories conquered by Balboa was obtained in 1514 by Pedrarias Davila, by means of his intrigues at the Spanish court. Balboa won over the Indians by his kindness, visited the Pearl Islands, and gave promise of further successes; but through Davila's enmity he was accused of a design to rebel, and, in violation of all forms of justice, was beheaded at Acla in 1517. In Panamá (whose monetary unit, the gold *Balboa*, equals a U.S.A. gold dollar) the Quatercentenary of Balboa's discovery of the Pacific was celebrated, together with the opening of the Panamá Canal, by a National Exposition (1914).

Balbriggan, a watering-place in Dublin county, 21 miles N. by E. of Dublin, sacked in 1920 by men in uniform. It is a seat of linen, cotton, calico, and stocking manufactures. Its cotton stockings are remarkable for fineness of texture and beauty of open work. Many women are employed in embroidering muslin. Pop. 5000.

Balcony (till about 1825 BALCO'NY; Ital. *balcone*), a projecting gallery in front of a window or of several windows, with a balustrade or parapet at its outer edge, and supported by consoles, or brackets fixed in the wall, or by pillars resting on the ground below. The balcony was unknown in Greek and Roman architecture, the earliest examples of it occurring in Italy, to the climate of which country it is peculiarly adapted.

Bal'dachin (Ital. *baldacchino*), a canopy of the form of a tent or umbrella, made of costly materials and richly adorned, which is either supported on pillars, or fastened to the roof over a throne or couch, or over a pulpit, an altar, or other sacred object. One of the most celebrated is the baldachin in the church of St Peter's in Rome, cast in bronze by Bernini, which is supported on four large twisted columns. From the days of Constantine, altars were often overshadowed by canopies called *ciboria*, from their resemblance to the bowl of a cup; and the sacrament was placed in a vessel suspended by a cord from the interior of this cupola. The proposal to erect a baldachin in

St Barnabas Church, Pimlico, gave rise to litigation, which ended in a decision (15th December 1873) against the legality of such a structure in an Anglican church. Baldachin is also the name given to a kind of umbrella of a square form, supported on four poles, borne over the priest who carries the Host. The name, as well as the thing itself, comes from the East, where a baldachin was borne as a symbol of their rank over the heads of the great. Such canopies were often sent as presents from eastern princes to those in the West; as, for example, from the Calif Haroun-al-Raschid to Charlemagne. During the Crusades, and the consequent trade with the East, they became well known to the Italians, and baldachin is merely a corruption of Baaldak, the name by which Bagdad was then known to Europe.

Balder, or BALDUR, the hero of one of the most beautiful and interesting myths in the Edda, was, according to northern mythology, son of Odin and Frigga, and the husband of Nanna. Having dreamed evil dreams which threatened his life, he related them to the gods, whereupon they held a council, and endeavoured to secure his safety. Frigga took an oath from everything in nature, animate and inanimate alike, that it would not harm Balder, but she forgot the mistletoe. The gods, thinking Balder safe, in their mirth wrestled with him, and cast darts and stones at him. The malicious Loki alone took no part in the play, but changing himself into the form of an old woman, found out from Frigga that the reason for Balder's invulnerability was that everything but the little mistletoe had sworn not to harm him. Loki went in haste to fetch a bough, and repaired with it to the assembly of the gods, where he placed it in the hands of the blind Hoder, the god of war, and directed his aim against Balder, who fell pierced to the heart. The sorrow of the gods was unutterable. Hermoder (the nimble) at once started on his journey to ask Hel, the goddess of Hades or the grave, to release Balder. She at once consented, on condition that all things should weep for Balder. All things wept, save the witch or giantess Thökk (the step-daughter of Loki), and so Balder must remain in the kingdom of Hel until the end of the world. At his funeral the pyre was placed on board his ship in presence of the frost-giants.

Balder is the best and wisest of the Æsir. His death is the great turning-point of the drama, as it proves the mortal nature of the gods. The powers of evil could not prevail as long as he lived, but his death is the doom of all the Æsir. Loki and his brood of wicked monsters are at first subdued, but at last they burst their bonds, and the great catastrophe of Ragnarök ensues. After long winter and war between the gods and the collected frost-giants, the forces of cold, fire, and darkness, in which both adversaries perish, comes the complete renovation of the world, in which the chief of the Æsir are hallowed and purified, and Balder returns from the under-world to inaugurate a reign of happiness and peace. It is probable that in the story of Balder there is an admixture of physical and moral allegory. Originally a nature-myth, it underwent a transformation through the addition of ethical conceptions, but the same early form continued to express the later religious ideas.

See SCANDINAVIAN MYTHOLOGY and books there named; Grimm's *Deutsche Mythologie*; Frazer's *Golden Bough*; and Sydney Dobell's poem, *Balder the Beautiful*.

Baldmoney is a popular name for several kinds of Gentian (q.v.), also for an umbelliferous plant (*Meum athamanticum*) used as a carminative medicine.

Baldness (Gr. *alopecia*, 'fox-mange'). See **HAIR**. *Congenital baldness* (complete absence of hair at birth) is sometimes met with; but in most cases is only temporary, and gives place in a few years to a natural growth of hair. Occasionally, however, it persists through life.

Senile baldness (calvities) is one of the most familiar signs of old age. It commences in a small area at the crown, where the natural hair is first replaced by down before the skin becomes smooth and shining. From this area the process extends in all directions. It is more common in men than women. A precisely similar condition occurs not unfrequently at an earlier age (presenile baldness). It is generally due to hereditary tendency: but is favoured by keeping the head closely covered, especially with a tight-fitting cap or hat. The best authorities agree that this form of baldness is incurable.

There is a condition, however, which in its later stages much resembles the last, but is more amenable to treatment. Here the loss of hair begins simultaneously at the crown, and near the margin of the hair on the forehead. Its chief characteristic, however, is that it is preceded for some years by extreme scurfiness of the scalp. During this stage the process can be checked—sometimes, indeed, even after loss of hair has begun. The most successful treatment consists in thorough rubbing of the scalp with an ointment containing 10 per cent. of precipitated sulphur, or with Lassar's paste containing 10 grains of salicylic acid to an ounce of vaseline, at first nightly, then, as the scurf diminishes, at gradually longer intervals.

Great loss of hair frequently follows severe illnesses or other causes which produce general debility. As health returns, the hair usually returns with it; its growth may be promoted by the use of lotions containing cantharides, ammonia, or some other stimulating agent. Baths containing common salt, and brisk rubbing, are also useful.

Baldness in patches (*alopecia areata*) attacks chiefly children and young persons, frequently those of debilitated constitutions. The only change at first perceptible is that the hair falls out in one or more places, leaving smooth bare patches. These may gradually extend, and with the progress of the disease the affected skin becomes somewhat thinned. It is liable to be mistaken for Ringworm (q.v.). *Alopecia areata* has been attributed to the action of a parasite; but it is more probably due to some obscure nervous influence. Mild cases almost always recover; and even in the worst forms complete restoration of the hair may take place, sometimes after many years of baldness. The treatment consists in stimulation of the skin, blistering, salt baths, the use of electricity, &c. In all forms, attention must be paid to the general as well as the local treatment. A liberal diet and the use of iron and other tonics are frequently of the greatest service.

Baldric is a belt or sash worn partly as a military and partly as a heraldic symbol. It goes round the waist as a girdle, or passes over the left shoulder, and is brought down obliquely under the right arm, or is suspended from the right shoulder in such a way as to sustain a sword. Many of the effigies of knights show the baldric, more frequently as a belt than a shoulder-sash.

Baldung, HANS, called also Hans Grün, a German painter and engraver, contemporary with Albert Dürer, to whom, in expression, colouring, and finish, he was little inferior. He was born at Gmünd, in Swabia, about 1476, and died at Strasburg in 1545. His masterpiece, a painting of the Crucifixion, is in the cathedral of Freiburg; his wood-engravings are numerous.

Baldwin I., king of Jerusalem, 1100–18, was

born in 1058. He was the youngest brother of Godfrey (q.v.) of Bouillon, with whom he took part in the first Crusade; but having quarrelled with Tancred, he retired to Edessa, of which he was soon after elected prince. After the death of his brother Godfrey, in 1100, he became Protector of the Holy Sepulchre, and Baron of Jerusalem, and immediately assumed the regal title, which his brother had refused. He conquered Cæsarea, Ashdod, and Tripolis, and, with the assistance of a Genoese fleet, made himself master also of Acre, and subsequently of Sidon, but failed to reduce Ascalon. He died in 1118.—**BALDWIN II.**, cousin and successor of Baldwin I., reigned from 1118–31. During his reign Tyre was taken, and the order of the Templars was instituted. He died in 1131, having resigned the crown in favour of his son-in-law, Foulques of Anjou, who reigned till 1134.—**BALDWIN III.**, king of Jerusalem, 1143–62, the son and successor of Foulques of Anjou, was born in 1129. He was regarded as a model of knight-hood, and his authority and influence were great. He died in 1162, and with his death the Christian power in the East began to decline. He was succeeded in the government by his brother Amalric, who died in 1173.—**BALDWIN IV.**, the son and successor of Amalric, surnamed the Leper, reigned till 1184, when he caused **BALDWIN V.**, a child of six years old, the son of his sister Sybilla, to be crowned. The child died in 1186.

Baldwin I., the first Latin emperor of Constantinople, was born at Valenciennes in 1171 A.D., and succeeded his parents as Count of Hainault and Flanders in 1195. In 1200 he joined the fourth Crusade, and assisted in the recapture of Constantinople for the Emperor Isaac II. As the latter failed in his payments, the Crusaders turned their arms against him, and sacked the town. Alexis having been murdered in a rising of the citizens, Baldwin was chosen emperor, and crowned in 1204. The Greeks, invoking the aid of the Bulgarians, rose and took Adrianople. Baldwin laid siege to the town; but, defeated and taken prisoner by the Bulgarian king, he died about a year after (1206) in captivity.

Baldwin II. (1217–73), nephew of Baldwin I., succeeded to the throne as a boy in 1228, but was never able to hold his own with Greeks and Bulgarians. His capital was taken in 1261 by the Greeks. He fled to Italy, and with him fell the Latin empire of Constantinople. See BYZANTINE EMPIRE.

Baldwin, ROBERT (1804–58), born in Toronto, was called to the bar, held office under Sir Edward Head, in 1840 became Solicitor-general for Upper Canada, in 1842–43 was Premier, and in 1848–51 was Attorney-general for Upper Canada. As founder of the 'Reform' party, he is reckoned one of the 'makers of Canada.' See book by Ross (1906).

Baldwin, STANLEY, born in 1867, and educated at Harrow and Trinity College, Cambridge, turned in 1908 from a successful career in business to parliament. In 1917 he was appointed Financial Secretary to the Treasury. In 1922 he had a main hand in breaking the Coalition, and became Chancellor of the Exchequer. On Mr Law's resignation in 1923 he became Prime Minister. In December he appealed to the country for a mandate to introduce Protection, but was defeated. He acted as chief of the opposition and leader of the Unionist Party during the Labour administration. His second term of office (from 1924) was disturbed by the coal dispute of 1926 and other perplexities.

Bale. See BASEL.

Bale, JOHN, Bishop of Ossory, was born at Cove, near Dunwich, in 1495. From a Carmelite monastery at Norwich he passed to Jesus College,

Cambridge, and obtained a living, though already a Protestant. In 1540 he had to flee to Germany, whence, in 1547, he was recalled by Edward VI., who two years later made him Bishop of Ossory in Leinster. Here 'Bilious Bale' made himself so obnoxious to the Catholics that, on news of the death of Edward, his house was attacked and his effects destroyed, and he himself escaped to Holland with great difficulty. On the accession of Elizabeth he was made a prebendary of Canterbury. He died in 1563. His fame rests partly on a Latin history of English literature (1548), which is a valuable work, though sections of a book are often set down in it as distinct works, and persons who never wrote anything are given as authors. He occupies an important place in the history of the drama. His plays are sorry doggerel; yet his *King Johan* (Camden Society, 1838) is a link between such moralities as his own *Breve Comedy of Johan Baptyste* and the masterpieces of the Elizabethan stage. The Parker Society published his select works (1849).

Balearic Isles, a group—Majorca (q.v.), Minorca (q.v.), Ibiza (q.v.), with Formentera, Cabrera, and several smaller islets—lying off the coast of Valencia. They form a province of Spain (q.v.), having been successively Carthaginian, Roman, independent (1220–1344), and a dependency of Aragon (from 1349). The *Balears* were famous slingers; and their name was derived by the ancients from the Greek *ballein*, 'to throw.'

Baleen, a name for whalebone. See **WHALE**.

Bale-fire. See **BEACON**.

Balfe, MICHAEL WILLIAM, composer, was born in Dublin, 15th May 1808. His musical talent received early culture, and in his ninth year he made his début as a violinist, having begun to compose at least two years earlier. In 1823 he came to London, and during 1825–26 studied in Italy under Paer, Galli, Federici, and Rossini. In 1826 he wrote the music for a ballet, *La Pérouse*, performed at Milan; and in 1827 he sang in the Italian Opera at Paris with great applause, his voice being a pure rich baritone. In 1833 he returned to England, and in 1846 was appointed conductor of the London Italian Opera. He died at Rowley Abbey, his estate in Hertfordshire, 20th October 1870. Of his numerous operas, operettas, and other compositions, produced in rapid succession from 1830, the most permanently successful have been *The Bohemian Girl* (1843), *The Rose of Castile* (1857), and *Il Talismano* (1874). If Balfe was wanting in depth and dramatic force, he had a very thorough knowledge of effect and command of orchestral resources; his compositions show much fluency and melodic power; and many of his songs are admirable. See works on him by Kenney (1875) and Barrett (1882).

Balfour, ARTHUR JAMES, EARL OF BALFOUR (1922), K.G., was at the beginning of the 20th century by far the foremost of British Conservative leaders, distinguished for sagacity, caution, and debating power, a philosophical thinker of eminence, and a man of exceptional culture in music and otherwise. Born 25th July 1848, in 1856 he succeeded his father in the estate of Whittinghame, Haddingtonshire. Educated at Eton and Trinity College, Cambridge, he entered parliament in 1874 as Conservative member for Hertford, and from 1878 to 1880 was private secretary to his uncle, Lord Salisbury, whom he accompanied to the Berlin Congress. For a while an unattached member of Lord Randolph Churchill's 'Fourth Party,' he led off the attack on the 'Kilmainham Treaty' (1882), negotiated with Lord Hartington the franchise compromise (1884), was returned for East Manchester (1885), and was appointed president of the local government board (1885), secretary for Scot-

land (1886), and chief-secretary for Ireland (1887). In this perilous post, the grave of so many reputations, the 'dilettante philosopher' soon surprised the country, but especially the Irish members, by the energy with which he set himself to administer the laws and enforce discipline without fear and without favour, and apparently wholly undisturbed by invective or calumny: before the five years he held the office were out, 'bloody Balfour' was even more respected than he was hated or feared. He became First Lord of the Treasury and leader of the House of Commons in 1892, 1895, and 1900; as prime-minister in 1902–5 he accepted—not very heartily, as was thought—a policy of tariff reform (see **CHAMBERLAIN**), including retaliatory tariffs. The Education Bill of 1902 was bitterly opposed by the Nonconformists, and a licensing bill failed to conciliate reformers. As leader in opposition of the Unionist party from 1906, he displayed even more brilliantly than in office many of the higher gifts of a great parliamentarian, was the 'Rupert of debate' in his time, and during the struggles on the Lloyd George Budget and the Parliament Bill succeeded in maintaining the cohesion of both wings of the party—not without dissidence on the part of the 'forwards,' who demanded a more active and aggressive policy. Feeling the increasing strain on his physical powers, he resigned the leadership of the party before the introduction of the threatened Home Rule Bill and the manhood suffrage bill. His temperament, somewhat critical, speculative, and sceptical, led him to disdain some of the minor acts of the politician. In the Coalition ministries he was successively First Lord of the Admiralty, Foreign Secretary, and Lord President of the Council. He attended the Peace Conference and the Washington Conference (1921–22). He wrote *A Defence of Philosophic Doubt* (1879; 2d ed. 1894), *Essays and Addresses* (1893), *The Foundations of Belief* (1895), *Theism and Humanism* (1915), *Essays Speculative and Political* (1920), *Theism and Thought* (1923).—His brother, FRANCIS MATTLAND BALFOUR, embryologist, was born at Edinburgh in 1851, and educated at Harrow and Trinity College, Cambridge. His researches on the development of the elasmobranch fishes threw new light on many problems of vertebrate morphology, and he took a leading part in the work of founding the Cambridge school of natural science. In 1878–83 appeared his well-known *Comparative Embryology*. Besides receiving many scientific distinctions, and declining tempting offers from Oxford and Edinburgh, he was appointed to a special chair of Animal Morphology in 1882. But on the 19th July of that year he lost his life while attempting to climb one of the spurs of Mont Blanc.—Another brother, GERALD, born 1853, from Eton passed to Trinity College, Cambridge. Conservative M.P. for Central Leeds (1885–1906), in 1895 he became Chief-secretary for Ireland, and in 1900–5 was President of the Board of Trade, and in 1905–6 of the Local Government Board.—For their sister, see **SIDGWICK (HENRY)**.

Balfour, SIR JAMES, Lord President of the Court of Session, was a son of Sir Michael Balfour of Montquhanie, Fife. In early life he was implicated in the plot against Cardinal Beaton, and on the surrender of the castle of St Andrews (1547) he was carried prisoner to France with John Knox. Two years later he purchased freedom by apostasy, and returning to Scotland, entered on that infamous career in which he 'served with all parties, deserted all, and yet profited by all.' When Morton was made regent, Balfour received a commission to make a general digest of the law. It is doubtful, however, how far the *Practicks of Scots Law* that bears his name is really his; for, not feeling him-

self safe in Scotland, he left it for France, where he remained seven years (1573-80). He died in 1583.

Balfour, JOHN, of Kinloch, or of Burley in Scott's *Old Mortality*, was one of the chief actors in the assassination of Archbishop Sharp in 1679, for which his estate was forfeited, and a pice set on his head. He fought at Drumclog and Bothwell Bridge, and is said afterwards to have escaped to Holland. By one account he died on a homeward voyage to Scotland; by another he never left the country, but settled in the parish of Rosneath, Dumbartonshire. Balfour of Kinloch is not to be confused with Lord Balfour of Burleigh. Contemporary with him were the second Lord Balfour of Burleigh, who was a privy councillor in 1641, and the third lord, who succeeded in 1663 (see below).

Balfour, JOHN HUTTON (1808-84), born in Edinburgh, studied medicine at the university there, and after being for four years professor of Botany at Glasgow, held the botany chair at Edinburgh University from 1845. He wrote manuals and class-books of botany.

Balfour of Burleigh (ALEXANDER HUGH BRUCE), the sixth lord, was born 13th January 1849, from Eton passed to Oriel College, Oxford, and in 1869 had the peerage restored to him, which had been in abeyance since the '15. In 1889-92 he was parliamentary secretary to the Board of Trade, and in 1895-1903 he was Secretary for Scotland, retiring as a Free Trader. Chairman of many important commissions, including those on food-supply in time of war, and on closer relations between Canada and the West Indies, he was a strenuous opponent of the disestablishment of the Church of Scotland. He died 6th July 1921.

Balfursh' (or more correctly BARFURUSH, 'mart of burdens'), a town in the Persian province of Mazanderan, on the river Bhawal, 14 miles from its mouth in the Caspian Sea. The river is not navigated, all goods being landed at the port of Meshed-i-Ser, on the Caspian. Balfursh is a centre of trade between Russia and Persia, exporting large quantities of silk, rice, and cotton, while the Russians supply iron and naphtha. It has excellent bazaars, numerous caravanserais, and several Mohammedan colleges. The population is stated at 50,000.

Bali, or LITTLE JAVA, one of the Sunda Islands, lying east of Java, about 75 miles long by 50 broad. Its area is 2300 sq. m.; pop. 960,000. A chain of mountains crosses the island from east to west, rising in the volcanic peak of Gunung-agung to 12,379 feet. Agriculture is the chief employment of the people. They grow rice, indigo, cotton, fruits, maize, and edible roots, and possess buffaloes and cattle. Fish are plentiful. Coffee is now exported in considerable quantity from Buleleng, the trading capital. The Balinese are a superior race, and speak a language related to Javanese. They excel as sculptors, and in working gold, silver, and iron. Their religion is Brahmanism of an ancient type, and they still keep up some rites which have disappeared from India. Under the Dutch, the nine little principalities of the island are governed by native rulers. Chinese and a few Europeans are the chief traders. For ritual see *Folklore*, xxxiv. 3 (1923).

Balliol, an Anglo-Norman family that played a prominent part in Scottish history. Its founder, Guido or Guy, held Bailleul, Harcourt, and other fiefs in Normandy, and from Rufus, whose father he had followed to England, received broad possessions in Durham and Northumberland. Bernard, his son, built the fortress of Barnard Castle; his great-grandson, John, founded Balliol College, Oxford (by way of penance), died in 1269, and was

survived till 1290 by his widow, Devorguila, the daughter and co-heiress of Alan, Lord of Galloway, and the great-great-granddaughter of David I.—Their son, JOHN DE BALIOL, born in 1249, succeeded in her right to the lordship of Galloway, as well as to his father's vast possessions in England and Normandy. On the death of the Maid of Norway in 1290, he became a competitor for the crown of Scotland, and his claim was pronounced superior to that of the other principal competitor, Robert Bruce, Lord of Annandale. The arbiter was Edward I. of England, who found this a fit opportunity for asserting his claim as lord-paramount of Scotland. That claim was acknowledged by the Scottish Estates in submitting the contest to his decision; and, consistently with this ignominious submission, Baliol, before and after his coronation at Scone (1292), swore fealty to Edward as his feudal superior. He was soon made to feel that his sovereignty was merely nominal, and, abject as he had shown himself, the indignities which he experienced at length roused him to an assertion of his rights as king. In 1295 he took upon him, by the advice of his nobles, to conclude an alliance with France, then at war with England. This act of revolt was followed by speedy chastisement. Edward invaded Scotland with a large force; defeated the Scottish troops; took Baliol prisoner, and compelled him formally to surrender his crown, July 7, 1296. Baliol was confined for three years at Hertford and in the Tower, enjoying, however, a limited freedom and something of royal state. In 1302 he was permitted to retire to his estates in Normandy, where he died in 1315, the year after Bannockburn. The estimate by his subjects of this poor-spirited prince was significantly indicated by the nickname of 'Toom Tabard,' or Empty Jacket.—EDWARD, his son, in 1332 made himself momentarily conspicuous in history by his daring and successful invasion of Scotland. Accompanied by the 'disinherited barons,' who were bent on recovering their forfeited Scottish estates, he landed with 3400 followers at Kinghorn in Fife; defeated the Earl of Fife; pushed boldly into the country; and at Dupplin Moor in Perthshire, on the night of 12th August, surprised and routed 30,000 men under the new regent Mar, who himself was slain, with 13,000 besides. On 24th September, seven weeks from the date of his landing, he was crowned king of Scotland at Scone. He had not enjoyed the kingly dignity for full three months, when he was surprised in his camp at Annan by Archibald Douglas, and nearly lost his life as well as the crown he had so recently assumed. His subsequent career is the very reverse of what might have been anticipated from so adventurous a beginning, being marked only by weakness, servility, and misfortune. He died near Doncaster in 1367, and with him ended the house of Baliol.

Balista. See BALLISTA.

Balistés, or FILE-FISH, a genus of bony fishes of the order Plectognathi of Cuvier; the type of a large family, Balistidae, the species of which are almost all inhabitants of tropical and subtropical seas, frequenting rocky coasts and coral-reefs. One species has been occasionally found on British coasts. Their colours are generally brilliant. The skeleton, as in the other Plectognathi, is in part gristly or cartilaginous, and the external covering of the body often resembles that of the Ganoid (q.v.) fishes, consisting, in some of the genera, of bony plates, disposed in regular rows, and not overlapping; in others, of very small rough scales, with stiff bristles, as densely crowded as the pile of velvet. The snout protrudes slightly, and the teeth are few, but well developed. But the most interesting thing in connection with these

fishes, is the provision for fixing the first dorsal spine in an erect position, or lowering it at the will of the animal. The spine is articulated by ring and bolt to a broad bony plate in connection with the backbone. 'When the spine is raised, a depression at the back part of its base receives a corresponding projection from the contiguous base of the second ray, which fixes it like the hammer of a gun-lock at full cock, and

Balistes conspicillum.

it cannot be let down until the small spine has been depressed, as by pulling the trigger; it is then received into a groove on the supporting plate, and offers no impediment to the progress of the fish through the water. This trigger-like fixing of the spine takes place also in the dead fish; and when a *Balistes* is removed from the bottle for examination, it is generally necessary to release the spine by pressing on the small trigger-ray.' The fish is called at Rome *pesce balestra*, in reference to the resemblance between the principle of the above mechanism and that of the Roman dart-throwing engine, *ballesta*. The first spine is roughened with enamel projections, whence the name File-fish. The flesh is unwholesome.

Balizes. See BELIZE.

Balkan Peninsula is a usual name for the peninsula in South-eastern Europe running southwards between the Adriatic and the Ægean. The most convenient northern boundary is the Save and the Lower Danube; though historically and politically Rumania and the more northerly parts of Yugoslavia are closely associated with the regions south of that boundary. Greece is a peninsula upon a peninsula, and has not always been accounted one of the Balkan States. In a general way the Balkan Peninsula and Balkan States cover the area of Turkey in Europe and the non-Turkish states which were in modern times under Turkish suzerainty, with the exception of Rumania. By its physical relief and general slope, the peninsula may be said to turn its back upon Europe. Its greatest elevations are found in the west and north-west, and all its waters, flowing north, east, and south, finally empty into the Black Sea or into the Ægean. The mountain chains and masses of the peninsula in no place form a regular system; spreading out from an apparent nucleus in the Etropol Balkans south-east of Sofia, in every direction, they are notable for their great variety of shape and richness of contour. The Balkans proper (ancient *Hæmus*) formed the boundary between Bulgaria and Eastern Roumelia. They are highest in the west, where the mean height is 6500 feet. The ridge is crossed by some 30 passes, of which the Shipka, between Kezanlik and Tirnova, and 4290 feet high, is the most noted in history—especially as the scene of severe fighting in the Russo-Turkish war of 1877-78. The mountain-chains in the west of the peninsula have a trend parallel to the shores of the Adriatic and

Ionian seas, whilst in the east, the chief ranges run at right angles to the Black Sea. The small though well-defined chain of the Rhodope (Despoto-Dagh) has a mean elevation of 5500 feet, and forms the water-parting between the Maritza Valley on the north and the Ægean on the south. Muss-alla (9500 feet), in the northern extremity of this range, is the culminating point of the northern portion of the peninsula, but the highest peak is Mount Olympus (9750 feet), north-east of the plain of Thessaly. There are several other ranges—the Dinaric Alps in the north-west, Pindus, between Albania and Thessaly, and the Little Balkans in Bulgaria, running north-east from the main chain; and peaks of from 5000 to 9000 feet occur in nearly every part of the peninsula.

The first place in the hydrographic systems of the peninsula must of course be given to the Danube. The Sea of Marmora receives only a few mountain-torrents, but the drainage area of the Ægean, or Archipelago, comprises the most important purely Balkan river-system. The chief rivers—the Maritza, the Kara Su, the Vardar, the Indje—flow from the southern slopes of the Balkans and the crystalline masses of the Rhodope system. Lake Scutari and Lake Ochrida (the latter 2300 feet above sea-level) are the only ones of any size in the peninsula.

Ethnography.—The great highway of western emigration, the Balkan Peninsula still retains a great diversity of races. The oldest inhabitants of the peninsula—the Illyrians—have their representatives in the modern Albanians (Skipetar); the Greeks are there, and have kept their language; the Dacians, who adopted the Roman tongue, are the Rumans or Rumanians of to-day. The Slavonic peoples are, of course, a large and important section of the population. Of the Thracian settlers, the Bulgars have become a thoroughly Slavonised people; and the Ottoman Turks, who first gained a footing in 1355, conquered nearly the whole of the peninsula before the close of the century, reduced Greece to subjection between 1455 and 1473, and remained masters to the 19th century.

According to Reclus, the peninsula and its islands may be divided into four ethnological zones: (1) Crete and the islands of the Archipelago, the seaboard of the Ægean, the eastern slope of Pindus and of Olympus, are peopled by Greeks; (2) the space comprised between the Adriatic and Pindus is the country of the Albanians (Skipetar); (3) on the NW. the region of the Illyrian Alps is occupied by Southern Slavs, known under the names of Serbs, Croats, Bosnians, Herzegovinians, and Chernagorians (Montenegrins); and (4) the two slopes of the Balkans proper, the Despoto-Dagh, and the plains belong to the Bulgarians. The Turks are scattered here and there in more or less considerable groups, chiefly round the cities and strongholds; but the only extensive tract of country of which they are, ethnologically speaking, the possessors is the south-eastern angle of the peninsula. As to the relative numbers of these varied elements, there is considerable diversity of statement—each stock trying to prove its ethnical predominance in debatable ground. At the beginning of the 20th century it was reckoned that in European Turkey there were 1,362,000 Turks—not pure Osmanli, but largely descended from renegade Greeks and Bulgarians; 1,137,000 Greeks; 1,011,000 Albanians, of whom 723,000 are Mohammedans; 200,000 Wallachians; 1,388,000 Serbs; 2,877,000 Bulgarians, of whom 860,000 are Mohammedans; 100,000 Armenians; 70,000 Jews; 104,000 Gipsies; and 144,000 Circassian immigrants.

The home of so many diverse races, the peninsula has long been a hotbed of warring interests, intertribal jealousy and intrigue, political tyranny and

disturbance, and mutual maltreatment. The Turk's hand may summarily be said to have been against every man's hand, and every other against the Turk. Greeks and Bulgarians intrigued each against the other with Russia and elsewhere, and look on the inheritance of the peninsula as exclusively theirs by right. Bulgarian and Serb, though cherishing the Slavonic name, met in the bloody campaigns of 1885-86, 1913, 1915-18. Macedonia in especial is demanded alike by Greek, Bulgar, and Serb. And the case is further complicated by the hostile faiths—Latin Christianity, Greek Church both Orthodox and United, and Mohammedanism. Hence it is easy to infer the last degree of unstable equilibrium in the political sphere, and to understand why the peninsula is a perpetual focus of the insoluble 'Eastern Question,' and a cause of disquietude to all the powers of Europe. Russia has warred with Turkey; Austria and Russia have had diametrically opposed interests as regards the Lower Danube, and in the Dual Monarchy Hungarian and Slav took opposite sides as to the Southern Slavs; France, Britain, and Germany have by no means always been able to see eye to eye at the Porte; Italy has her own special interests beyond the Adriatic; and the new constitution of Turkey (1909) did not succeed in conciliating the Albanians, or allaying the secular rivalry between Greeks and Bulgarians in Macedonia.

Greece obtained her independence in 1836, as also did Serbia in 1830-67. Wallachia and Moldavia (from 1859 as Rumania) were made tributary principalities 1856. Rumania and Serbia obtained their complete independence by the Berlin Treaty of 1878, which also handed over to Austria-Hungary the administration of Bosnia and Herzegovina, and established the principalities of Montenegro and Bulgaria, and the self-governing province of Eastern Roumelia. Rumania became a kingdom in 1881, Serbia in 1882, Montenegro in 1910. In 1885 Roumelia declared for union with Bulgaria, which in 1908, at the time of the revolution in Turkey, declared its independence and took rank as a kingdom. In 1908 also Austria formally annexed Bosnia and Herzegovina, assigning them a constitution. Momentarily suspending their mutual animosities, the Greeks, Southern Slavs, and Bulgars made war upon Turkey in 1912, and might have driven her out of Europe had not each aimed at gaining more than their share of the spoils. The net result of the war and the second war (1913) that grew out of it was that Albania was made independent; Greece, Serbia, and Montenegro doubled; Bulgaria considerably increased at Turkey's expense, and Rumania at Bulgaria's. After the great European war, Serbia, Montenegro, and the Southern Slav regions of the dual monarchy were united as Yugoslavia, Bulgaria curtailed, Turkey all but eliminated, and Greece greatly extended.

See TURKEY, GRECE, BULGARIA, SERBIA, &c., and books there cited; EASTERN QUESTION; SLAVS; books on the Balkan countries by Laveleye (1887), Miller (1896 and 1899), Wyon (1904), Fraser (1906), Herbert (1906), Booth (1906), Villari (1906), Miss Durham (1906), Crawford (1915), and Seton-Watson (1917); and Brailsford's *Macedonia* (1906).

Balkh, a district of Afghan Turkestan, the most northerly province of Afghanistan. It corresponds to ancient Bactria, and lies between 35° and 37° N. lat., and 64° and 69° E. long. It is bounded on the N. by the river Oxus, on the E. by Badakhshan, on the S. by the Hindu-Kush, and on the W. by the desert. Offsets of the Hindu-Kush traverse it in a NW. direction, and slope down to the low steppes of Bokhara. Its length is 250 miles; its breadth, 120. Its situation was once important during the overland commerce between India and Eastern Europe before the sea-

route by the Cape of Good Hope was followed. The soil has the general characteristics of a desert land; only a few parts are made fertile by artificial irrigation; and such are the vicissitudes of climate, that where grapes and apricots ripen in summer, and the mulberry-tree permits the cultivation of silk, in winter the frost is intense, and the snow lies deep on the ground. The natives are Uzbeqs (q.v.), whose character differs in different districts.

BALKH, long the chief town, situated in a district intersected by canals and ditches, by means of which the waters of the Balkh-ab, or Dehās, are dissipated and prevented from flowing towards the Amu-Daria, only 45 miles distant. It is surrounded by a mud wall; but though bearing the imposing title of 'mother of cities,' it has not in recent times had any of the grandeur of ancient Bactra, on the site of which it is built. It was twice destroyed by Genghis Khan and Timur. A terrible outbreak of cholera in 1877 caused the capital of Afghan Turkestan to be transferred to Mazar, west of Balkh; since which Balkh has been an insignificant village. West of Balkh are the petty Uzbek states of Maimana, Andkhoy, Akcha, and Shibarghan, all absolutely ruled by Kabul, except Andkhoy; east of Balkh, between it and Badakhshan proper, are the towns and khanates of Kunduz and Khulm. All these Uzbek khanates are in the basin of the Amu-Daria, and together with Wakhan, east of Badakhshan, constitute Afghan Turkestan (see map of AFGHANISTAN).

Balkhash' (Kirghiz *Tengus*; Chinese *Sihai*), a great inland lake near the north-eastern borders of Turkestan, between 44° and 47° N. lat., and 73° and 79° E. long. Lying 780 feet above sea-level, it extends 323 miles WSW.; its breadth at the west end is 50 miles, at the east from 9 to 4 miles; the area is 8400 sq. m. The water is clear, but intensely salt. Its principal feeder is the river Ili. It has no outlet. The northern edge is well defined; but the southern shores of the lake are labyrinths of islands, peninsulas, low sandhills, and strips of shallow water, with enormously tall reeds, in which wild swine shelter. The lake once extended over the arid plain to the south (see ASIA); and from 1890 to 1910 its waters were rising.

Ball, JOHN, a priest who was one of the leaders in the rebellion of Wat Tyler (q.v.), and was in several respects a precursor of Wycliffe (q.v.), having been repeatedly in trouble for heresy from 1366. He was hanged, drawn, and quartered in 1381. See RICHARD II.

Ball, SIR ROBERT STAWELL, LL.D., F.R.S. (1840-1913), from 1892 Lowndean professor of Astronomy at Cambridge, was born in Dublin, and studied at Trinity College. He was appointed Lord Rosse's astronomer at Parsonstown in 1865; professor of Applied Mathematics and Mechanics at the Royal Irish College of Science in 1873; and in 1874 professor of Astronomy at Dublin, and astronomer royal for Ireland. He published works on mechanics and astronomy, of which the best known is *The Story of the Heavens*, besides many magazine articles, and was well known as a lecturer. See his *Reminiscences and Letters* (1915).

Ball. Games with balls were among the most favourite gymnastic exercises of the ancients. They were played almost daily by all, young and old alike; by the highest statesman equally with the lowest of the people. The Greeks prized the game as a means of giving grace and elasticity to the figure; and in their gymnasia, as in the Roman baths, there was a special compartment for ball-playing, where certain rules and gradations of the exercise were to be observed according to the state of health of the player. The balls were of very various kinds; they were

generally of leather, and filled with air; others were stuffed with feathers. Ornamented balls, composed of twelve differently coloured segments (such probably as are to be seen in modern toy-shops), are mentioned in Plato's *Phædo*. There was great variety in the kinds of game, each having a name. In one, the ball was thrown up, and the players strove who would catch it as it fell; another was the same as our football; in a third, a number of persons threw it at one another, either with a view to hit, or for the ball to be caught and returned; in a fourth, the ball was kept rebounding between the earth and the palm of the player's hand as often as possible. Ball-playing seems to have been of equal antiquity in the west of Europe, and to have come down uninterruptedly to modern times. In the 16th century it was in great favour in the courts of princes, especially in Italy and France. Towards the end of the 18th century it went out of fashion in the higher circles of continental society, though it is still practised by the people in Italy and Spain, nowhere with more enthusiasm than among the Basques at the base of the Pyrenees. Forms of it, more or less practised, and all of them separately noticed, are Base-ball, Cricket, Croquet, Fives, Football, Golf, Lacrosse, Tennis, Polo, &c.

Ball. See BULLET, CARTRIDGE, SHOT.

Ballabgarh, a town of India, the capital of a native state of the same name, in the Punjab, which was annexed at the Mutiny and made a tahsil of Delhi district. It contains a palace and several temples, and has a trade in food-grains. Pop. 4000.

Ballachu'lish, a village of Argyllshire, on the south shore of salt-water Loch Leven, 16½ miles S. of Fort-William. Its celebrated quarries, opened about 1760, still yield excellent blue roofing-slate, but are less actively worked than formerly. Glencoe (q.v.) is close by; and 8 miles ENE. is Kinlochleven. See LEVEN (LOCH). Pop. of the village, about 1000.

Ballad. The word ballad is derived through the medium of French from the late Latin *ballare*, 'to dance,' and thus meant originally a song sung to the rhythmic movement of a dancing chorus—a dramatic poem sung or acted in the dance, of which a kind of survival is seen in the ring-songs of children's games at the present day. Now the name is sometimes applied to a simple song, usually of a romantic or sentimental nature, in two or more verses, each sung to the same melody—a form the permanent popularity of which is proved by the crowded audiences at modern 'Ballad Concerts' in London and elsewhere. Such a ballad, as distinguished from a song, has something of the narrative or dramatic; and, however difficult it may be to bring to an exact definition examples on the border-line between the two, this distinction is not obsolete even in the musical world, in spite of modern looseness of phrase. But in literature the name ballad means more particularly a simple, spirited, narrative poem in short stanzas of two or four lines (without counting the burden or refrain), in which a story is told in straightforward verse, often with great elaborateness and detail in incident, but always with graphic simplicity and force. The expression is marked by an artless naïveté and unconsciousness of art—it aims to be merely the perfect and living impress of the reality which it represents. Of all narrative and lyrical forms it is the simplest and most direct in its effect, in its power of representing to the imagination with vividness and truth incidents or natural emotions which it attempts to portray. It deals with the elemental human emotions, and its success as a literary form depends upon the potency with which these are sym-

thetically revived within the imagination of the hearer or the reader. It is obvious that such a form of literary expression is best fitted to a simple and unlettered age, and it is equally obvious that in an age of greater refinement and complexity in the conditions of social and intellectual life, it is difficult, if not impossible, for an artist so to divest himself of the effects of his environment as to reproduce it without affectation and unreality. And this is exactly what we find when we turn to contrast our traditional ballad poetry with the productions of the modern imitative school. Fine poetry though much of its work may be, we feel instinctively that it lacks the spontaneity and genuineness of the antique, the true simplicity born of the absence of self-consciousness—out of the singer's capacity for forgetting himself in his song. We can no more recover the naïveté of the early singers than the grown man can recover the simplicity of the child. But from singers who are wise enough to follow the analogy of nature in her continual advancement to new varieties from antecedent types, we may look for work which, while preserving the traditions of preceding times, will yet represent genuinely the spirit of its own, and save to us all the gains of culture and refinement which the generations have brought us, with something of the earnestness and reality of former days. Coleridge's *Rime of the Ancient Mariner*, Tennyson's *Revenge*, Browning's *Hervé Riel*, and Rossetti's *King's Tragedy*, preserve the best traditions of the ballad, while they are as genuine nineteenth-century poems as *In Memoriam* or the *Ode to a Nightingale*.

Our traditional ballads, then, stand by themselves, and bear upon their face the best evidence of their age. Their makers were not authors by profession, and it is natural that their names should be forgotten. Of course, ballads may have been written by men of any class, especially at a time when all audiences were unlettered and alike in taste, and the possession of literary culture was not the separating line that it is at present. For example, the Spanish romances, which are indeed not a little exceptional, and to be distinguished from the ballads resembling ours still traditional in Spain, are clearly the work of men above the vulgar. Nowhere perhaps has there been a richer growth of really popular ballads than in Sicily, where Pitè tells us as many as seven thousand examples have already been gathered. Here the bulk of the population still stands at that ballad stage which in the evolution of our national culture we Englishmen have already left several generations behind us. Our ballads were made by the people for the people, and they went straight to the hearts of their hearers, who, if they lacked the refinement of their successors, were not less quick to feel the hot human emotions—love, hate, pity, and fear. They were versified originally by unlettered men for unlettered audiences; and passing as they did from mouth to mouth and generation to generation of reciters possessing the literary sense in very varying degrees, it is not wonderful that many changes of omission or alteration have slipped in, and that what are really the same ballads are found in versions differing considerably from each other. Personal tastes and prejudices would interfere, while accidentally discovered felicities of thought or phrase would often occur, and be added to the recited poems by individual reciters, so that it might be wondered at that the differences of versions are not much greater than they are. The ballads must have gained in strength in the course of transmission, as the happy changes would stand and live in the memory, while the feebler words and verses would fall aside and disappear. Molière's old housekeeper had as true a sense for felicity

ot expression as the ladies of the court; so the instincts of the people guided the reciters to the choice of the best word, and when it was found, their memories retained it. But unfortunately the process of transmission has not always been synonymous with a process of refinement or improvement, but has often weakened and spoiled as well as strengthened and amended. Especially is this true with the ballads of the southern English folk, which too frequently are flat, spiritless, and didactic, totally unlike the Scottish and north-country English ballads. The reader cannot fail to be struck by this particularly in the Robin Hood ballads, where so much that is beautiful and artistic alternates awkwardly with the bald and prosy verbiage of the mere rhymester. 'The loyalty, good-humour, and the love of the free air and the green-wood remain, but the clerks have spoiled the praise of Robin Hood, the good outlaw.' Perhaps this is in great measure due to the early printing of much of the English popular poetry in the form of broad-sheets. These were subjected by half-educated editors and printers to a kind of preparation for the press which too often succeeded in stripping the poor ballads of almost all their poetic charm. The printed ballads were scattered broadcast over England, and often pasted on the walls of chambers in country-houses, where they were sometimes fortunate enough to catch the eye of a reader whose sympathies ranged wider than his culture. 'I cannot, for my Heart,' says *The Spectator* (No. 85), 'leave a Room before I have thoroughly studied the Walls of it, and examined the several printed Papers which are usually pasted upon them;' and he describes further how that on a wall he found 'the old ballad of *The Two Children in the Wood*, which is one of the darling songs of the common people.' The people 'love a ballad but even too well, if it be doleful matter merrily set down, or a very pleasant thing indeed and sung lamentably,' and Mopsa's preference for a ballad in print, 'for then we are sure they are true,' may be taken as expressing a not uncommon popular feeling. Indeed the whole passage referred to (*Winter's Tale*, IV. iv. 181-330) throws great light on the subject of the old broadsides, and the warm liking of the people for them. These printed broadsides were long as dear a solace to the southern rustic as the traditional ballads were to his fathers, though by passing through a series of unintelligent and unsympathetic recensions many of them had become so bald as to deserve Dr Johnson's parody:

I put my hat upon my head, and went into the Strand,
And there I saw another man, with his hat in his hand.

In our traditional ballads we must not look for exact dates; but there is ample evidence that a large part of our traditional ballad poetry existed in much the same form as now, more than three hundred years ago. Many of the themes, of course, are much older, and undoubtedly many of the versified ballads also. Already in *The Vision of Piers Plowman* (Skeat's ed., C. Passus viii. 10-12), in the second half of the 14th century, we find Robin Hood a hero of popular song. Sloth says:

Ich can nouht parfytyche my *pater-noster* as the prest hit seggeth,
Ich can rymes of Robyn Hode, and of Randolf, erl of Chestre,
Ac of our lord ne of oure lady, the lest that evere was makid.

Barbour tells us (*The Brus*, book xvi. 520-22, Skeat's ed.; xi. 524-26, Jamieson's ed.) that he thinks it unnecessary to rehearse the account of a victory gained in Eskdale over the English, because:

For guha sa likis, thai may heir
Young women, guhen thai will play,
Syng it emang thame like day.

Leslie, in that chapter in his *History of Scotland* (1594) devoted to the Border manners, notices par-

ticularly the taste of the marchmen for music and ballad poetry. But we need not suppose that the only ballads they cared for were those of battle and bloodshed. Their rude and turbulent lives, full of danger and death, had in them the elements of rare romantic interest, and the pity of life must ever have been present to them as a rich artistic motive that would inspire the poetry of passion and pathos, of despair, or hopeless and interrupted love.

But our popular poetry was for generations the possession of the people alone: it was long before it attracted the notice of the learned at all. Shakespeare knew the old romantic ballads, and worked snatches of them with fine effect into his dramas. Sir Philip Sidney could say: 'I neuer heard the olde song of Percy and Duglas that I found not my heart mooned more then with a Trumpet: and yet is it sung but by some blinde Crouder, with no rougher voyce, then rude stile.' Ben Jonson used to say he would rather have been the author of it than of all his works; and Addison commended the 'majestic simplicity' of the same ballad in two fine papers of his *Spectator* (70 and 74). Yet the ballads continued to be neglected, and it was not till Bishop Percy published his famous *Reliques of Ancient English Poetry* in 1765, that Englishmen awakened to the fact that their popular poetry was poetry at all. Among the ballads in this collection were such masterpieces as 'Childe Waters,' 'Glasgerion,' 'Edom o' Gordon,' 'Edward, Edward,' 'The Jew's Daughter,' 'Old Robin of Portingale,' 'Sir Aldingar,' 'King Estmere,' 'Sir Patrick Spens,' and 'Gil Morice.' Percy admits in his preface that he had made 'a few slight corrections or additions,' as the old copies were 'often so defective and corrupted, that a scrupulous adherence to their wretched readings would only have exhibited unintelligible nonsense, or such poor meagre stuff as neither came from the bard nor was worthy the press.' Perhaps no book ever had a greater or more immediate effect. 'I do not think,' says Wordsworth, 'that there is an able writer in verse of the present day who would not be proud to acknowledge his obligation to the *Reliques*.' The same return to the simplicity of truth and nature took place about the same time in France and Germany, and ere long showed its results as plainly in the lyrical work of André Chenier, of Goethe, Schiller, and Heine. From the *Reliques* Scott drew directly the inspiration that made him a poet and more. In 1802 appeared at the provincial press of Kelso the first two volumes of his *Minstrelsy of the Scottish Border*, the richest single collection of popular poetry that has ever been published. From the publication of this book the northern ballads permanently took their place in public estimation as one of the best and purest sources of English poetry. It was fortunate for English literature that the Border ballads secured, before it was too late, an editor in whom the antiquary had not drowned the poet. Many of the poems were the fruit of raid after raid into Liddesdale, and were in part actually taken down from the living lips of the old men and women who still knew them by heart. It may be regretted, from the point of view of the scientific student, that Scott did not print his texts exactly as he got them, but reference to his originals is possible in some cases, and shows us that Scott's changes—not always for the better—were not by any means so great as might be supposed. Of course, in many cases it is impossible now to say exactly how much they owe to the poetic touch of Scott himself, and we know that it was possible for him to be taken in by ingenious friends; still there is proof enough that here we have what is substantially a body of traditional poetry that fulfils the strictest

conditions of the ballad, and is yet of uncommonly high poetic value. The influence which Percy's and Scott's ballads have had on poetry is enough to prove their intrinsic poetic power: their straightforward diction and artless melody at once became a powerful influence in literature, and made themselves felt in the work of Coleridge, Wordsworth, Keats, Tennyson, Rossetti, and indeed every succeeding poet. Even the zeal of later imitative poetasters, however little according to knowledge, is a tribute to the poetic influence of the form that dominated them, although it did not save them from those faults of obscurity and quaint vagueness of expression, looseness of versification, and inaccuracy of accent, which not unfrequently accompany the merits of the model. Succeeding editors added to Scott's work, Robert Jamieson printing in his excellent collection in 1806 as many as fifteen ballads not before published: among them, 'Burd Helen,' 'Willie and May Margaret,' 'Young Beichan,' and 'Alison Gross.' Motherwell's originals, printed in 1827, were of less value, but many of his alternative oral versions were interesting and important, while his learned introduction contained a good survey of the subject, full of the indignant eloquence of the warm apologist, as well as the sympathetic insight of the poet. Peter Buchan's collection, published in 1828, professed to give north-of-Scotland popular versions, which were discovered to be strangely bald in style, and barren of poetic quality. In the hands of the later editors, the proportion of dross to ore grew larger with each collection, while the modern arts of life killed the conditions which propagated and preserved the ballad. The work of many of the later ballad editors showed no little erudition, though some evidently had more care for the cobweb than relish for the wine. Whether the incidents recorded are historical or legendary, or whether they are partly both; whether the ballads belong to the 16th, or 15th, or any particular century; whether Lady Wardlaw, or any one else, ever added a line, or left one out, are after all questions of but little moment to the Englishman proud of possessing the richest body of popular poetry in the world, and which bears upon its face, in the impossibility of its being imitated, the only evidence of genuineness and antiquity worth anything at all.

Still less important look the discussions of the editors in the light of the results gained from the comparative study of folk-songs. We find that many of our traditional ballads have the same tone, the same incidents, the same iterations of words and ideas as the traditional ballads of Scandinavia, of Greece, of Germany, of Italy, of France, and of Spain. This discovery widens our interest in the question enormously. It strips it of something of its parochial and national interest, but it adds an interest to it that is continuous with our civilisation itself. The plots and situations of many of our traditional folk-songs are the immemorial inheritance of Celts and Saxons, of Greek and Slavonic peoples—of unknown and prehistoric antiquity. Like our folk-tales, they do not belong to one nation in particular, but are the property at least of all the peoples of the Aryan family. 'There are certain incidents,' says Mr Lang, 'like that of the return of the dead mother to her oppressed children; like the sudden recovery of a fickle bridegroom's heart by the patient affection of his first love; like the adventure of May Colvin with a lover who has slain seven women, and tries to slay her; like the story of the bride who pretends to be dead, that she may escape from a detested marriage, which are in all European countries the theme of popular song.' Ballads, of course, have a narrower range than tales. There is here and there a trait common to Europe and Asia,

but the ballads are substantially European. Each nation has a set of its own—not always large—besides the stock in common. It is idle, then, to quarrel any longer over the origin and authorship of these ballads. It is still true, of course, that we have some more or less historical ballads, and that even our purely romantic and non-historical ballads have been powerfully modified by local influences; but the fact remains that a large number of our ballads, and many of their characteristic incidents and qualities, though not their literary style, are not due to the poetic instincts of our own countrymen in particular, but were carried scores of centuries ago in the memories of our distant progenitors from the primeval home of our race. They form part of the stock of primitive folk-lore, and a study of them on the comparative method may be expected to lead to important constructive results in the hands of future scholars. The materials for such study were made available for the first time in Professor Child's monumental edition of the *English and Scottish Popular Ballads* (originally published in parts, 1882-98, and then in five folio volumes), with its learned and luminous introductions to each ballad, culled from a thousand volumes in every language of Europe.

But entirely apart from questions of origin, our popular ballads will repay the most diligent study on their literary side alone. As works of art in which a stock of primitive ideas and incidents has been preserved in poetic dress, they form a perennially valuable portion of our literature, and, as has been shown, they formed the chief factor in that naturalistic reaction from which has flowed the richest stream of nineteenth-century poetry, not yet exhausted after a hundred years. The Robin Hood cycle of ballads and the north-country and Border ballads are the two largest and richest collections of ballad poetry that remain to us; but as has been proved, the latter is infinitely the higher in lyrical quality. The Robin Hood ballads are some forty in number, but include much repetition both of phrase and incident. More than half a dozen are variants of the same story of Robin's meeting an unknown traveller—a tinker, butcher, tanner, shepherd, curtail friar, or beggar—straightway fighting with him, being beaten, and then, in good-humoured admiration of his antagonist's prowess, at once enlisting him in his band of honest outlaws. Among the best ballads of the group are 'Robin Hood and Guy of Gisborne' and 'Robin Hood and the Monk,' the last a good and right spirited heroic tale. The *Lytell Geste* is a set of eight connected ballads, grouped for us by some early and not unskilful editor. 'If these ballads as a whole be tedious,' says Mr Allingham, 'the central figure (whithersoever or howsoever come) is a clear and delightful one, of that small class of ideal personages to which Don Quixote and Robinson Crusoe also belong—a bold, generous, and courteous outlaw, famous in archery, living under greenwood-tree with his merry men, taking from the rich and giving to the poor—a figure that, once lodged in the popular imagination, became an easy and favourite subject for one rhymester after another.' Of all our ballads, the palm for poetry must be given to those especially connected with Scottish and English Border life and story. These formed the richest part of Scott's collection, which contained altogether more than forty ballads never published before, among them such masterpieces as 'Thomas the Rhymer,' 'The Dowie Dens o' Yarrow,' 'The Wife of Usher's Well,' 'Annan Water,' 'The Douglas Tragedy,' 'The Lament of the Border Widow,' 'Clerk Saunders,' 'The Sang of the Outlaw Murray,' and 'Kilmont Willie'; as well as good fresh versions of 'Lord Randal,' 'Helen of Kirkconnell,' 'Tamlane,' and 'The Lass o' Lochryan.'

'Kinmont Willie' can hardly be overpraised as a masterpiece of the heroic ballad, unequalled in fire and speed. The reader is carried along in a whirl of sympathetic excitement, and is left no time to wonder at the marvellous fitness and truth of the words and images. Fighting ballads like this have high historical as well as poetical value, for they reflect closely and accurately the manners and life of the particular people who produced them; and doubtless they had their influence on the rude people who preserved them. The paradox of Fletcher of Salton may be admitted to contain at least some measure of truth: 'I know a very wise man that believed that if a man were permitted to make all the ballads [including also songs], he need not care who should make the laws of a nation.' Some of the fighting ballads of the Border are so vivid and vigorous that we feel the singer had himself ridden in the foray, had heard with his own ears the very clash of steel; nor indeed need the minstrel have struck a feebler blow because he had an ear for ballad metres. The old Border life was rough and rude, but the blood-stains on its grassy holms have watered for us flowers that are among the rarest in the garden of English song. Above all our ballads in value stand those that have clustered round the Yarrow—'fabulosus as was ever Hydaspes.' Its story of love stronger than death has been one of the most potent charms in the world of English poetry, and has drawn some of the finest verse that has ever been written from Hamilton of Bangour, Logan, and Wordsworth.

The best collection of ballads, in all their varying versions, is Prof. Child's great work, *English and Scottish Ballads* (5 vols. 1882-98; superseding his earlier collection, 8 vols. 1857-69); and a one-volume edition, edited by Mrs Child Sargent and Prof. Kittredge (1904), contains all but five of the 305 ballads. Allingham's is a good anthology (1868); and a serviceable collection is *The Ballad Minstrelsy of Scotland* (Glasgow, 1871). Among notable collections have been: *A Collection of Old Ballads* (3 vols. Lond. 1723-25); Percy's *Reliques of Ancient English Poetry* (3 vols. 1765); a beautiful and excellent ed. by H. B. Wheatley, 3 vols. 1886; Herd's *Ancient and Modern Scottish Songs, Heroic Ballads, &c.* (1769; 2 vols. 1776); Johnson's *Scotts Musical Museum* (6 vols. 1787-1803; 3d ed. by Stenhouse and David Laing, 4 vols. 1853); Ritson's *Robin Hood: a Collection of all the Ancient Poems, Songs, and Ballads now extant, relative to that celebrated English Outlaw* (2 vols. 1795; re-edited by Gutch, *A Lytell Geste*, 2 vols. 1847); Scott's *Minstrelsy of the Scottish Border* (3 vols. 1802-3, with its admirable introduction and notes); Robert Jamieson's *Popular Ballads and Songs* (2 vols. 1806); Kinloch's *Ancient Scottish Ballads* (1827); and Motherwell's *Minstrelsy, Ancient and Modern* (1827), with an excellent introduction.

Other collections, but of less importance, are Thomas D'Urfe's *Polls to Purge Melancholy*, containing a ballad here and there (6 vols. 1719-20); Allan Ramsay's *Evergreen* (2 vols. 1724), and *Tea-table Miscellany* (3 vols. 1724-27; afterwards augmented with a fourth volume); Pinkerton's *Select Scottish Ballads* (2 vols. 1783); Ritson's *Select Collection of English Songs* (1783); *Pieces of Ancient Popular Poetry* (1791), *Ancient Songs and Ballads* (2 vols. 1792), and *Scottish Song* (2 vols. 1794); Finlay's *Scottish Historical and Romantic Ballads* (2 vols. 1808); Thomas Evans's *Old Ballads* (2 vols. 1777; enlarged ed. by R. H. Evans, 4 vols. 1784); Gilchrist's *Collection of Ancient and Modern Scottish Ballads* (2 vols. 1815); Hogg's *Jacobite Relics* (2 vols. 1819-21); David Laing's *Select Remains of the Ancient Popular Poetry of Scotland* (1822); C. K. Sharpe's *Ballad Book* (1824); Maidment's *North Country Garland* (1824); Kinloch's *Ballad Book* (1827); P. Buchan's *Ancient Ballads and Songs of the North of Scotland* (2 vols. 1828); Dr Robert Chambers's *Scottish Ballads* (1829); Whitelaw's *Book of Scottish Ballads* (1845); J. P. Collier's *Book of Roxburgh Ballads* (1847); Aytoun's *Scottish Ballads* (2 vols. 1857); and Maidment's *Scottish Ballads* (2 vols. 1868).

The publications of the Percy Society embraced 30 vols. (1840-52), a few of them pertaining to ballads. Indispensable books are Chappell's *Popular Music of the Olden Time* (1855-59; new ed. 1893), and Hales and Furnivall's reprint of the *Percy Folio Manuscript* (3 vols. 1867-68), in which we get behind the good bishop, and see his conception of an editor's duty, and how well on the whole he deserved the wrath of the surly but honest Ritson. It was a surprise to the world to discover that of his 180 ballads, there were only 45 that Percy had taken from his famous manuscript. In 1868 Mr Furnivall succeeded in founding the Ballad Society, which has since published, mainly under the enthusiastic and untiring editorship of Mr Elsworth, the Bagford ballads, the Roxburgh ballads almost entire, and other unprinted collections. The great collection of ballads made by the famous Pepys still remains buried in the library of Magdalen College, Cambridge.

For comparative study may be named the following collections: For France, E. Rolland's *Recueil de Chansons Populaires* (6 vols. 1883-88); for Denmark, Svend Grundtvig's *Danmark's Gamle Folkeviser* (Copenhagen, 1853-90); for Germany, F. K. von Erlach's *Die Volkslieder der Deutschen* (5 vols. Mannheim, 1834); for Italy, Giuseppe Pitre's *Canti Popolari Siciliani* (2 vols. Palermo, 1870); and for Spain, Francisco Rodriguez Marin's *Cantos Populares Españoles* (Seville, 5 vols. 1882-84). See also Countess Martinego-Cesaresco's *Essays in the Study of Folk-songs* (1886), and most of the sixty-nine books named in her list of books consulted.

See Alexander Smith's 'Scottish Ballads' in *Edinburgh Essays* (1856); Mr Hewlett's 'Modern Ballads' in the *Contemporary Review* for November 1875; Andrew Lang's article in vol. iii. (1875) of the 9th edition of the *Encyclopædia Britannica*, and his introduction to the selection in vol. i. (1880) of Ward's *English Poets*; Professor Veitch's *History and Poetry of the Scottish Border* (1877; new ed. 1893); Russell's *Haigs of Bemersyde* (1881); Geddie, *The Balladists* (1900); Frank Sidgwick, *Popular Ballads of the Olden Time* (1905-7); F. B. Gummere, *The Popular Ballad* (1907).

Ballade, a term applied to a poem consisting of one or more terms or triplets of seven- or eight-lined stanzas, each ending with the same line as refrain, and usually an envoy, as Chaucer's *Compleynt of Venus* and *To his Purse*. The foregoing is the strict application of the term—it is now frequently used somewhat more loosely of any poem divided into stanzas of equal length. This form, a favourite of Villon and many of the older French poets, was revived by De Banville, Swinburne, Andrew Lang, Austin Dobson, and others.—In music the term is quite vague. See CHOPIN.

Ballanche, PIERRE SIMON, a French philosopher, was born at Lyons, 4th August 1776, and settled at Paris in 1814, having attracted some notice by his essays and a prize poem, *Antigone*. His great work is the *Palingénésie Sociale* (1828), in which he seeks to illustrate the workings of God in history, and sketch how human society may and will be reconstructed so as to attain to its highest development. His works are a strange mixture of mysticism, socialism, and the philosophy of history. His *Vision d'Hébal* (1832) is a prophetic forecast of the world's history, Hébal being a second-sighted chief of a Scottish clan. Ballanche, who was a member of the Academy, died 12th June 1847. See his Life by Ampère (1848).

Ballantine, JAMES (1808-77), artist and poet, born in Edinburgh, was brought up as a house-painter, but afterwards learned drawing under Sir William Allen, and was one of the first to revive the art of glass-painting. He was commissioned to execute the stained-glass windows for the House of Lords, and in 1845 published a treatise on *Glass Staining*, which was translated into German. Two prose volumes, *The Gabelrunzle's Wallet* (1843), and *Miller of Deanhaugh* (1845), contain some of his best known songs and ballads. He was author of *Poems* (1856 and 1865); *One Hundred Songs with*

Music (1865); *Life of David Roberts, R.A.* (1866), and *Lilius Lee* (1871).

Ballantine, WILLIAM (1812-87), serjeant-at-law, son of William Ballantine, for many years a magistrate at the Thames Police Court, was called to the bar in 1834, and soon obtained a large practice, chiefly in criminal cases. He was created a serjeant in 1856. Amongst the famous trials with which he was associated were the Muller murder trial, Tichborne case, and the defence of the Guicowar of Baroda. From the latter he is said to have received a fee of 20,000 guineas to induce him to visit India. See his *Experiences of a Barrister's Life* (1882); and his *Old World and the New* (1884), an account of a visit to America.

Ballantrae, a fishing-village at the mouth of the Stinchar, in the S. of Ayrshire, 10 miles WSW. of Pinwherry station on the Girvan and Portpatrick Railway. It is the headquarters of the south-west fishery district of Scotland. Fishing is largely carried on. The population is about 700.

Ballantyne, JAMES (1772-1833) and JOHN (1774-1821), Scott's printers, were the sons of a merchant of Kelso, where in 1783 they were both at school with Sir Walter. James was bred for the law, but in 1797 he started the *Tory Kelso Mail*; and in 1802, having already printed some ballads for Scott, he produced the first two volumes of the *Border Minstrelsy*. The beauty of their typography established his fame as a printer; and towards the close of that year he removed, at Scott's suggestion, to Edinburgh, and set up two presses near Holyrood. In 1805 Scott became a secret partner in the business, which in 1808 expanded into the printing, publishing, and book-selling firm of John Ballantyne & Co., Scott having one-half share, and each of the brothers one-fourth. 'Aldiborontiphoscophornio' and 'Rig-dumfunnidos' were Scott's nicknames for pompous James and sporting John; he seems to have liked them both, though sometimes he might plead 'For heaven's sake, treat me as a man, and not as a milch cow.' As early as 1813, bankruptcy threatened the firm, and though its unsaleable stock (Scott's own rash ventures mainly) was disposed of to Constable in 1818, it was hopelessly involved in Constable's ruin (1826). John had died bankrupt five years earlier; and James, after the settlement of affairs, was employed by the creditors' trustees in editing the *Weekly Journal*, and in the literary management of the printing-office. See works referred to under SCOTT; and *History of the Ballantyne Press* (Edin. 1871).

Ballantyne, ROBERT MICHAEL, nephew of the preceding, a writer of admirable tales for boys, was born at Edinburgh in 1825. His first book, issued in 1848, was a record of personal experiences during a six years' residence (1841-47) in the territories of the Hudson Bay Company. In 1856 he took to literature as a profession, making it his aim as far as possible to write from personal experience, and introducing interesting facts and descriptions. His first tales were founded on experiences in the backwoods of Rupert's Land, among the fur-traders and Red Indians; the *Lighthouse* was written after a short residence in the Bell Rock lighthouse; *Erling the Bold*, after a visit to Norway; and *The Settler and the Savage*, after a visit to the Cape. Author of some eighty volumes and an accomplished artist in water-colours, he died at Rome, 26th February 1894. See his *Personal Recollections* (1893).

Ballarat, or BALLAARAT, a thriving city of Victoria, next in importance to Melbourne. Owing its rise to the discovery of gold there in October

1851, it is still the centre of a rich gold-field; when the surface diggings became exhausted after the first rush, deposits were found at greater depths. It is 76 miles WNW. of Melbourne, and 58 miles NW. of Geelong. Ballarat, or Ballarat West, and Ballarat East, separated by the Jarroowee Creek, are separate municipalities. The former was made a municipality in 1855, and a city in 1870. Being 1440 feet above the sea-level, Ballarat enjoys an exceptionally cool and healthy climate. It is the see of Protestant and Roman Catholic bishops. There are two town-halls, some fifty churches, several colleges, and grammar-schools. Among the industries are iron-founding, brewing, distilling, with flour and woollen mills. The 'Welcome Nugget,' discovered in 1858 at Bakery Hill, weighed 2217 oz. 16 dwt., and was sold for £10,500. The South Star shaft is well over 3000 feet deep. In 1854 the indignation of all Victorian gold-miners at unjust taxation culminated in a rising at Ballarat, known, from the mine on which the rioters made their camp, as the Eureka Stockade. The movement was soon dominated by foreigners and political rebels from Europe, who tried to convert it into a revolution, and it collapsed almost immediately thereafter; but the miners' grievances were remedied. Pop. (1901), Ballarat, 25,448; with Ballarat East, 43,710; (1911) 52,551; (1921) 38,500.

Ballater, a village of Aberdeenshire, on the Dee, 43 miles WSW. of Aberdeen, with medicinal springs and Balmoral Castle near it.

Ballenstedt, a town of Anhalt, in the Harz Mountains; pop. 6000.

Ballet, a theatrical exhibition, composed of dancing, posturing, and pantomimic action. Both the religious ceremonies of the Greeks and the dramatic representations which sprang from them were largely intermingled with dancing, and the Roman pantomimes bore a strong resemblance to a modern *Ballet d'Action*, which is a play carried out in dumb show. Such ballets were or are specially popular in Italy and France, where enormous sums used to be spent on their production. In Britain a ballet is usually a mere episode in an opera or play, or a part of what in England is called a Pantomime (q.v.). In the 20th century Russian dancers have introduced elaborations.

Ball-flower, an ornament like a ball placed in a circular flower, characteristic of Decorated Gothic architecture.

Ballina, a seaport in Mayo, on the confines of Sligo; pop. 4700.

Ballinasloe, a small town on the borders of Galway and Roscommon; pop. 5200.

Ballinrobe, a small town of Mayo; pop. 1600.

Ballista, or BALISTA, a Roman military engine, resembling a huge cross-bow, which propelled large and heavy missiles by means of a tightly twisted rope of hemp, flax, catgut, sinew, or hair, or by violent movement of levers.

Ballistic Pendulum. See GUNNERY.

Balloons and Aeroplanes. It has from time immemorial been the ambition of man to soar in the air and to utilise the highway of the heavens. At first the idea was to emulate the birds and to enjoy the experience of floating in mid-air. Later on, however, as the invention became more practical, it developed into a question of economical transport.

I. HISTORY.—As regards the history of human flight, we find numerous allusions to the subject in early writers; but, setting aside mere legends, such as those of Dædalus and Icarus, we read of Archytas of Tarentum, who in 400 B.C. is said to have constructed an artificial dove to fly. Roger Bacon, in the 13th century, wrote suggestions which seemed to foreshadow the balloon, speaking of 'a large,

hollow globe of copper or other suitable metal wrought extremely thin, and filled with ethereal air or liquid fire, and launched into the atmosphere.' Bishop Wilkins published first in 1648 his book called *Mathematical Magick*, in which he discusses the possibilities of human flight. He here relates how Simon Magus, having challenged St Peter to 'do miracles with him' at Rome, attempted to fly from the Capitol to the Aventine Hill; but St Peter's prayers 'did overcome his sorceries,' and violently brought him to the ground and broke his thigh, and 'within a while' he died. 'About the Confessor's time' an English monk named Elmeius is said to have flown from a tower for almost a furlong. Accounts are also given of Regiomontanus of Nuremberg, who is said to have made an artificial eagle in the 15th century. The versatile Leonardo da Vinci has left a number of sketches and notes referring to inventions for flying, which show a very sound grasp of the subject. In 1670 Francis Lana published a book in which he described, with illustrations, a method of navigating the air by means of four large copper vessels exhausted of air. In the 17th century J. B. Dante framed some wings by which he flew, but, after several successes, finally fell and broke his thigh. In 1678 one Besnier constructed an apparatus, consisting of four wings attached to his hands and feet, by which he could at least descend from an eminence, and even cross a river. In 1709 a friar named Bartholomew Laurence de Gusman presented to the king of Portugal a design for a flying-machine. Many other suggestions, more or less fanciful, were put forward, though no full descriptions remain to enable us to judge as to their real value. A complete change in ideas for the navigation of the air occurred when, in 1766, Cavendish discovered that hydrogen (then called 'inflammable air') was at least seven times lighter than atmospheric air; and Dr Black, in lecturing on the subject, distinctly stated that if a light receptacle were filled with hydrogen it would rise up in the air. He even tried the experiment, but not on a large enough scale, and he was unable to find any substance which was sufficiently gas-tight and yet light enough to rise. Cavallo, a few years later, succeeded in inflating soap-bubbles with hydrogen, which rose to the ceiling, and this experiment was henceforth frequently repeated. But it was on different lines that the first balloon was made. The brothers Montgolfier of Annonay, noting how smoke rose in the air, bethought them to enclose some smoke in a large paper bag, so as to form an artificial cloud. In this they succeeded, and sent aloft the first fire-balloon in 1782. After many and various trials, a public demonstration was given on 5th June 1783. The balloon consisted of an immense bag of linen lined with paper, having a capacity of some 23,000 cubic feet. It was inflated by lighting a fire of chopped straw under the aperture at the bottom. The machine ascended to a height estimated at 6000 feet. This extraordinary experiment having become the talk of the day, it was not unnatural that the more scientific exponents began discussing the possibility of Dr Black's ideas being carried out in a practical way; and M. Charles, a professor of experimental philosophy in Paris, at once set about constructing a gas-balloon. It was about 13 feet in diameter. On 27th August this machine made its first public ascent from the Champs de Mars before a huge assemblage. It rose into the clouds, and travelled for 15 miles before descending; but on landing it caused the greatest consternation among the superstitious peasants. On the 15th of October 1783 the first actual ascent was made by a man. M. Pilâtre de Rozier on that day made several captive ascents in a Montgolfier balloon. On the 21st November the first free ascent was made by M. de Rozier and the Marquis

d'Arlandes, who, ascending from the Château de la Muette, made a voyage lasting about twenty minutes. But again M. Charles was not to be outdone, and accordingly he, together with M. Robert, made an ascent in a hydrogen balloon on 1st December 1783. This balloon was wonderfully like the ordinary balloon that we use to-day. The voyage lasted about two hours; but as there was still plenty of gas left, M. Charles again ascended alone, and attained an elevation of nearly 10,000 feet. The first ascent in England was made on 15th September 1784 by Vincent Lunardi, secretary to the Neapolitan Embassy, who published a most delightful account of his trials and experiences; though J. Tytler had a few weeks previously made a short ascent in a fire-balloon in Edinburgh. The first demonstration of the non-insularity of Great Britain, from the aeronautical point of view, was when, in 1785, Blanchard, the first professional aeronaut, accompanied by Dr Jeffries, an American, crossed the Channel from Dover to the Forest of Guignes. Shortly after this occurred the first disaster, when in the next attempt to cross the Channel the intrepid Pilâtre de Rozier lost his life. The balloon he used is of interest as an attempt to improve upon the system, though in a misconceived manner. Since the fire-balloon has the advantage of being able to rise and sink as desired by merely adding more or less fuel, while the gas-balloon has the advantage of better lift, this inventor thought of combining the two, placing a hot-air compartment below the gas-reservoir. The result was of course disastrous, for before the machine had been in the air a few minutes the hydrogen took fire, and Rozier and a companion were dashed to the ground. Many fatalities occurred before the real dangers of ballooning became apparent. Count Zambeccari, in Italy, was killed through the ignition of his fire-balloon; Madame Blanchard took up a set of fireworks, which set alight the gas, and she was killed.

Although no very striking events occurred during the earlier part of the 19th century, many notable ascents were made. The Sadlers, father and son, made attempts to cross the Irish Channel, and had thrilling adventures in doing so. Mr Windham Sadler lost his life in an accident in 1824. Charles Green, perhaps the greatest of aeronauts, introduced the practice—which resulted in ballooning becoming much more popular—of inflating with coal-gas instead of the costly hydrogen. In 1836 he, together with Messrs Holland and Monk Mason, made the memorable journey, which for long remained a record for ballooning, of going from London to Weillburg in Nassau. This lasted 18 hours, and was said to be 500 miles, although from point to point it was certainly nothing like so much. About this period (1835) John Wise commenced his great career as an aeronaut, making ascents all over the United States. He made one voyage, in 1859, of 850 miles, and he formulated a project for crossing the Atlantic in a balloon. Nadar, a Parisian photographer, had for some years been strenuously advocating the navigation of the air by 'heavier-than-air' machines. Having written much on the subject, he next adopted the rather odd course of building a huge balloon, to be the last of its kind, and to make a series of voyages which were to bring in a goodly sum to be devoted to his cause. The 'Géant' was of 215,000 cubic ft. capacity, and had a small balloon attached below the main one to receive the excess of gas. The first ascent was made on 4th October 1863 with 15 passengers, but it did not last very long, and a rough descent was made near Meaux. A fortnight later a second ascent was made, but after a voyage of 17 hours a still worse descent was effected, the car being dragged

along the ground for some miles, and most of the passengers being severely hurt.

In 1862 began the series of ascents by Glaisher, of the Greenwich Observatory, piloted by Coxwell, for the purpose of the scientific investigation of the upper air. During the seventh ascent, on 5th September, a height of 29,000 feet was reached, when both aeronauts became nearly insensible, and it was conjectured that they eventually attained a height of 7 miles. Coxwell, unable to use his arms, pulled the valve-line with his teeth! During the siege of Paris in 1870 a number of balloons were used to take letters and passengers out of the city. Most of the balloons were specially constructed, two regular factories being started for the purpose. In all 67 balloons (including one without a man) left Paris, carrying 164 persons, 381 carrier-pigeons, and about 23,000 lb. of letters and despatches. In 1875 a terrible disaster happened to a balloon in France, which went up for scientific observations. After rising to about 23,000 feet, notwithstanding that the aeronauts were provided with oxygen-tubes all three became insensible, and when M. Gaston Tissandier came to, he found that his two companions, Messrs Croce-Spinelli and Sivel, were dead. It is supposed that they had ascended to 27,950 feet. On 4th December 1894 Dr Berson ascended from Berlin, and attained a height of just over 30,000 feet, the record for well-ascertained altitude. What was undoubtedly the most hazardous journey ever undertaken was when, in 1897, Andrieu, together with two companions, Strindberg and Fraenkel, left Spitsbergen in a balloon of 162,000 cubic ft. to attempt to get to the Pole. Since the start on 11th July nothing more has been heard of them except for a pigeon-message, dated nearly 48 hours later, saying all was well. In October of that year a large balloon, which had been used as a captive at the Leipzig Exhibition, ascended with 8 passengers, and remained up for 24 hours. It is computed to have travelled 1032 miles, the longest journey hitherto made. A very long journey was made in 1905 by Dr Wegener in Germany, when he remained in the air for 52 hours. The following year Count de la Vaulx travelled from Paris to Korostischeff in Russia, a distance of nearly 1200 miles, in 35½ hours. The longest sojourn in the air, however, was achieved by Colonel Schaeck, representing Switzerland in the Gordon-Bennett race in 1908. He remained in the air for 73 hours, travelling from Berlin to Borset in Norway. The longest journey from England was made in the same year, when Messrs Gaudion, Turner, and Captain (now General) Maitland travelled 1117 miles from London to Russia.

A word should be added about the small balloons sent up with automatically recording instruments for meteorological observation. During the last few years systematic ascents have been organised, bringing results of the highest importance to our knowledge of the upper atmosphere. Observations have been recorded at heights of over 16 miles above the earth.

Captive Balloons.—As has been said, in the first ascent of a human being in a balloon the machine was held captive by a rope, and since that time captive balloons have frequently been used for many purposes. Only ten years after the first ascent such balloons were used by the French in the campaign in Flanders, notably at the battle of Fleurus. They were also used in the American Civil War. In later years captive balloons were often made a feature at various shows, carrying up passengers to see the view. The largest ever made was that at the Paris Exhibition of 1878, which contained 883,000 cubic ft. of hydrogen and could carry up 52 people at a time. They have more recently been generally adopted for military purposes, but it was in the recent great war that they were developed beyond

all precedent, many hundred 'kite-balloons,' of an elongated shape with an air-inflated fin tail, being employed on both sides. In the future such vessels are likely to be much used as landmarks over aerodromes.

Dirigible Balloons or Airships.—Soon after the first balloon ascents had been made, it became evident that if the invention was to be of real use some means must be found whereby the apparatus could be driven in a given direction, instead of being carried along exactly with the wind. At first various forms of sails and rudders were suggested, but these, of course, were of no avail. The mere fact of adding extra surfaces to the machine could have no effect in altering its course, however they might be disposed. Then it was proposed to apply power to screw or other propellers, although in these early days no engines of suitable power for their weight were available. General Meusnier elaborated a scheme which is practically the dirigible of to-day; but it was not till 1852 that Giffard, the inventor of the Injector (q.v.), made an actual balloon of elongated form to be driven with a screw-propeller rotated by a steam-engine. This, however, was not a great success, since the heaviest engine he could carry only developed about 3 horse-power, which later experience has proved to be altogether inadequate. Other inventors followed with no better success, till the French government, realising how important such a machine might be in war, constructed an airship to the design of Colonel Renard, which, driven by an electric motor of 9 horse-power, succeeded in making several long return journeys in the neighbourhood of Paris. This was in 1885. In 1898 and following years a young Brazilian, Santos-Dumont, constructed a number of small dirigibles, with which he created a great deal of public interest, and made many successful journeys. Meanwhile, in Germany, Count Zeppelin, who had long made a study of the subject, built one of his huge airships, with a rigid frame of aluminium, and, after many failures, succeeded in 1900 in making some satisfactory trips. Quite a number of new machines were brought out about this time, including two—those of Baron de Bradsky and M. Severo—which met with disaster, resulting in the deaths of their aeronauts. Among other airships which made their appearance about this time was that constructed for Messrs Lebaudy to the designs of M. Julliot. This vessel may be considered as the first undoubtedly successful dirigible, as it was capable of travelling some 25 miles an hour, and made about sixty entirely successful journeys before it was taken over by the military authorities. In Germany considerable progress was made with various different types. In addition to the several Zeppelins which were in turn constructed, Major von Parseval designed some of a non-rigid form, which acted very satisfactorily; and Major Gross built others for the government of a semi-rigid kind. In France a new type was developed at the Clement-Bayard works. During the year 1910 a number of events occurred which tended to check the progress of the dirigible. Four large Zeppelins were wrecked, two of the Lebaudys came to grief, and other airships also met a similar fate. During the same year two large dirigibles came over to England from France—one the Clement-Bayard II., which was bought for the government; the other the Lebaudy, which was acquired by the *Morning Post* with the object of presenting it to the War Office. Opinions were at this date still much divided as to the desirability of acquiring either of these in view of their doubtful efficiency. Not much progress followed. Willows and others in England built several small airships which achieved some success. A type of Zeppelin, but with a wooden framework, was tried in Paris, and a good deal was accomplished with small vessels in the

United States. The main advance was with the Zeppelin machines in Germany. Many large vessels were built, and a regular installation of such machines was established in several of the principal German towns for pleasure-trips. The German government, foreseeing the uses to which they could be applied in war, gave support to the movement, and acquired several vessels for military use. The first naval airship of this kind in 1912 covered a distance of over 1000 miles in a 30-hour flight. In May 1914 the latest Zeppelin made a cruise of 34 hours, during which it attained the unprecedented height of over 10,000 feet. When hostilities broke out in 1914 Zeppelins were consequently well to the fore. Germany possessed about 23 airships at this time. The British government owned 3 small ones. In December occurred the first of the many raids over England. These were mostly carried out during the night, and a great many large bombs were dropped; though, happily for us, the majority fell in open country.

About forty such raids were undertaken, and at first we seemed to be unable to do much to prevent them. However, our aerial defences became better organised, and on 3d September 1916 the first of these raiding airships was destroyed by an aeroplane, being brought down in flames at Cuffley. Late in the same month two others were shot down, and a fourth Zeppelin was destroyed within a month. Other vessels on their return from a raid were forced to descend in France. These disasters to the German air-fleet demonstrated the vulnerability of such large and frail machines when opposed by an organised defence of modern artillery and aeroplanes, and they ceased to be employed for such raids. They were, however, still of great value for naval reconnaissance, and it is said that it was owing to their assistance that the German fleet was enabled to escape at the battle of Jutland.

The British government had been energetically pushing forward the construction of a number of small airships of the 'S.S.' type, carrying 3 men, which were chiefly used as naval scouts for 'spotting' submarines and convoying merchant-ships. Larger vessels were also used, and towards the end of the war we possessed over 100 airships. Some large rigid airships of the Zeppelin type were also constructed in England, though not in time to take any active part in the hostilities. One of these, the R 34, starting on 4th July 1919 from East Fortune in Scotland, crossed the Atlantic, and landed on Long Island, New York, completing 3130 miles in 4½ days. After a stay of a couple of days, she started on the return journey, and arrived back in England in 3 days 3 hours.

Aeroplanes.—The history of the modern aeroplane may be traced back to the days of Sir George Cayley, early in the 19th century; but although his writings were sound and attracted some attention, not much was done to apply their principles. Later on, in 1843, Henson published details of a device which was practically what we now know as a monoplane. Wenham's paper to the Aeronautical Society in 1866 introducing superposed planes also created much interest. But though the writings and designs of these pioneers undoubtedly had their influence, it was not till Langley, in 1891, published the results of his experiments in aerodynamics that any real scientific interest in the subject was aroused. Meanwhile Ader had been at work in France experimenting with an actual machine, and with this, though no details were published at the time, he is said to have made more than one successful flight of short duration. In 1894-95 Maxim built his great aeroplane, with steam-engines developing 300 horse-power, and ran it along rails. Unfortunately, while running, the machine broke loose, and, after jumping through

the air, fell, and was so badly wrecked as not to be worth repairing. In 1897 Langley's steam-driven model succeeded in travelling three-quarters of a mile through the air, a great triumph for a non-controlled machine. Meanwhile Lilienthal, in Germany, had been making a series of experiments with a glider, built up of canvas stretched on poles, and very similar in appearance to the outstretched wings of a bird. Resting his arms on the frame of this, he jumped off from the top of a hill and glided down through the air. He made some hundreds of such glides, and deduced many valuable data. Pilcher had also been at work in England with somewhat similar appliances. Unfortunately both these experimenters met with fatal accidents. Chanute, in America, had also been developing gliders, and the brothers Wilbur and Orville Wright continued the developments. Hitherto the great difficulty had been that no practical engine existed capable of developing sufficient power without prohibitive weight. The petrol internal-combustion engine was, however, now coming into general use, and a specially light model of this was eminently suitable for the purpose. In 1905 the Wrights applied such an engine to drive two large propellers on one of their biplane gliders, and a very marked success resulted, although nothing was published at the time to give the world any idea as to the great developments which were being carried on. In September they made flights up to 12 miles, and during October they succeeded in flying up to 24 miles, and remaining in the air for 30 minutes on end. In the following year, as rumours of the Wrights' doings got abroad, many investigators set to work, experimenting on a large scale. In France Archdeacon and Captain Ferber made flights with gliders; and on 13th September 1906 Santos-Dumont, in a curious cellular aeroplane with a long girder-tail in front, rose off the ground and flew for about 12 yards. Two months later he improved his flights, and remained in the air for 21 seconds. After a year of experiments Henry Farman came forward with a Voisin biplane, on which he flew for over 800 yards, and on 9th November completed a circular flight. He soon bettered the record, till on 6th July 1908 he remained in the air for 20 minutes. Léon Delagrangé also made several flights on a similar machine, as did Blériot and Esnault Pelterie on monoplanes of their own construction. Meanwhile the Wrights had started experimenting again in America, and made some good flights, although still conducting them in secrecy. Then in July Wilbur Wright came over to France, and started making flights in public, and for the first time the mysterious Wright aeroplane was photographed and described. Day after day he flew, often for half-an-hour or more, and generally with a passenger. On 31st December he remained up for 2 hours and 19 minutes. Orville Wright was meanwhile demonstrating for the United States government at Fort Meyer, but on 17th September experienced a terrible accident, by which his passenger, Lieutenant Selfridge, was killed. M'Curdy, in Canada, made a number of good flights on several different machines; and Glenn Curtiss, in the United States, also flew on a biplane of his own design. Cody, at the military balloon school at Aldershot, made many more or less successful flights—the first in England. A. V. Roe also flew on a triplane. The 25th July 1909 must ever be a date to record, for on that day the Channel was first crossed by an aeroplane. This was a small monoplane steered by Louis Blériot, who started from near Calais, and landed at Dover, after a flight of 37 minutes. The first large public aviation meeting was held at Rheims on 22d to 29th August, and this was the occasion of opening the eyes of the public to

the marvellous strides that had been made in the practical navigation of the air by aeroplanes. A large number of machines were on the ground; though, it must be owned, the majority made but a poor show of flying. Nevertheless, the Blériots, the Farman, the Antoinettes, as well as the Curtiss, made some very creditable performances. Farman remained in the air for 3 hours 4 minutes; Latham, on the Antoinette, made the record high flight, although that only amounted to 508 feet; while Curtiss won the Gordon Bennett prize for speed at 47 miles per hour. What was even more satisfactory was that there were no serious accidents during the meeting to mar the sport. However, on 7th September, Eugene Lefebvre, who had distinguished himself by his audacious flights at Rheims, met with a fatal accident at Juvissy; and only a fortnight later Captain Ferber, one of the most scientific pioneers of flight, was killed while landing in a Voisin machine. In October two aviation meetings were held in England, at Blackpool and at Doncaster, but nearly all the prizes were won by Frenchmen. In January 1910 L. Delagrange was killed while flying a monoplane near Bordeaux. In April took place an exciting competition for the prize of £10,000 which had been offered by the *Daily Mail* for a flight from London to Manchester. Mr Grahame White made a start, but a Frenchman, Louis Paulhan, succeeded in completing the course in two stages of 117 and 66 miles, and won the prize. On 2d June the Hon. C. S. Rolls, on a Wright biplane, flew across the Channel and back again to Dover. In July was held a great aviation meeting at Bournemouth, in which, unfortunately, there were several serious accidents, including one which resulted in the death of Mr Rolls. These unfortunate disasters seemed likely seriously to check the ardour of British airmen; but the dangers were soon forgotten, and a very successful meeting was held at Lanark two months later. At this several records were beaten, Drexel ascending to over 6000 feet, and Radley, on a Blériot monoplane, flying a mile at the rate of 76 miles an hour. It may here be remarked that speed records must ever be very dependent on the wind; even on a circular course a strong puff may make a considerable difference in increasing or retarding the speed. In November M. Tabuteau flew, on a Maurice-Farman biplane, for over 6 hours on end at Étampes, the distance being recorded at 290 miles. Also in this month the height record was beaten by Johnstone at New York, when he attained a height of 9714 feet. Records for distance flown, speed, and height attained were continually being improved upon during the next few years. In March 1912 Salmel flew from London to Paris and back. A month later the Channel was first crossed by a woman-pilot, Miss Quimby. The Irish Channel was also crossed; and in June of that year was held the first 'Aerial Derby' race round London. The War Office now began to recognise the great possibilities of aeroplanes for war purposes, and in 1912 offered some valuable prizes for competition. S. F. Cody won £5000 for an all-British machine, but was unfortunately killed shortly after by his machine falling. Wilbur Wright died of typhoid-fever in May, and many fatal accidents occurred to pioneers. In 1913 Pegoud created a great sensation by demonstrating the possibility of 'looping the loop' and flying upside-down. G. Hamel, who had accomplished many great flights, was lost in the Channel in May 1914. Legagneux attained over 20,000 feet, and Bohn, in Germany, remained in the air for over 24 hours. The Great War, commencing in 1914, resulted in enormous developments in flying. Although the first use of aeroplanes in war had occurred in the Mexican rebellion of 1911,

and such machines were employed in the Balkan war shortly afterwards, these were but mere experiments. At the outbreak of hostilities there were but 272 government-owned aeroplanes in England, while the Germans were said to possess 470, and the French about 500. At the conclusion we had no less than 22,000 aeroplanes, and they were being constructed at the rate of 4000 a month. At first, though comparatively few machines were in use, and these of varied makes and efficiencies, they soon proved their great value for reconnaissance, directing artillery fire, and photographic survey. All combatants recognised their value, and soon the number of machines greatly increased, which resulted in numerous combats in the air. Throughout the war some 8000 enemy machines were shot down, with a loss to our side of 2800. Regular types for different uses developed. There were the scouts, the fighting-machines armed with machine-guns, and the bomb-droppers. Bombing raids were carried out for hundreds of miles over the enemy country. Aeroplanes not only engaged other machines, but attacked troops in the open with their machine-guns; while they were also used for supplying the front-line troops with ammunition and even with food. In January 1919 the height record was broken in England by two officers, who reached an elevation of 30,500 feet. Mr Hawker and Commander Grieve started in May to cross the Atlantic from Newfoundland, but were forced to come down when half-way across, and were rescued by a passing ship. Shortly after this three American seaplanes started to cross *via* the Azores, and one succeeded in reaching England in three stages. On 14th June Captain Alcock and Lieutenant Brown left St John's, Newfoundland, in a Vickers-Vimy aeroplane, and flew to Clifden, Ireland, covering 1950 miles in 16 hours 12 minutes. Both aviators were knighted in honour of this great performance of crossing the Atlantic in one flight, but Sir J. Alcock was soon afterwards killed in a flying accident. In August 1919 a regular daily service between London and Paris for mails and passengers was first inaugurated. Leaving Hounslow on 12th November 1919, Captain Ross Smith, with his brother and two mechanics, flew, in a Vickers-Vimy aeroplane, from England to Australia, travelling a distance of over 11,000 miles in 28 days, and thus gained a prize of £10,000 offered by the Australian government. The machine was equipped with two Rolls-Royce engines of 350 h.p. The two pilots were knighted.

The Royal Flying Corps was organised in 1912, with a military and a naval wing, but these were also absorbed into the Royal Air Force in April 1918. At the end of the war the force had 30,000 officers, but the establishment in peace-time is to be 5300 officers and 54,000 men, divided into 102 squadrons.

Kites.—Although a device consisting of some sort of framework covered with paper or cloth, held by a long string, to be carried aloft by the wind, has been known for countless ages and in almost all countries, yet it seems remarkable that until quite lately it has hardly ever been applied to practical purposes. Passing by these mere toys, and the classical experiment of Franklin, who demonstrated by such means that lightning was the discharge of electricity, we come to the period since 1890, during which such appliances have been used for meteorological research, for photography, for signalling, advertising, and, finally, for carrying up men for military observation. Of those who have improved the kite into a useful instrument none deserve more credit than Lancelotti Hargrave, who in 1894, near Sydney, N.S.W., devised a 'cellular' kite, which developed into what is now known as a 'box' kite. The idea of sending up meteorological instruments on a kite

is not very new. D. Archibald made a series of observations in this way many years ago, but more recently a regular service was inaugurated at the Blue Hill meteorological observatory near Boston, and such observations have been regularly conducted in many parts of the world, notably by Dines in England, T. de Bort in France, and Professor A. Laurence Rotch in America. Such kites have been sent up to enormous heights. As regards man-lifting by kites, the idea has often been suggested, and even tried, but without much success, until Major Baden-Powell, in 1895, demonstrated their utility, using a kite 36 feet high to lift a man some few feet. Finding practical difficulties in using one big kite, he next strung together five or six of about 100 sq. ft. each, and by this means he frequently ascended to a height of 100 feet. On 18th September 1895 he gave the first public demonstration, before the British Association at Ipswich, and a number of trials of the apparatus were made at Aldershot. About this time Lieutenant Wise in America, and Mr Hargrave in Australia, also made some ascents on kites. Some years after Mr S. F. Cody devised a system of man-lifting kites, and these were adopted as the army pattern. Kite equipments were regularly used in the army, ascents being made on days when the wind was too strong for captive balloons. Men have on several occasions been up to a height of 3000 feet.

Parachutes.—Leonardo da Vinci both described and sketched a parachute, and several old illustrations are extant proving that a large surface of cloth with ropes depending from its edges had often been used in early times to enable a man to descend from a height, such as a tower, in safety. Such an appliance was first used from a balloon by Blanchard in 1785, but only to let down a dog. Garnerin, a few years later, was probably the first man to descend from a balloon, and he made many exhibitions of the feat both abroad and in England. In 1837 Cocking invented a new form of parachute, like an inverted cone, which he imagined would be steadier in its descent than the ordinary shape; but when released from a great height from Green's balloon over London, the machine collapsed, and the inventor was killed on the spot. In later times thrilling exhibitions have been given by Baldwin and many others. But it was not till the war, when captive balloons were so largely used for observation, and were so often attacked and set on fire, that the parachute became a recognised article of military equipment, and by its means many an aerial observer was able to save his life by jumping from a burning balloon. Parachute descents from aeroplanes travelling at high speed have also been successfully accomplished.

II. DESCRIPTIVE.—Having thus recorded the chief events in the history of aeronautics, we may now describe briefly the various appliances in use.

Balloons.—The balloon is a nearly spherical bag, made of silk, or more usually of cloth, varnished or prepared with india-rubber, so as to render it gas-tight. The British military balloons, however, were for many years formed out of a number of layers of gold-beater's skin (the intestines of an ox), firmly cemented together. Over this envelope is spread a network of hempen cords, from which is suspended the basket-car to contain the passengers. At the top is a large wooden or metal valve, which is kept closed with springs, but which can be drawn open by means of a cord which hangs down through the middle of the balloon to the car. At the bottom the 'neck' is left open, so that the gas can escape when the pressure becomes great, as it does when the vessel has attained a height. Most balloons are now fitted with a 'ripping panel' and cord, so that on emergency, such as in landing in a strong

wind, the envelope can be torn right down and immediately emptied of its gas. An anchor is provided to hold the balloon when landing, and a long 'guide-rope' is suspended below the car, so as to ease the descent and trail over the ground to facilitate the landing.

Airships are divided into three types—(a) *rigid*, in which there is a framework or skeleton, over which a skin is stretched, and within which a number of balloons are placed; (b) *semi-rigid*, in which the lower part only of the balloon is distended on a flat framework; and (c) *non-rigid*, when a gas-bag of elongated form has a long girdel suspended below it. In the last two types the envelope is kept in shape by the gas being under pressure. This is effected by means of a 'ballonet,' or small balloon, placed inside the larger one, and blown out with air as tight as required. To prevent pitching, which was a difficulty with earlier machines, an 'empennage' of flat surfaces is usually arranged near the after-end. Of the first, or rigid, type the Zeppelins stand foremost. The first of these, built in 1898, was 400 feet long, with a capacity for lifting 11 tons, and was provided with two engines of 16 h.p., which could propel it at a rate of 17 miles per hour. The 1917 model had 60 tons of gross lift, with 1200 h.p. engines, and was capable of travelling 70 miles an hour through the air. Of British airships, the R 34, completed in 1919, is 639 feet long. The framework is of duralumin (an alloy of aluminium) of stream-line form (that is, fish-shaped, with pointed tail). Four cars or gondolas are slung beneath the keel, each containing an engine of 250 h.p., and one of them two such, so that the full engine-power is 1250 h.p., working four propellers. On the top of the vessel is an observation-platform. Of the semi-rigid type the Lebaudy vessels were the prototype, and several later machines are designed in a somewhat similar manner. The non-rigid type includes the small 'S.S.' machines, with a capacity of about 70,000 cubic ft. and an engine of 75 h.p.; also the larger 'Coastal' vessels, and the still bigger 'N.S.' type, of 360,000 cubic ft., with two engines each of 260 h.p.

Aeroplanes.—After the first invention of aeroplanes a number of different designs were introduced. The original Wright machine was of that class known as a *biplane* from having two planes arranged one above the other (which gives a strong girder structure). Each plane was 41 feet in span by 6½ feet 'chord'—that is, from front to rear. Fifteen feet in front was the elevator, consisting of two small superposed planes, while in rear two vertical rudders were placed. The *Farman biplane*

Biplane.

was much used in the early days. It had an elevator fixed out in front of the machine, and a box-tail in rear, the propeller being placed in rear of the planes. Flaps or 'ailerons' were arranged at the back of the outer ends of the planes for accomplishing the same objects as the Wrights' warping arrangement. The total surface was about 470 sq. ft., and it was usually driven by a Gnome

engine of 50 h.p. One other of the early machines is worth describing as having introduced several novelties. This is the *Blériot monoplane*. It had but a single pair of wings about 28 feet in span, which had to be stayed with numerous wires to struts above and below. There was a 'fuselage' like that of the modern machine, with elevator and rudder at its after-extremity. But a special feature was the tractor-screw mounted in front, which arrangement has been adopted in almost all aeroplanes of to-day. Experience gained during the war soon resulted in one type only becoming universal, and that is the biplane with fuselage and a tractor-screw (or screws) mounted in front. Engine-power has steadily increased from the 25 h.p. of the Wrights, the 50-h.p. 'Gnome,' and other engines of the first aviators, till now few machines have less than 80 or 100 h.p., and some of the very big machines (which are of the same general design) have four or even five engines each of 350 or 400 h.p. Such a machine can lift 15 tons, and 40 passengers have been carried in one. Speeds up to 170 miles per hour have been attained. The *seaplane* is like an ordinary aeroplane, but fitted with floats instead of wheels. In the *flying-boat* type the whole fuselage forms a boat to float on the water. Some of the larger machines are *triplanes*—that is, have three sets of wings, one above the other. Although all the older aeroplanes were built of wooden frames covered with varnished cloth, some of the later ones are constructed entirely of metal.

III. THEORETICAL PRINCIPLES.—There are two main principles of constructing apparatus by means of which a body may be caused to rise and be maintained in mid-air. These are, by displacing a volume of air with a substance of lighter bulk, and, secondly, by causing an upward pressure of air on a surface driven through it.

Displacement.—Air at ordinary temperatures and pressure weighs about .076 lb. per cubic ft. If, however, this air be warmed its volume will be increased, or, that is to say, an equal volume will be of less density. The volume may be taken to increase about one five-hundredth part for every degree Fahrenheit. Hence, if the air in a balloon be heated through 100°, one-fifth of the weight of air will be expelled. So, if the balloon has a capacity of 1000 cubic ft., 200 feet, weighing 15 lb., will be dispensed with, and a nearly equivalent weight can be raised in the air. Of substances lighter than air, the lightest of all is hydrogen, which weighs but .005 lb. per cubic ft., so that a balloon of 1000 cubic ft. would lift about 70 lb. (In practice, the purity of the gas, the temperature, pressure, humidity, and other circumstances must be taken into account.) Helium, which has a lifting-power of 92 per cent. that of hydrogen, has recently been suggested as a suitable gas for inflating airships, being unflammable. It has been obtained in large quantities from natural gas in Canada. Coal-gas varies with the kind of coal and the temperature at which it is produced, but may be taken at about half the weight of ordinary air. Ammonia and steam have also been applied tentatively to ballooning.

Air-Pressure.—The theory of the support of bodies by the reaction of air pressing them upward against gravity is a more intricate subject to deal with. There are several ways in which this system may be applied, but the only one hitherto practically utilised is that of an inclined plane driven in a more or less horizontal direction, so that the air impinges on the inclined under-surface. This applies both to the typical aeroplane and to the pair of planes fixed together, and revolving around a common point which forms the lifting-screw or 'helicopter.' In order to arrive at the pressure which the air exerts on an inclined surface, we

must first find what the pressure is on the surface when at right angles to the flow, and it is evident that that on the inclined surface will be proportional to the angle of inclination. Langley in 1891 published his *Experiments in Aerodynamics*, which changed many preconceived notions on the subject, and his conclusions have been corroborated by almost all subsequent experimenters. He showed that the pressure of the air in pounds per sq. ft. on a plane surface might be taken to be .003 times the square of the velocity in miles per hour. Without quoting the many complicated formulae which have been brought forward, we may give that of M. Eiffel, which has the advantage of extreme simplicity, and gives results very much in agreement with most of the recent authorities. It is that the pressure on a square inclined plane is equal to that on the plane at right angles, divided by one-thirtieth of the angle of inclination. What we are most concerned with is the pressure at very small angles of inclination, since the practical aeroplane acts at angles under 5° to the horizontal. Now the force acts normally or at right angles to the plane, and it may theoretically be considered as the combination of two forces—one acting vertically, and therefore in opposition to gravity; the other acting horizontally, opposing forward propulsion. Therefore, knowing the weight it is necessary to support, we may find the power necessary to apply to keep it up, or, knowing the thrust of the propellers, we may arrive at the weight it will sustain. These forces are known as 'lift' and 'drift' respectively. There are a great many points to be taken into consideration in calculating the actual lift of an aeroplane. First, what is called the 'aspect ratio'—that is, the proportion between the span from side to side and the length from front to back. This makes a considerable difference in the lifting-power. The after-part of the plane, receiving only the air which has already been diverted by the front part, is not so effective; hence the 'entering edge' is all-important. Then size has to be considered, for it has been shown that a large plane possesses a slightly greater lift in proportion to a small one. The profile has also a considerable influence on the result. If it is slightly curved so as to be concave underneath, or 'cambered,' the lift is increased. Moreover, experiment tends to show that if the upper side presents a larger curvature than the lower, especially if the greatest thickness be towards the front, greater efficiency results, and that the suction of the displacement of air above the plane is even more effective than the pressure underneath.

Ballot is a little ball used in the practice of secret voting, which is hence generally called 'voting by ballot,' whether it be a ball or a ticket that is used. Votes may be taken by ballot in various ways: the voter may deposit a ball in either of two boxes, so conjoined that no one shall be able to say into which he drops it; or he may be presented with two balls—a white and a black—and so drop one of them into a box that it shall be unknown which he used. Voting by ballot, the common form in ancient Greece and Rome, is now the general method at elections in countries where constitutional government prevails, and is usually carried out by means of marked (but unsigned) papers or cards. The ballot was one of the first things demanded by English reformers at the beginning of the 19th century; it stood in the original draft of the Reform Bill of 1832; but it was not till the passing of Mr Forster's Ballot Act in 1872 that secret voting was introduced at all parliamentary and municipal elections, except parliamentary elections for universities. It was used in Maryport for Town and Harbour Trusts elections from 1838.

Ballou, HOSEA. See UNIVERSALISTS.

Ballycastle, a small seaport in the north of County Antrim, Ireland, on an open bay opposite Rathlin Isle, 68 miles N. of Belfast by rail. Its harbour and pier (now sanded up and ruined) cost £150,000. Coal was dug here 500 years ago. *Bally* represents the Irish *baile*, 'town.' Pop. 1500.

Ballymena, a small town of County Antrim, Ireland, on the Braid, 33 miles NNW. of Belfast by rail. It lies in a densely peopled and well-cultivated district, the inhabitants uniting the pursuit of agriculture with the manufacture of linen. Ballymena is a great linen and flax market, and its vicinity is covered with bleach-fields. Pop. 11,400.

Ballymoney, a market-town of County Antrim, Ireland, 53 miles NNW. of Belfast by rail, with a trade in linen; pop. 1550.

Ballymote, a town in County Sligo, 10 miles S. of Sligo; pop. 900.

Ballynahinch, a market-town of County Down, 12½ miles S. of Antrim; pop. 1700.

Ballyshannon, a seaport of County Donegal, the largest town of the county. It is at the mouth of the river Erne, on a small inlet running off from Donegal Bay, 157 miles NW. of Dublin by rail. There is a salmon-leap and a valuable salmon-fishery on the river. Pop. 2200.

Balm (*Melissa officinalis*), a fragrant perennial

Common Balm
(*Melissa officinalis*).

herb belonging to the order Labiatae, a native of the south of Europe and Western Asia, and naturalised in a few places in England, has long been cultivated in gardens. The stems and leaves are still occasionally used in medicine as a gentle stimulant and tonic, and were formerly in high repute. The taste is somewhat austere, and slightly aromatic. The quantity of essential oil, on which its whole qualities depend, is not more than sufficient to communicate a pleasant flavour to the infusion. — A variety of the common Cat-mint (*Nepeta cataria*), with a smell like that of balm, is often mistaken for it. — Moldavian Balm (*Dracocephalum moldavicum*) is a native of Eastern Europe, Siberia, &c. — Bastard Balm (*Melittis melisophyllum*), a native of the south of England and of many parts of Europe, is a

very beautiful plant, which when dried has a delightful fragrance, and retains it long. *Calamintha nepeta* is sometimes called Field-balm, while *Collinsonia* is termed Horse-balm in America. Balm-like properties are extremely common among the Labiatae (q.v.). The name is from the late Latin *balsamum*.

Balme, COL DE, a mountain pass between Mont Blanc and the Dent du Midi, over which goes the route from Martigny to Chamonix. The summit is 7200 feet high.

Balmerino, a small village of Fife, on the Firth of Tay, 3½ miles SW. of Dundee by water. Near it are scanty remains of a Cistercian abbey (1227), whose lands came into the possession of Sir James Elphinstone, created Lord Balmerino in 1604. The sixth and last lord (1688-1746) was beheaded on Tower Hill for his share in the '45. See J. Campbell's *History of Balmerino* (Edin. 1867; new ed. 1899).

Balm of Gilead. See BALSAM OF GILEAD.

Balmoral, a royal residence in Braemar, Aberdeenshire, 9 miles W. of Ballater, and 52½ of Aberdeen. Standing 926 feet above sea-level on a natural platform that slopes gently down from the base of Craig-gowan (1437 feet) to the margin of the river Dee, it commands a magnificent prospect on every side. In 1848 Prince Albert purchased the reversion of a 38 years' lease from the representatives of Sir Robert Gordon, who had held it under the Earl of Fife; and in 1852 he acquired the fee-simple of the estate from the Fife trustees for a sum of £32,000. The old castle not being sufficiently commodious for the royal family, Prince Albert erected a new one (1853-55) at a cost of £100,000 in the Scottish Baronial style of architecture. The castle consists of two separate blocks of building, united by wings, with a massive tower 35 feet square, rising to the height of 80 feet, and surmounted by a turret 20 feet higher. At a distance, the castle, which is built of granite, has a strong and imposing appearance, looking almost as if it had been hewn out of one huge rock of that material. The estate now includes Birkhall, Knock Castle ruins, and Loch Muick; and extending to the summit of Byron's 'dark Lochnagar,' it, with its deer-forest, comprises upwards of 25,000 acres.

Balnaves, HENRY, of Halhill, Scottish Reformer, was born at Kirkcaldy in Fife of poor parents, but was educated at St Andrews University and at Cologne. He acted for some time as a procurator at St Andrews; in 1538 James V. made him a Lord of Session; and in 1543 the regent Arran appointed him secretary of state. Shortly after, however, he suffered a six-months' imprisonment in Blackness Castle on account of his Protestantism; and in 1546, like Knox, he joined Beaton's murderers in the castle of St Andrews. When the castle was captured by the French (1547), Balnaves, with Knox and others, was sent to Rouen as a prisoner of war. While in prison here, he wrote a treatise on Justification, which, with notes and a preface by Knox, was published in 1584 as *The Confession of Faith*. In 1556 Balnaves' forfeiture was rescinded, and he returned to Scotland, and took an active part on the side of the Lords of the Congregation. In 1563 he was nominated a commissioner to revise *The Book of Discipline*. He died in 1579.

Balrampur, headquarters of the estate of the premier talukdar of Oudh; pop. of town, 14,000.

Balsam, a name formerly comprehending medicines compounded of resins and oils, as well as many resinous substances and oils, to which important medicinal virtues were ascribed. When the term balsam is now used without addition, the balsams of Peru and Tolu are generally intended. — These two balsams are very similar in all their more important properties, and are both produced by trees of the genus *Myroxylon*, of the natural order Leguminosæ, sub-order Papilionaceæ, natives of the tropical parts of America. *M. pereiræ*, the source of balsam of Peru, is a tree found in the state of San Salvador, in the district called Balsam Coast.

M. toluifera, a native of Venezuela, Ecuador, and Brazil, furnishes balsam of Tolu. After being bruised and charred, the bark of the former falls off, and balsam begins to exude. It is received on rags, which, when saturated, are boiled in water, the separated balsam falling to the bottom. It is a liquid, having the appearance of treacle, but rather less viscid. Balsam of Tolu is generally soft and tenacious when first imported, becoming hard by age. Both balsams have a very fragrant odour. They are used in confectionery, to impart a flavour like that of vanilla; also in perfumery, and for pastilles, &c. In medicine, they are administered as gentle stimulants and tonics, and particularly in chronic bronchial affections. *Tolu lozenges* are a popular and pleasant remedy for troublesome coughs. These balsams are also used for cleansing ulcers.—They contain cinnamic acid, and a peculiar oily substance which has been called *cinnameinc*, and is also known as Oil of Balsam of Peru. The name *White Balsam of Peru* is sometimes given to a balsamic substance which flows from the *Liquidambar styraciflua*. See LIQUIDAMBAR.

Balsam is also the common name of a genus of succulent herbaceous plants, of which the beautiful balsam (*Impatiens balsamina*), so much cultivated in gardens and greenhouses, is a familiar example. Up-

wards of one hundred species are known, natives chiefly of damp bushy places in the East Indies, and many of them plants of great beauty. They are almost all annuals, and have generally white or red flowers. The balsams are usually regarded as a sub-order of Geraniaceæ (see GERANIUM), of which they are simply the most differentiated type, but are distinguished by the extreme irregularity of the

Balsam (*Impatiens tricornis*).

flowers, which have been the subject of much controversy among morphologists, and also by the beakless fruit, which is a five-celled capsule, bursting by five elastic valves. The leaves are simple, and without stipules, the flowers generally axillary. The common balsam is a native of the East Indies and Japan. Many fine varieties, double as well as single, and of all varieties of colour and marking, have resulted from careful cultivation, and florists distinguish pyramidal, dwarf, and camellia-flowered races. It has an upright succulent stem, usually about 1-2 feet high, but in favourable circumstances will attain a greater size. In Britain, the seed is usually sown on a slight hotbed, and the plant is often kept in the greenhouse; although even in Scotland it may be made an ornament of a sheltered border. It is one of the flowers frequently to be seen in cottage-windows. A vulnerary was formerly prepared from it, whence it has its name. One species of balsam (*Impatiens noli-me-tangere*), called Yellow Balsam or Touch-me-not, is a native of Europe, and a doubtful native of Britain. It has yellow flowers,

and one of the petals prolonged into a spur. Its ripe capsules burst on the slightest touch, scattering the seed.

Balsam or **Balm of Gilead** is a liquid resinous substance, which has long enjoyed a very high reputation in the East for its fragrance and medicinal virtues. It is the subject of several allusions in the Old Testament, and is celebrated by Strabo, Pliny, Diodorus Siculus, and other ancient writers, almost as a cure for every disease. It is generally believed to be derived from a species of Balsamodendron (q.v.). The finest balsam, called Opobalsam, or Balm of Mecca, is of a golden yellow colour, and of a consistence like honey. Balm of Gilead is irritating when applied to the skin. Other substances sometimes designated balsams, and possessing a somewhat similar fragrance, are produced by different species of Amyridaceæ (q.v.). Among them is one called American Balm of Gilead, the produce of a tree called *Iceia Carana*.—Balsamic substances are furnished also by a number of species of Clusiaceæ.—Balsam of Umiri, a fragrant yellow fluid, by *Humirum floribundum*, a South American tree, of the natural order Humiraceæ.—Canada Balsam (q.v.) is a kind of turpentine obtained from the Balm of Gilead Fir (*Abies balsamea*); Hungarian Balsam, from the Mugho or Mountain Pine (*Pinus pumilio* or *Mughus*); and Carpathian Balsam, from the Stone Pine (*Pinus Cembra*). See FIR and PINE.—Balsam of Copaiva (q.v.) is the produce of different species of Copaifera. See EMBALMING.

Balsamoden'dron, or COMMIPHORA, a genus of small trees or bushes of the Burseraceæ. Some of them are spiny; they generally exhibit a scrubby appearance, and have little foliage, but are remarkable for the resins or balsams obtained from their wood and fruit—as Balsam of Gilead, Myrrh, Bdellium, and Elemi (see these articles). The known species are mostly natives of the East Indies, Arabia, and the east of Africa.

Balta, a town on the Kodema, an affluent of the Bug, in the government of Podolia, Ukraine. Tallow-melting, soap-boiling, and brewing are carried on. Pop. 25,000.

Baltchik. See BALTJIK.

Baltic, BATTLE OF THE. See COPENHAGEN.

Baltic Port, a seaport and railway terminus of north-west Esthonia.

Baltic Provinces, now States, include the former Russian governments of Courland, Livonia, and Esthonia; in a wider sense also Finland and the Russian government of Petrograd. The Baltic provinces once belonged to Sweden, except Courland, a dependency of Poland. They came into the possession of Russia partly through the conquests of Peter the Great, partly under Alexander in 1809. No pains were spared to Russianise them, and after 1876-77 they lost their remaining privileges, and were thoroughly incorporated in the Russian empire. They form a borderland between the Germanic and Slavonic areas, and have been a frequent cause of difficulty between Germany and Russia. The bulk of the people are Esths and Letts, with many Germans, but few Russians. After the Russian revolution of 1917, the independent republics of Finland, Esthonia, and Latvia, or Lettland (southern Livonia, Courland, and western Pskov), were set up. See also LITHUANIA.

Baltic Sea, bordered by Denmark, Germany, Poland, Lithuania, Lettland, Esthonia, Russia, Finland, and Sweden, communicates with the Kattegat and North Sea by the Sound and the Great and Little Belts. Its length is from 850 to 900 miles; breadth, from 100 to 200; and area, including the Gulfs of Bothnia and Finland, 184,496 sq. m., of which

12,753 are occupied by islands. Its mean depth is 44 fathoms, and the greatest ascertained depth, between Gottland and Courland, 140. Its shallowness and narrowness, its numerous islands and reefs, the shoal coasts of Prussia on the one side, and the rocky coasts of Sweden on the other, and above all, the numerous and sudden changes of wind accompanied by violent storms, make the navigation of the Baltic very dangerous. The group of the Aland Islands divides the south part of the sea from the north part or Gulf of Bothnia (q.v.). The Gulf of Finland (q.v.), branching off eastwards, separates Finland from Esthonia. A third gulf is that of Riga or Livonia. The Kurisch and other Haffs (q.v.) are not gulfs, but fresh-water lakes at the mouths of rivers.

The water of the Baltic is colder and clearer than that of the ocean, and contains only a fourth of the proportion of salt found in the Atlantic. Ice hinders the navigation of the Baltic from three to five months yearly. Rarely, as in 1658 and 1809, the whole surface is frozen over. Tides, as in all inland seas, are little perceptible—at Copenhagen, about a foot; yet the water rises and falls at times, though from other causes, chiefly from the varying quantity of water in the rivers at different seasons. Upwards of 250 rivers flow into this sea, which, through them and its lakes, drains rather less than one-fifth of all Europe, its drainage area being estimated by Dr W. B. Carpenter as 717,000 sq. m. The chief of these rivers are the Oder, Vistula, Niemen, Dwina, Narva, Neva; the waters of Lake Maaler, and those of Wetter and other lakes reach the sea through the river Motala. The principal islands are Zealand, Finen, Bornholm, Samsoe, and Laaland, belonging to Denmark; the Swedish islands Gottland, Oland, and Hveen (in the Sound); Rügen, to Prussia; and the Aland Islands, to Finland, claimed by Sweden. Timber, hides, tallow, and grain are the chief exports from the countries bordering on the Baltic. The number of vessels that pass the Sound to or from the Baltic annually is very large. See SOUND.

The Eider Canal, connecting the Baltic near Kiel with the North Sea at Tönningen, facilitated the grain trade in mild winters; and the two seas are also connected by the Gotha Canal, which joins the lakes of South Sweden. These being navigable for boats of light draught only,

Map showing the Baltic and North Sea Canal.

a great ship-canal from Brunsbüttel, at the mouth of the Elbe, to Holtenau, near Kiel, was constructed in 1887-95, designed for the largest vessels, especially German war-ships (see CANAL). Inaugurated with great ceremony in 1895, it is 61

miles long, and has since been deepened and widened, so that the depth is now 11 metres, with a width at bottom of 44 metres, at surface of 102 metres; and as the sea-voyage round from the Elbe to Kiel means nearly 600 miles of dangerous sailing, the canal is a great advantage. It is open to all nations alike. Harbours in the Baltic are: in Denmark, Copenhagen; in Germany, Kiel, Lübeck, Stralsund, Stettin, Königsberg, with Danzig and Memel under the League of Nations; in Latvia, Libau and Riga; in Esthonia, Reval and Narva; in Russia, Kronstadt; in Finland, Sveaborg; and in Sweden, Stockholm and Karlskrona.—The shores of Prussia and Courland have been long noted for the amber cast ashore in stormy weather. Another important phenomenon connected with the Baltic is a slow vertical movement of its coasts, *downwards* in the south of Sweden, but farther north *upwards*, being there supposed to be at the rate of 3 feet in a century. Its area is held to be gradually decreasing. The Germans call this sea *Ostsee*, or East Sea; the name Baltic first appears in the 11th century, in a work by Adam of Bremen.

Baltimore, named after the first Lord Baltimore (q.v.), is a port of entry and the largest city of Maryland. The sixth city of the United States in population, it stands on the northern bank of the river Patapsco, an arm of Chesapeake Bay, 180 miles by ship-channel from the ocean, 96 miles SW. of Philadelphia, and 40 NE. of Washington. Its site is uneven, and its surroundings are picturesque and pleasant. The plan of the streets is not so strictly uniform as in many American cities. The harbour is spacious and perfectly secure, having a minimum depth of 24 feet, and access from the sea is safe and easy. Baltimore is reached by numerous lines of railway connecting in a Grand Union Dépôt, and having several other stations in various parts of the city. It is an important centre of the traffic in bread-stuffs, which are largely received by rail and shipped at this point. Other leading articles of export are tobacco, provisions, coal, cotton, naval stores, canned fruits, and oysters. The imports include large amounts of guano, coffee and other tropical products, fertilisers, iron, steel, tin-plate, and chemicals. Baltimore is also the seat of extensive and varied manufactures, and in 1910 it ranked as the sixth city of the United States in the extent of its foreign trade. Its manufactured products include cotton and woollen goods; flour of superior quality, largely produced in Baltimore and vicinity; tobacco and cigars; glassware; boots and shoes; iron and steel, including machinery, car-wheels, iron bridges, stoves, furnaces, &c.; clothing, in the manufacture of which large capital is invested, producing goods to the value of about \$20,000,000 per annum; pianos, organs, &c. One of the principal industries of Baltimore is the canning of oysters, in which over 6500 hands are employed during the annual oyster season—several thousand vessels being engaged in the oyster-fishery. The canning of fruits and vegetables is also a large industry, estimated at nearly \$10,000,000 annually. Textiles rank high, 80 per cent. of all duck goods in the United States being produced there. Baltimore is the largest corn-exporting port in the country, and has also a large trade in copper, flour, leaf-tobacco, and other goods. In the first half of the 19th century the famous 'Baltimore clippers' greatly extended the trade of the city.

Baltimore is noted for the fine architecture of its public and other buildings, among the finest being the chamber of commerce, the Roman Catholic cathedral, the Maryland Institute, the city hall (with a dome 260 feet high), the beautiful white marble court-house, the masonic temple, and the Peabody Institute (see PEABODY). The public

monuments, of which five or more are noteworthy (the Washington column being 210 feet high), have given Baltimore the name of the 'monumental city.' There are several public squares and parks, the beautiful Druid Hill Park of nearly 700 acres, purchased by the city at a cost of about \$800,000, being the most celebrated. There are numerous churches, among which the Roman Catholic, the Protestant Episcopal, and the Methodist denominations are conspicuous. The educational institutions are many and important. The Johns Hopkins University, endowed with over \$3,500,000 by a Quaker philanthropist of that name (1795-1873), was opened in 1876, and already takes rank as one of the first seats of learning in the country. Among the institutions are the Baltimore City College, the academy of science, the law school, several medical schools, a dental school (the oldest in the world), Loyola College, St Mary's Seminary, and a state normal school; and there are complete systems of graded public and parochial schools. The city has a number of good libraries, of which the largest are the Enoch Pratt Free Library and the library of the Peabody Institute.

Baltimore is a place of much wealth and social refinement, and is noted as an art-centre. It is the seat of a Roman Catholic archbishop, who has the rank of primate of the United States, the see being the oldest in the country. The diocese of Baltimore was created in 1789; and the see became archiepiscopal in 1808. Dr John Carroll was the first bishop and archbishop. Owing to the fact that Maryland was originally settled to a great extent by members of the Roman Catholic Church (chiefly of English birth), that church and its adherents have always had a greater social influence in Baltimore than in most American cities of its size. Baltimore is also the seat of a bishop of the Protestant Episcopal Church. The population of the city is of various origin. Less than one-sixth of the people in 1910 were of African descent, and about one-sixth were of foreign birth. Among the native-born population of the city there is a rather large element of German descent, and many Irish and French creole families were among the earlier settlers. In colonial days, the English Puritans, and later, the Scotch-Irish Presbyterians, were here numerous. Of the present inhabitants, a considerable proportion have been born in states lying farther north than Maryland.

Founded in 1729, the city was named in honour of Lord Baltimore, the founder of the Maryland colony, and in 1796 was incorporated as a city. It very early became noted for its commerce and ship-building. It was the scene of important events during the war of 1812-15, and in the early part of the Civil War of 1861-65, and of a destructive conflagration in 1904, which spread through the business centre of the city. Pop. (1790) 13,503; (1830) 80,625; (1860) 212,218; (1880) 332,313; (1910) 558,485; (1920) 733,826.

Baltimore is a small fishing-village in County Cork, on Baltimore Bay, 7 miles SW. of Skibbereen. Here was established in 1887, by the Baroness Burdett-Coutts, a technical school for giving instruction in all that pertains to fishing, sail-making, net-making, &c. Pop. 450.

Baltimore, GEORGE CALVERT, first LORD, born at Kipling, in Yorkshire, about 1580, entered parliament in 1609, was knighted in 1617, and in 1619 became Secretary of State. In 1625 he declared himself a Catholic, and resigning his office, received the rank of Baron Baltimore in the Irish peerage. His Irish estates were at the same time confirmed to him, and thither he retired. As early as 1621, Calvert had despatched colonists to a

small settlement in Newfoundland, and in 1627 he visited the place. In the following spring he returned with his family, and stayed till the autumn of 1629. The severe winter induced him to sail southward in search of a more genial country; but his attempts to settle in Virginia led to disputes, and he returned home to obtain a fresh charter. He died, April 15, 1632, before the completion of the patent, which was granted in June to his son, Cecil, second Lord Baltimore. See MARYLAND, and Life by Neill (Balt. 1869).

Baltimore Bird or **Oriole** (*Icterus Baltimore*), a finch-like perching bird, very common in North America from Canada to Mexico. The males arrive from the south about the beginning of May, and are soon followed by the females. They settle near houses on tulip-trees, pea-vines, and the like, and build a beautiful hanging nest of skilfully interwoven moss and fibres. The name 'hang-nest' obviously refers to this habit. They levy contributions from any loose soft material that may come handy, such as the hairs of horses and cattle, the thread laid out for bleaching, or the strings wound round the fruit-tree grafts. The

Baltimore Oriole.

pendulous pouch measures 6 or 7 inches in length, and varies somewhat according to the climate. The bird itself is somewhat smaller than a starling, measuring about 7 inches in length, with sharp conical bill longer than the head, long pointed wings, and medium-sized rounded tail. The plumage is very gay, especially in the males, glossy black, finely contrasting with bright orange and vermillion. Orange and black were the colours of Lord Baltimore's livery, hence the name Baltimore Bird. Another of its many aliases, 'fire-bird,' describes its bright flashing appearance among the branches. The song is powerful and pleasing, and is peculiarly mellow during the love-season. These birds are gregarious, and while they do some damage by plundering pea-pods and other fruits, more than compensate for their thefts by their destruction of orchard insects like the cankerworm and tent-caterpillars. They are quick and lively in their habits, and make courageous parents. The genus *Icterus* must be distinguished from the true Orioles (q.v.). See Baird, Brewer, and Ridgway, *North-American Birds*.

Baltistan, or **LITTLE TIBET**, is an alpine region through which the Upper Indus flows. It lies below the Kara-Korum Mountains and the Himalayas, with a mean elevation of 11,000 feet, and contains Mt. Godwin-Austen (K²), 28,278 feet high, next to Everest the highest on the globe,

It is politically a part of Kashmir, and the inhabitants are of Mongolian stock.

Baltjik, a seaport of Rumania, on the shore of the Black Sea, 20 miles N.E. of Varna. Near it are the ruins of Tomi, whither Ovid was exiled. It was ceded by Bulgaria in 1913. Pop. 6000.

Baluchistan. See BELUCHISTAN.

Balzac, HONORE DE, was born at Tours on the 20th May 1799. He was educated at the Collège de Vendôme and studied law at the Sorbonne. In opposition to his father's wish that he should become a notary, he left Tours in 1819 to seek his fortune as an author in Paris. From 1819 to 1830 he led a life of frequent privation and incessant industry, producing stories which neither found nor deserved to find readers, and incurring—mainly through unlucky business speculations—a heavy burden of debt, which harassed him to the end of his career. He first tasted success in his thirtieth year on the publication of *Les Derniers Chouans*, which was soon afterwards followed by *La Peau de Chagrin*, a marvellous interweaving of the supernatural into modern life, and the earliest of his great works. After writing several other novels, he formed the design of presenting in the *Comédie Humaine* a complete picture of modern civilisation. All ranks, professions, arts, trades, all phases of manners in town and country, were to be represented in his imaginary system of things. In attempting to carry out this impossible design, he produced what is almost in itself a literature. The stories composing the *Comédie Humaine* are classified as 'Scènes de la Vie Privée, de la Vie Parisienne, de la Vie Politique, de la Vie Militaire,' &c. They are connected by a web of intrigue which has the Paris of the Restoration for its centre, but which stretches its threads over the provinces. Each of the actors in the brilliant crowded drama is minutely described and clothed with individuality, while the scenes in which they move are set forth with a picturesqueness and verisimilitude hardly to be matched in fiction. Among the masterpieces which form part of Balzac's vast scheme may be mentioned *La Recherche de l'Absolu*, *Le Père Goriot*, *Les Illusions Perdues*, *Les Paysans*, *Les Marana*, *La Femme de trente Ans*, *Les Parents Pauvres*, and *Eugénie Grandet*. The *Contes Drôlatiques* (1833) stand by themselves. They are a series of gross stories in the vein of Rabelais, Balzac reproducing with masterly skill the French of the 16th century. Balzac's industry was amazing; according to his own account, he not infrequently worked for fifteen and even eighteen hours a day. He wrote eighty-five novels in twenty years, though he was not a ready writer; and though he was no 'stylist' in the sense that Flaubert was to a typical extent, he expended enormous labour on his proof-sheets. His work did not bring him wealth; his yearly income, even when he was at the height of his fame, is said to have rarely exceeded 12,000 francs. During his later years he lived principally in his villa, Les Jardies, at Sèvres. In 1849, when his health had broken down, he travelled to Poland to visit Madame Hanska, a rich Polish lady, with whom he had corresponded for more than fifteen years. In 1850 she became his wife, and three months after the marriage, in August of the same year, Balzac died at Paris. His influence on literature has been deep and many-sided, and novelists with so little in common as Feuillet and Zola alike claim him for their master. He studied character and the machinery of society in a scientific spirit, but he was not content with the photographic reproduction of fact. He was a visionary as well as an analyst, an idealist and a realist in one. The materials acquired by study were shaped and coloured by his

fiery and teeming imagination. In the *Comédie Humaine* we see the everyday world reflected in a magic mirror, where the lights are brighter, the shadows darker; where objects stand out in sharper relief, and are sometimes oddly distorted. He strenuously exaggerates in the delineation of character. 'Every one in Balzac,' says Baudelaire, 'down to the very scullions, has genius.' His work bears trace of the strain with which it was produced; it is often coarse, often extravagant, occasionally dull. But few writers give such an impression of intellectual force.

His works were published in 25 vols. (1869-75); with a supplemental *Histoire des Œuvres*, by Lovenjoul (1879), who wrote *Around Balzac* in 1897. In 1912 an edition of the *Œuvres Complètes* in 40 vols. began to appear. See also the Life by his sister (1858); Le Breton, *Balzac, l'Homme et l'Œuvre* (1905); Brunetière, *Honoré de Balzac* (trans. 1907); books on him by Wedmore (1900), Miss Worneley (1892), Sanders (1905), Lawton (1910), and Faguet (1913); Saintsbury's Preface to the translation of *La Peau de Chagrin* (1895), and Henry James's to *The Two Brudes*. He was described as a 'fat man, short and vulgar;' neither warm-hearted nor sympathetic, but of enormous vitality. Turgeneff found him so unsympathetic as to be unreadable. The 'de' in his name was factitious; his father's father was a day-labourer in Languedoc.

Balzac, JEAN LOUIS GUEZ DE, born at Angoulême in 1594, in his youth was secretary to Cardinal la Valette at Rome, and on his return to Paris devoted himself to the refinement of his native language. His writings heralded the splendid phalanx of genius which adorned the subsequent age of Louis XIV. He was a favourite of Cardinal Richelieu, a member of the French Academy, a councillor of state, and historiographer. His violent literary disputes with Father Goula caused him to leave Paris and retire to his hereditary property of Balzac, where he died on the 18th February 1654. His collected works were edited by the Abbé Cassaigne (1665); selections, by Malitourne (1822), and Moreau (1854). Of all his works, his *Lettres* (1806) and *Lettres Inédites* (1874) are most admired.

Bambarra, one of the Sudan states of Western Africa, lying (where 5° W. long. and 12° N. lat. cross one another) on both sides of the Upper Niger. In the east, the country is flat and swampy; but in the west there are low chains of granite hills. The climate in some parts is intensely hot, but is generally healthy. The land is well watered and fertile. The inhabitants, a branch of the Mandingoes, number about 2,000,000, and are superior to their neighbours in intelligence. The upper classes profess Mohammedanism, but the lower are pagans. The principal towns are Sego, Sansanding, Yamina, and Bamako. Many local merchants are very wealthy, and a pretty extensive trade is carried on, the natives working articles in gold, ivory, and iron. In 1899 it was incorporated with the French Sudan, called till 1920 Upper Senegal-Niger.

Bamberg, a Bavarian city, in Upper Franconia, beautifully situated on the banks of the Regnitz, 3 miles above its confluence with the Main, and 33 N. of Nuremberg by rail. Set in the midst of vineyards, orchards, and hop-gardens, and founded about 769, from 1007 to 1802 it was the seat of independent prince-bishops. The most noteworthy of its fourteen churches is the cathedral, a magnificent edifice in the Romanesque style, founded by the Emperor Henry II. in 1004, and thoroughly restored in 1828-37. It has five towers, and contains, among other monuments, the elaborately carved tomb of the founder and his empress, Cunigunda. There are several other fine ecclesiastical structures of early

date, and opposite the cathedral is the palace (1702) of the former prince-bishops, from one of whose windows Marshal Berthier (q.v.) met his death. St Michael's Benedictine abbey (1009) was in 1803 converted into an almshouse. The ruins of the castle of Altenburg, originally the seat of the Counts of Babenberg, stand on an eminence $1\frac{1}{2}$ miles from the town. Pop. in 1919 close on 50,000. The beer is famous; cottons and woollens are manufactured, also leather, gloves, tobacco, sugar, and musical instruments.

Bamberger, LUDWIG (1823-99), born at Mainz of Jewish parentage and bred a lawyer, was a revolutionary in 1849, and after 1870 was a conspicuous representative in the Reichstag of the National Liberal and Free-trade Party. He opposed Bismarck and the government colonial policy.

Bambi'no (Ital., 'babe'), a term in art descriptive of the swaddled figure of the infant Saviour. The *Santissimo Bambino*, in the church of the Ara Coeli at Rome, is held in great veneration for its supposed miraculous power of curing the sick. It is carved in wood, painted, and richly decorated with jewels and precious stones.

Bamboo' (*Bambusa*), a genus of grasses, of which most of the species attain a great size, many of them 20 or 30 feet, some 70 or 100 feet in height. The species are numerous, and are found in tropical and subtropical regions, both of the eastern and western hemispheres. Some of the species grow to the height of only a few feet; and almost all of them are slender in proportion to their height, although *B. guada* has often a trunk 16 inches in diameter. All of them have a jointed subterranean root-stock (rhizome), which throws

creeping stems. The stems grow to their full height unbranched, but afterwards throw out straight horizontal branches, especially in their upper parts, forming a dense thicket; some of the smaller kinds are often planted as hedges. The stems are jointed like those of other grasses, very hard, but light, elastic, and hollow, containing only a light spongy pith, except at the joints or nodes, where they are divided by strong partitions. The stems of different species vary also very much in the thickness of the woody part, and so in their adaptation to different purposes. In China and Japan is found a bamboo the stem of which, instead of being cylindrical like that of other bamboos and all grasses, is square. At three years old, this stem is one inch in section each way (see *Nature*, vol. xxxii.). The *harry* bamboo is one of the most useful in China. The external covering of the stem is, in all the species, remarkably siliceous; the stem of *B. tabacaria* is so hard that it strikes fire when the hatchet is applied. There is perhaps scarcely any plant that serves such a variety of domestic and economical purposes. It would be difficult to point out an object in which strength and elasticity are required, and for which lightness is no objection, to which the stems of the different species are not applied. In the whole of the East, particularly in India, China, and Japan, in Jamaica and other parts of the West Indies, and some parts of South America, it forms almost the sole material of which the houses of the poor are built. It is employed for water-pipes, for which purpose its hollow stems (after the partitions at the joints are removed) render it eminently well fitted. It is used in the building of bridges, in the manufacture of furniture, ladders, masts for boats, rails, fences, spear-shafts, domestic utensils, and agricultural implements. The stems are also split up finely and worked into mats, and ropes, and even into the sails of boats. From both the external and internal pellicles of the stems an excellent paper is made by bruising and steeping it in water till it becomes a paste. Large quantities of bamboo cane are imported to Europe for various purposes, such as the making of walking-sticks, stakes for flowers and the training of fruit-trees in nurseries, and the manufacture of wicker-work. The leaves of some kinds are used as thatch in the making of hats and mats; those mats seen enfolding chests of tea being made of the leaves of one species cultivated by the Chinese for that purpose. The shoots, when young and tender, are eaten in the same way as asparagus, or boiled with milk, or made into broth with the addition of animal food, spices, and salt; also along with the young root-stocks they are pickled in vinegar wherever they abound in the East, and are imported into Europe as an eastern condiment under the name *Achiar* or *Achar*. The pith of some species is sugary, and at certain seasons a saccharine juice exudes from it at the joints, which becomes concrete on exposure to sun and air, and is used for domestic and economic purposes in India. This substance is called *Indian Honey*, and is erroneously also sometimes named *Tabaris* or *Tabasheer*, a name which properly belongs to another and very remarkable substance produced in the hollow internodes of the stems of some of the species (see *TABASHEER*). The seeds of some species are used as rice, and for making a kind of beer. Bamboos are generally of very rapid growth, and they are often found in arid situations, which would otherwise be destitute of vegetation. *B. guada* and *B. latifolia*, both natives of South America, have the internodes of the stems filled with clear fluid of an agreeable taste, which, though containing slight traces of sulphates and chlorides, can scarcely be distinguished from pure spring-water. It is not improbable that they may yet be

Bambusa falcata :

a, upper portion of the stem, with foliage; b, root-stem; c, section of stem.

up 10-100 stems. These are generally straight and erect; although one large species (*B. agrestis*), common in dry mountainous situations in the south-east of Asia, has crooked, and sometimes

employed, where they do not naturally abound, to render districts productive which are now little else than deserts, in climates like those of Arabia, the north of Africa, and Australia; and the quality of the grain of different species seems to deserve more attention than it has yet received. The species common in the West Indies (*B. vulgaris*) is supposed to have been introduced from the East Indies. A few species are found in the Himalaya, to an altitude of 12,000 feet, and a dwarf species from that region has been successfully tried in the open air in England. See JUNGLE.

Bambouk, or BAMBUK, a country of French Sudan, lying in the angle formed by the Senegal and Faleme rivers. The climate is unhealthy, especially during the rainy season; but the valleys are remarkable for their fertility. Trees common to Western Africa here attain enormous proportions. Vast herds of wild oxen roam the hills, and most of the wild animals of Africa abound. Bambouk has rich iron ore and deposits of gold in its rivers, especially the Faleme. Fatanaba and Mandinka are the chief towns. The inhabitants, the Mandingoes, are professedly Mohammedans, but they cling to many pagan superstitions, and are very ferocious.

Bamburgh, the site of an ancient fortress on the coast of Northumberland, 5 miles E. of Belford, and 16½ SE. of Berwick. It crowns a basaltic rock 150 feet high, and accessible only on the SE. side. The best authorities agree that it was founded about 547 by Ida, first king of Bernicia, and later named *Bebbanburh*, after Bebbe, the queen of Æthelfrith, his grandson. In 642 it was unsuccessfully besieged by Penda, the heathen king of Mercia; and during the Danish descents on England it twice was partly demolished. Robert de Moubray, the rebellious Earl of Northumberland, having fallen into the hands of William Rufus in 1095, his countess surrendered the stronghold under the threat of seeing his eyes seared out. When Northumberland was granted to Henry, son of David I of Scotland, Bamburgh Castle was reserved for the English crown, and here Baliol acknowledged Edward I.'s supremacy in 1296. During the Wars of the Roses it was the scene of several conflicts, and was so battered and destroyed that it has not again been used as a fortress. In the reign of Elizabeth, its governor was Sir John Forster, and it continued in his family till Tom Forster forfeited it for his share in the '15, as is finely told in Besant's romance. Lord Creve, Bishop of Durham, then bought it, with the Forster estates, and bequeathed it in 1721 to trustees for benevolent purposes. The restoration of the castle, and its conversion to charitable uses, were chiefly carried out by the Rev. Dr John Sharpe; its income (about £9000) being expended in providing a dispensary; funds for maintaining, educating, and starting in life poor children; appliances for the rescue of shipwrecked sailors; the repair of churches; and aiding young men at the universities. In 1894 it was purchased from the trustees by Lord Armstrong, and endowed as an almshouse. Bamburgh village, near the castle, was a royal borough before the Conquest, and in the time of Edward I. returned two members to parliament. Grace Darling (q.v.) is buried in the churchyard. See Freeman's *English Towns and Districts* (1883); and vol. i. of the *History of Northumberland* (1893).

Bamian is a mountain-valley in Afghanistan, on the chief road between Kabul and Turkestan, and near the northern base of the Koh-i-baba range (see map at AFGHANISTAN). The valley itself lies 8500 feet above sea-level. The stream that drains it ultimately finds its way to the Oxus. The inhabitants are Hazaras. The most notable feature of

the district is a number of human figures of enormous size carved in the conglomerate rocks, from 200 to 300 feet high, which form the northern side of the valley. Of these there are five in all; and the

The largest of the Figures at Bamian.

two principal were described by the Chinese Buddhist monk, Hwen Tshang, who visited the valley about 630 A.D. By recent careful measurement, it appears that the largest is 173 feet high, or 3 feet higher than the Nelson Monument in Trafalgar Square; the second is 120 feet; the others are about 50 and 30 feet. The figures are solidly carved in niches in the rock, but the drapery and finishing are in stucco; and they have been much damaged by cannon shot, said to be those of the army of Nadir Shah. The two larger figures are usually regarded as male and female; but it is certain that Hwen Tshang was right in regarding them both as figures of Buddha; in the Chinese traveller's time there was a large Buddhist settlement here, with 10 convents and 1000 monks, and Bamian was a 'royal city.' That the figures are the work of Buddhist artists from India seems almost certain from their style of art, as also from the pictures with which the niches in which they stand have been covered. Stairs cut in the rock enable visitors to climb to the head of the figures. About two miles east of Bamian there seems to have existed a stupendous recumbent figure '1000 feet in length,' representing Buddha entering Nirvana (see BUDDHISM); as modern travellers do not mention it, it was probably composed of rubble plastered over, and so has disappeared.

The rocks are further full of caves, the great majority of which are occupied at the present day. These caves have curious domed roofs, and are covered with pictures in the same style of art as the niches containing the statues. The caves are dug out of the rock at various heights. There is now no town of Bamian, but there are a few small villages scattered up and down the valley. See an article in the *Journal of the Royal Asiatic Society* (1886) by Captain Talbot, with notes and sketches by Captain Maitland.

Bammako. See BAMBARRA.

Bampton Lectures, a series so called after the name of their founder, the Rev. John Bampton, a minor canon of Salisbury, who at his death in 1751 left £120 per annum to the university of Oxford, for the endowment of eight divinity-lecture sermons, to be preached at Great St Mary's every year, and to be published, at the expense of the

estate, within two months of their delivery. The lectures are directed to be upon the following subjects: 'to confirm and establish the Christian faith, and to confute all heretics and schismatics; upon the divine authority of the holy Scriptures—upon the authority of the writings of the primitive Fathers as to the faith and practice of the primitive Church—upon the divinity of our Lord and Saviour Jesus Christ—upon the divinity of the Holy Ghost—upon the articles of the Christian Faith as comprehended in the Apostles' and Nicene Creeds.' Only men who have taken the degree of M.A., either at Oxford or Cambridge, are qualified for election, and the same person shall never be chosen twice. The first course was delivered in 1780, since when, with the exception of the years 1834, 1835, and 1841, there has been an unbroken series of very valuable, but rather learned than popular discourses. None of these have caused such controversy as the lectures delivered by Dr Hampden (q.v.) in 1832, on 'The Scholastic Philosophy considered in its Relation to Christian Theology,' which were attacked on all sides, their author being accused of Rationalism and Socinianism. Other more eminent lecturers have been Heber (1815), Whately (1822), Milman (1827), and Hoine (1828). The course delivered by Dean Mansel (q.v.) in 1858, on 'The Limits of Religious Thought,' also gave rise to much discussion. Since then, Liddon (1886) on Christ's Divinity, Hatch on early Christian organisation (1880), Bigg on the Christian Platonists of Alexandria (1886), Cheyne on the Psalter (1889), Gore on the Incarnation (1891), Sanday on Inspiration (1893), and Illingworth on Personality (1894) have been among the most important. The similar Hulsean Lectures (q.v.) at Cambridge are treated elsewhere.

Ban, a Persian title meaning 'lord,' 'master,' or 'keeper,' and brought into Europe by the Avars. Formerly, it was bestowed on some of the military chiefs who guarded the eastern boundaries of the Hungarian kingdom, and was therefore synonymous with the German *Markgraf*. The ban, who was appointed by the sovereign, but not for life, and whose appointment had to be ratified by the national diet, had originally very extensive powers. In political, judicial, and military affairs, he was the supreme authority within his *Banat*. The most important banats were those of Dalmatia, Croatia, Slavonia, Bosnia, Machow, and Szoreny, afterwards formed into the double banat of Dalmatia and Croatia. In 1849, Croatia, Slavonia, and Dalmatia were transformed into Austrian crownlands, and the ban made wholly independent of Hungary; but in 1868 Croatia and Slavonia were reunited with Hungary, with a special local administration for internal affairs, the head of which was called the Ban. Most of these regions fell to Yugoslavia after the great European war. See BANAT.

Ban, a word occurring in most of the modern languages of Europe, and primarily signifying 'to proclaim' or 'publish.' This meaning it retains in *Banns* (q.v.) of marriage. In French military language, *ban* is the part of the population first liable to be called out in case of war; the *arrière-ban* is the reserve. In Germany, the *acht* or *ban-num* was a sentence of outlawry pronounced in the middle ages against those who escaped from justice, or refused to submit to trial. We often read of refractory princes, and even cities, being placed under the *ban of the empire*. When a grant of land was made for a religious purpose, or when a charter of liberties was granted, the transaction was proclaimed in public with certain ceremonies, and curses were denounced against any one who should violate the deed. Thus *banning*, or publishing,

came to be associated with cursing; and hence the origin of the popular use of the word. It occurs in this sense in Shakespeare and Milton, and other old writers.

Bana'na, the fruit of *Musa sapientium*, a herbaceous plant of arboreal proportions and palm-like aspect, belonging to the natural order Musaceæ. It is believed to have been originally

Musa paradisiaca:
a, fruit

of the East Indies, but is now found, along with the plantain, distributed and cultivated by man throughout the tropical and subtropical regions of the globe. The banana and the plantain were formerly regarded as distinct species, the latter being named *M. paradisiaca*, but there is no real specific distinction between the two forms. The varieties are very numerous, and run into each other by almost imperceptible gradations, while on the same bunch have been found growing fruits as diverse in form and other qualities as the distinct types commonly known as banana and plantain. To the large-fruited group is often ascribed the more farinaceous quality usually associated with the plantain, and to the small-fruited group the highly saccharine character of the banana.

This distinction can hardly be maintained as constant. Though really herbs, the bananas assume all the appearance of trees. Their stems, formed merely of the sheathing bases of the stalks of the large palm-like leaves, are soft, spongy, and destitute of woody structure, yet attain, according to the different species, the height of from 5 to 25 feet. In the tropics the stems are annual—that is, they die after perfecting the fruit, and fresh stems are developed from buds in the root-stock, which is perennial. These stems, or rather buds, furnish the common means of propagating and making fresh plantations, and the growth is so rapid that the fruit is usually ripe within ten months of the time of planting the offsets. When full grown, the stem is surmounted by a crown of large leaves, 6 to 10 feet long by 2 to 3 feet broad, the blade resembling the blade of an oar, with a strong fleshy foot-stalk and mid-rib. The flowers spring in great spikes from the centre of the crown of leaves, and are arranged in whorl-like clusters along the spike; the female flowers occupying the base of the spike, and the male the apex. The fruits are variously formed, some being angular, others cylindrical or even spherical, and vary in length from 4 to 12

inches, and in diameter from 1 to 1½ inches. The average weight of a bunch is about 25 lb., but individual bunches often exceed 40 lb.

It is one of the principal sources of food in tropical countries, taking the place of the cereals of more temperate climates. Its productive powers are prodigious; per imperial acre, it was estimated by Humboldt to produce 44 times more by weight than the potato, and 133 times more than wheat. It is stated that the fresh core of the fruit yields about 40 per cent. of dry meal. The more mealy kinds are never eaten raw except when ripe, but in all its unripe stages it is boiled and eaten as a vegetable. It is roasted also and flavoured with the juice of orange or lemon and sugar, and made into compotes; dried in ovens or in the sun, with the addition of spices and sugar, it is formed into a paste that will keep in a perfect condition for years. In South America, besides forming an indispensable article of diet in its fresh state, it is also an important article of internal trade in the shape of flour. The sugary or luscious kinds are used also in a variety of ways, and preserved by drying. By fermentation it yields a wholesome wine.

The banana is in many other ways useful to man. The stem yields a juice that is employed as an astringent, and its spongy pith, when pounded and boiled, forms a tolerably nutritious food of a starchy character. In Tonquin the stems are burned, and the ash used in purifying sugar. All parts of the plant abound in fibre which is believed to be well adapted to the manufacture of cordage and paper, but has never been systematically utilised, except in the most limited manner. The inhabitants of Dacca make from it the string of the bow with which they tease cotton, and in some of the islands of the Indian Ocean cloth is made from it. The top of the stem is boiled and eaten as a vegetable, and the leaves are used in packing, and for many domestic purposes.

There are many other species of *Musa*, the most notable of those besides the banana having edible fruit being *M. Cavendishii*, a very dwarf form, largely cultivated in China; the fruit having similar qualities to the typical form of plantain—i.e. farinaceous rather than saccharine. It is not uncommon in hothouses in this country, being easily cultivated. *M. textilis* (Abaca, q.v.) is the plant that yields the valuable fibre known under the name of Manila Hemp, a product of the Philippine and neighbouring islands. The finer qualities of this fibre are worked into delicate fabrics, so extremely fine that many yards may be inclosed in the hollow of the hand. *M. troglodytarum*, remarkable for bearing its clusters of fruit erect (not pendent as in the other edible species), furnishes food to the natives of the Moluccas, where the plant grows wild. *M. Ensete*, a native of Abyssinia, does not yield edible fruit, but the stem, before it becomes hard and fibrous, is an excellent esculent. Bruce says: 'When soft, like a turnip well boiled, if eaten with milk or butter, it is the best of all food, wholesome, nourishing, and easily digested.'

Banaras. See BENARES.

Banas ('hope of the forest'), the name of three rivers of India.—(1) A river of Rajputana, rising in the Aravalli Mountains, flows NE. through Mewar for 120 miles, then SE., and falls into the Chambal, after a total course of 300 miles.—(2) A river which also rises in the Aravalli Mountains, and after a south-westward course of 170 miles, is lost in the Rann of Cutch.—(3) A river of the Central Provinces and Central India, runs north-west for about 70 miles to the Son.

Banat, any district or territory under a Ban (q.v.), but specially applied after 1718 to a part of

Hungary which had no separate *ban* or governor. Bounded W. by the Theiss, S. by the Danube, and N. by the Maros, it consisted of the three counties of Temesvár, Torontál, and Krassova. It is partly mountainous and partly flat, is swampy and unhealthy in the west, but is eminently fertile and productive, yielding rich crops of wheat and other grain. The mines are valuable. The principal town is Temesvár. It was formed into an Austrian crown-land in 1849, but was incorporated with Hungary in 1860. After the great European war the mountainous part fell to Rumania, the flat to Yugoslavia.

Banbridge, a town in County Down, Ireland, on a steep slope on the left bank of the Bann, 76 miles N. of Dublin. It is a thriving seat of the linen manufacture in all its stages. Miles of bleaching-grounds exist in the vicinity, and numerous factories along the Bann. Pop. 5100.

Banbury, a small town of Oxfordshire, on the Oxford Canal and the Cherwell, 23 miles N. of Oxford, and 78 NW. of London by rail. Its strong castle, built about 1125, was demolished during the Great Rebellion, when Banbury was noted for Puritanical zeal. In 1469 the Yorkists were defeated in the vicinity. The town is still famous for its cakes and ale, as in Ben Jonson's day; and its manufactures webbing and agricultural implements. Among the buildings are the parish church (1797) and the town-hall (1854). Till 1885 Banbury returned a member; and it is now a municipal borough, with 13,000 inhabitants (a third of them in the town proper).

Banc, legally a seat or bench of justice, has in this sense given rise to the expression of the English courts of common law 'sitting in banc,' or *in banco*—sitting together on the bench of their respective courts. Since 1873 two or more judges sitting together are called a Divisional Court.

Banca (*Banka* or *Bangka*), an island 157 miles long, 8 to 20 broad, separated from Sumatra to the NW. by the Strait of Banca. With a few contiguous islands it forms the Dutch Residency of Banca, with an area of about 4500 sq. m., and a pop. estimated in 1910 at 115,000, of whom 50,000 were Chinese. The surface is for the most part level or undulating, but the island is by no means fertile, the banana and the durian being its only fruits. Gold, iron ore, silver, lead, and amber are found, but tin is the chief mineral. The tin-mines (over a hundred) are a government monopoly. The once dense forests have been terribly thinned for smelting purposes. The principal imports are rice, salt, and European goods. The capital, Muntok, in the north-west part of the island, has a fort and 3000 inhabitants.

Banco (It.), a commercial term meaning the standard money in which a bank keeps its accounts, as distinguished from the current money of the place. The distinction was more necessary when the currency was depreciated, or when it consisted, as it often did, of clipped, worn, and foreign coins. These the early banks (Venice, Amsterdam, &c.) received at their intrinsic worth, and credited the depositor in their books with this bank-value. The term was chiefly applied to the money in which the Hamburg bank kept its accounts, before the adoption of the new universal coinage of the German empire. It was not represented by any coinage. See also BANC.

Bancroft, GEORGE, principally distinguished as the author of the history of his country, but not without note as a diplomatist, was born in Worcester, Massachusetts, October 3, 1800, son of the Rev. Aaron Bancroft, author of a *Life of Washington*. At thirteen he entered Harvard

College, graduated with high honours in 1817, and spent two years in study at Gottingen, Germany, where in 1820 he received the degree of Doctor of Philosophy. Returning to America in 1822, he served a year as Greek tutor in Harvard College when he and Dr Cogswell, a fellow-tutor, established the Round Hill School at Northampton, Massachusetts, with which Bancroft was associated until 1830. In 1823 he published a volume of poems, and subsequently made translations from the German of the minor poems of Goethe, Schiller, &c., and of some of the historic-political works of Heeren. In 1834 appeared the first volume of his *History of the United States from the Discovery of the Continent*; followed by the second and third volumes in 1837 and 1840 respectively—the whole embracing *The History of the Colonisation of the United States*. These were succeeded in the interval from 1852 to 1860 by five volumes narrating the history of the colonial period to the Declaration of Independence, and in 1866 and 1874 respectively by the two concluding volumes, bringing the history to the treaty of peace with the mother-country in 1782. Bancroft subsequently published *The History of the Formation of the Constitution of the United States* (2 vols. 1882), which afterwards formed a constituent part of the revised edition of the complete *History of the United States*, embraced in six volumes (1882-84). In his political sentiments, Bancroft in early life was a democrat. He served as collector of the port of Boston (1838-41), under President Van Buren, and was an unsuccessful candidate for the governorship of Massachusetts in 1844. He accepted a seat in the cabinet of President Polk as secretary of the Navy in 1845, and the following year was appointed minister to the court of St James, a position which he filled until 1849, with honour to his country. A period of retirement from public life followed his return to America. In the civil war he was heartily in accord with the national government, and in 1867 he was appointed by President Johnson minister to Berlin, serving with distinguished ability until recalled at his own request in 1874. He afterwards lived in Washington till his death on 17th January 1891. See *Life and Letters* by De Wolfe Howe (1908).

Bancroft, HUBERT HOWE (1832-1918), North American historian, born at Granville, Ohio, settled at San Francisco in 1852, where he started a bookshop, and soon amassed a large fortune. He formed at a vast expense, and gave to the university of California, a library of 60,000 volumes, mainly on old American history and ethnography. A part of the books collected for Maximilian of Mexico came into his possession. One result of his studies is *The Native Races of the Pacific States* (5 vols. New York, 1875-76), forming the first portion of his colossal undertaking, a *History of the Pacific States of North America* (40 vols. 1882 *et seq.*). Other works are *Chronicles of the Builders of the Commonwealth* (7 vols. 1891-95), and a book on Mexico (1894).

Bancroft, RICHARD, Archbishop of Canterbury, and a bitter opponent of the Puritans, was born at Farnworth, Lancashire, in 1544. Sent to Cambridge by his uncle, Hugh Curwen, Archbishop of Dublin, he took his B.A. in 1567, and in 1576 became rector of Teversham, Cambridgeshire. Other preferments followed in rapid succession, until in 1597 he was consecrated Bishop of London. He attended Elizabeth during her last illness; and at the famous Hampton Court Conference under James I., he was one of the chief commissioners on behalf of the Church of England. Archbishop of Canterbury from 1604, he died 2d November 1610. He strove to make the Catholics faithful to the crown by cherishing the secular clergy as against the Jesuits (see **ARCHPRIEST**);

and by taking sides with the Puritans made possible the reconstruction of the church. See R. S. Usher, *The Reconstruction of the English Church* (1910).

Bancroft, SIR SQUIRE (1841-1926), born in London, appeared first on the stage at Birmingham in 1861, and in 1861 came to the Prince of Wales's in London. In 1867 he married Miss Marie Effie Wilton (c. 1840-1921), a distinguished actress, born at Doncaster, who in 1865 had begun the management of the Prince of Wales's in partnership with H. J. Byron. Under 'the Bancrofts' the theatre was famous for its perfect representation of J. W. Robertson's plays, *Caste*, *School*, and the rest, husband and wife taking the principal parts. In 1880 they moved to the Haymarket, but retired in 1885. Sir Squire Bancroft was knighted in 1897. See two autobiographical works by them (1888 and 1909).

Band, in architecture, is any flat fascia or ornament continued horizontally along a wall; also a moulding or suit of mouldings encircling a shaft.

Band, or **BANDS**, linen pendants from the neck, forming part of clerical, legal, and academic costume. It is a moot question whether they are a survival of the Amice (q.v.), or immediate descendants of the wide falling collar which was a part of the ordinary civilian dress in the reign of James I. In the Anglican Church they now are seldom worn, except by ultra-Low Churchmen; but they are in common use with Presbyterian ministers (ordained ministers as distinguished from licentiates). Foreign Catholic ecclesiastics wear black bands with a narrow white border.

Band. Military Bands differ from full orchestral bands in being wholly composed of wind-instruments and drums. The musical instruments allowed by government to regiments in the service are confined to trumpets and bugles for the cavalry and artillery, and fifes, bugles, bagpipes, and drums for the infantry and Highland regiments. The usual number attached to infantry regiments is 16 drummers and fifers (or buglers). The 16 are supposed to be able to play either instrument, and are commanded by a sergeant-drummer (formerly called drum-major). The Highland regiments have each, in addition, 5 pipers and a sergeant-piper (formerly pipe-major), who form a special pipe band. Cavalry regiments have 8 trumpeters and a sergeant-trumpeter (formerly trumpet-major). These several performers, who are paid 1d. per day more than private soldiers, are allowed for the strictly military purpose of signalling commands, &c., in circumstances in which the human voice would be useless. In addition to these there are generally a number of 'acting' pipers, trumpeters, &c., who do not get the extra 1d.

To meet the instrumental and other expenses of a full musical band, the officers above subaltern rank, in addition to a fixed sum on appointment and promotion, each contribute twelve days' pay per annum to a band fund. Government allows the services of 20 men, 1 corporal, 1 sergeant, and a bandmaster, over and above the drummers, &c. already described. Boys are also allowed to the extent of 1 per cent. of the men in the regiment. This brings the number up to about 30. To make the usual number of between 40 and 50 performers, extra men are drawn from the ranks; these are, however, liable to take rank duty on a full inspection parade of the regiment or in active service. In ordinary infantry regiments the pipers and drummers are not usually in the band, as their duties employ them otherwise. In the rifles, however, the buglers, who are more numerous than in other regiments, and in cavalry regiments the trumpeters, all belong to the band, except in such rifle regiments as have their buglers

organised into a separate bugle band. The number of men allowed for the band in cavalry regiments is 15, 1 corporal, 1 sergeant, besides boys, in addition to the trumpeters. Government also contributes £80 per annum to the band fund of each regiment. Cavalry regiments usually possess a double band (composed of the same performers)—namely, a brass band for mounted duty, consisting generally of valved brass instruments, treble, tenor, and bass, which can be played with one hand, leaving the other free for the management of the horse; and a reed band for dismounted duty or 'programme performance,' in which clarionets, flutes, bassoons, &c. are included. In marching regiments, where the performers have the use of both hands for their instruments, the selection is wider, and the following may be given as a type of a regimental band: 1 piccolo, 1 oboe, 2 E♭ clarionets, 12 B♭ clarionets, 2 bass clarionets, 2 bassoons, 4 horns, 2 baritones, 2 euphoniums, 4 basses, 4 cornets, 2 trumpets, 3 trombones, 2 drums. A great many regiments also have a few performers able to play stringed instruments, usually violoncello and double bass, to assist in the performance of classical music; some regiments even possessing a full string band. Previous to 1857, the bandmasters in the army were almost always private individuals, mostly foreigners, engaged by the officers to instruct the band, and young players were taught by them and the band-sergeant. In that year, however, government instituted a school of military music at Kneller Hall, Twickenham. At first it occupied the same anomalous position as the bands themselves, being partly supported by government and partly by a contribution of £10 per annum from each regiment; but in 1867 the War Office took it over as a government school, and now pays the entire expenses. It has a director of music and nine professors. The primary object of this school is to train promising men, usually band-sergeants recommended by their commanding-officer, for the position of bandmasters. They spend about two years in the institution, and are fully instructed in 'counterpoint' in four parts, and in a knowledge of the compass, capabilities, and proper combination of the various military musical instruments. The army is now altogether supplied with bandmasters from this college; about twenty per annum leaving to join different regiments. They belong to the service, are warrant-officers (a rank specially introduced into the army for their benefit), and are paid by government 5s. per day and rations, in addition to £70 per annum from the officers' band fund, with an allowance for house-rent when living out of barracks; the government strictly adhering to the anomaly of the position by thus paying only half the bandmaster's salary. Kneller Hall also trains such young instrumentalists for regimental bands as are recommended by bandmasters from among the most promising of their boys. These band boys either are sons of soldiers in the regiment, or come from the Duke of York's School, the Hibernian School, Dublin, the bands of industrial schools, or any source whence boys with a knowledge of music can be got. When a boy is recommended to Kneller Hall, he is kept for eighteen months or two years, thoroughly instructed in the use of his instrument, and returned to his regiment; and if he has talent and behaves himself, he has a good chance of eventually rising to the position of bandmaster. When a regiment goes from home on active service, if the absence promises to be short, as in the case of the Ashantee war, the band is left at home till its return; if the regiment is going on long service, the members of the band go with it and assist in ambulance duty, as for instance during the Indian Mutiny.

The sergeant-drummer in infantry regiments and

the sergeant-trumpeter in cavalry regiments is the *military* commander of the band, the bandmaster having authority only over the music, and the men as musicians. The various Guards' bands in London, the bands of the Royal Engineers, the Royal Artillery, and the Royal Marines at Chatham, Portsmouth, and Plymouth, are allowed more men than the line regiments. The Guards' bands have also the privilege individually of accepting private engagements, when these do not interfere with their duty, in plain clothes, in addition to the ordinary engagements as bands by 'permission of the commanding-officer.' The emoluments thus open to the men, induce a better class of musicians to remain in the service than would be the case were they restricted to their pay as soldiers. The bandsmen of line regiments have less opportunity of private engagements, and can only go in plain clothes by special permission. They have, however, their chance of band engagements, the receipts being divided among the band.

The duty of regimental bands is to play at regimental parades, at 'marches out,' to the officers at mess, and when required by the officers. Formerly the music required by the band had to be arranged and 'scored' by the bandmaster, but there are now many journals published (the earliest Boosey's *Military Journal*, 1846) with arrangements of all kinds of music for military bands, thus relieving the bandmaster from much of his hardest work. These journals are of great service to both military and amateur bands, bringing within the reach of every one the finest music, arranged by the very best musicians of the day.

Naval Bands.—Flag-ships carry bands, but other large ships (commanded by officers not less in rank than a captain) usually also do so. They have generally from 15 to 20 performers, and are supplied from the Naval School of Music at Eastney Barracks, Portsmouth. As in the army, the officers provide a band fund, from which the bandmaster's and bandmen's pay is supplemented and the other expenses met for music, &c. All naval bands are attached to and organised under the Royal Marines. This has greatly improved the efficiency and appearance of the bands, who now wear the same uniform as Royal Marines.

Volunteer and Amateur Bands.—The great development of the volunteer movement led to a corresponding development in amateur bands, nearly every volunteer regiment possessing one. Their organisation was, as closely as the circumstances permitted, identical with that of the regular army bands, and need not be further described. Other amateur bands are now common throughout the country, nearly every small town having its 'instrumental band.' Some of the amateur bands of Yorkshire and Lancashire, consisting mostly of working-men engaged in mills, iron-works, or collieries, are really good, executing all kinds of music in an astonishingly creditable manner, considering their opportunities for practice. Many districts have their annual brass band contests, at which considerable sums of money are given as prizes. For other bands, see ORCHESTRA. See also articles on the various instruments, as BASSOON, HORN, &c.

Banda, chief town of a district in the United Provinces, India, 95 miles SW. of Allahabad, on the right bank of the Ken River; pop. 21,000. It is a great mart for cotton.—The district of Banda contains 3061 sq. m., its chief product being cotton; pop. 657,000.—(2) A Tahsil on the north-east of the Saugur district, Central Provinces, India.

Bandages are used by surgeons to keep a part of the body at rest, to apply pressure, or to retain dressings or apparatus in position. There are two

chief varieties—the roller, and the triangular handkerchief bandage. The former is that most used for applying pressure and retaining dressings: the latter for fixing splints and as slings.

and as an immediate surgical appliance in cases of accident or emergency.

The Roller Bandage is a strip of calico, flannel, or elastic webbing, six yard long; its breadth should be one-fifth of the average circumference of the part to which it is applied. In applying it to a limb, it must commence at the extremity, and pass upwards without interruption towards the trunk. It must

cover the whole surface, and exert gentle and equable pressure throughout, especially in regions likely to be dependent, since swelling and discomfort occur at points where the bandage is absent or too slack; too tight bandaging, on the other hand, may hinder the circulation and lead to mortification of the part. Both edges of the bandage must be equally tight, or it will not lie smoothly on the limb, but will gape and tend to slip off. No two skin surfaces (e.g. two fingers) must be bound in contact, since the accumulation and decomposition

of cutaneous secretions between them will give rise to irritation. This can be avoided by interposing a layer of absorbent, antiseptic material, such as boric lint. When a harsh and inelastic bandage is used, it must not be applied directly to the surface, but over closely fitting woollen hose, arm-gloves, &c. which mitigate its pressure and protect the skin. A soft bandage may be applied directly; elastic webbing must only be applied over thick dressings or layers of cotton-wool that distribute and equalise the strong pressure it exerts. A bandage will slip unless both its ends are secured. In commencing to bandage any part of a limb, fix the roller by passing it round alternately above and below the prominence of the nearest available joint; then cover the part to be bandaged by encircling it with coils of bandage applied consecutively from below upwards, each loop covering the upper two-thirds of that previously applied. In parts where the limb thickens rapidly from below upwards, the bandage must be frequently 'reversed' to make it lie smoothly. Holding steady the loops already applied, the bandage is folded sharply upon itself from above downwards, so that the external surface of the loop next applied is the same that was next the skin in the previous loop. This corrects the tendency to leave portions of skin uncovered in conical parts of a limb. The bandage is fastened by a safety-pin, which should traverse several layers of the roller and any texture introduced between the bandage and the skin. The toes and finger-tips should be left uncovered; if they look dusky or become cold, it shows that the bandage is too tight, and must be at once loosened or removed.

Fig. 1.—Roller Bandage

Fig. 2.

The Handkerchief Bandage (fig. 2) is a triangular piece of cotton cloth, made by cutting a square yard of the material diagonally from corner to corner. It may also be constructed from an ordinary pocket-handkerchief, by dividing it in the same way, and combining the two small triangles thus produced into one larger triangle by tacking together two of their shorter sides (see fig. 2, B). When thus constructed, the bandage consists of a peak (fig. 2, A, P'), two sides (S'S'), two tails ('T'T'), and a base (B'). This appliance may be used for a great number of purposes in addition to those for which the roller bandage is applied. If it be desired to fix dressings in position, and to cover a large area of the body surface, it is used unfolded. If it be required to apply pressure firmly

and locally, or to fix dressings, splints, or other applications on movable parts, it is folded into a broader or narrower cravat form, as shown in fig. 2, C, and is thus applied to the part in question. In folding the bandage, the peak is turned over, so as to touch the middle part of the base (C, 1), and the handkerchief is then folded upon itself longitudinally to one-half or one-third of its present breadth, according to the larger or smaller circumference of the limb it is intended to encircle, and the size of the area it is desired to cover. For most purposes the narrower form (C, 2) will be found most convenient, since it adapts itself more easily to the inequalities of the part to which it is applied. In its unfolded form the handkerchief is used as a covering for the head

(fig. 2, *a*), and as a support to dressings applied to the shoulder (*b*), chest (*c*), stump (*c*), hand (*f*), foot (*g*), and hip (*h*). In this form also it is used as the ordinary sling for injuries of the upper extremity (*i*), where the weight of the arm is supported by the patient's neck and shoulders, and the injured parts are thus saved from strain and kept at rest. If this be supplemented by a second handkerchief bandage, folded narrow, which encircles the chest and the injured arm above the elbow (*j*), the whole upper extremity is not only supported but kept firmly immovable; which adds greatly to the comfort and safety of a patient immediately after an accident, during his transference to a hospital or to his home. In its folded form it makes an admirable temporary support to injured joints, such as the wrist (*k*), ankle (*l*), elbow (*m*), and knee (*n*), and in wounds of the eye (*o*), scalp (*p*), arm (*q*), thigh (*r*), &c., while the careful application of such a bandage satisfactorily supports the jaw (*s*) in cases of severe bruising or fracture. One of its most important uses in the narrow cravat form is to fix improvised splints *in situ* in cases of fracture of the extremities (*t*, *u*, *v*, and *w*). In this form it is also used as a wrist or hand sling (*x*), where the wrist-joint only is injured, and alone needs to be supported, or where a wound of the hand necessitates that member's complete rest. In cases of severe bleeding from wounds of the extremities, it should be used as a *tourniquet* (q.v.). If the bleeding be of a *spouting* character, it implies that an artery of considerable size is divided. In this case the bandage must be made to encircle the limb higher up than the seat of the wound, and must be tightened by twisting (*y*) until the limb is completely constricted and the bleeding temporarily arrested, while immediate surgical assistance is sought for. If the bleeding be of an *oozing* character, the bandage is not applied higher up the limb than the wound, but over the wound itself. A stone or other hard substance is firmly wrapped in a piece of cotton cloth or lint and thrust into the wound, and the cravat-handkerchief applied around the limb at the part sufficiently tight to hold this extemporised plug in position (*z*). Here, the object is not to control the circulation of the whole limb, but to prevent the escape of blood from the wound. This can be greatly assisted by attending to the position of the wounded limb in relation to the law of gravitation. In such circumstances it is usually sufficient, after applying the plug and bandage, to support the upper extremity in a sling, and to prop up the lower extremity on a high pillow. Should this, however, prove ineffectual, it is well to try firm flexion of the joints above the wound, which usually stops the bleeding. If this too fail, the whole limb must be constricted by the twisted handkerchief as above described; which, however, one would gladly avoid if possible, since it is a source of great suffering to the patient. In securing the ends of the bandage, they should either be tied together with a 'reef' knot (*), which will hold firmly, in contradistinction to the 'granny' knot (+), which tends to slip; or if the knot from its position cause discomfort to the patient, it should be dispensed with, and the two ends of the handkerchief sewn together with strong thread or sewing worsted. The figure represents the handkerchief bandage supplied by the St Andrew's Ambulance Association to its members for use as a 'first aid' to the injured in cases of accident and emergency.

Banda Isles, a portion of the Moluccas, consisting of 12 islands, 6 of which are uninhabited, about 50 miles to the south of Ceram. Their mean lat. and long. respectively are 4° 30' S., and 129° 50' E. Area, 17 sq. m.; pop. estimated at 500

Europeans and half-castes, and 8000 natives, mostly descendants of the emancipated slaves. The chief productions are nutmeg and mace, of which large quantities are exported. An active volcano, Gunong-API (1744 feet), rises near the centre of the group. In 1801-14 the islands were acquired by the Dutch.

Bandai-san, a volcano, with several peaks about 6000 feet high, near the centre of the main island of Japan.

Bandajan', a pass over a range of the Himalayas, in Kashmir; the summit being 14,834 feet above the sea.

Bandan'a, a kind of printed handkerchief of Indian origin, now extensively made in Britain, usually of cotton. The cloth is first dyed Turkey red, and then the pattern is made by discharging the colour with bleaching liquor in a powerful Biamah press. The pattern to be discharged is cut out on two plates of such metal (lead) as may not be acted on by the liquor, and of the full size of the handkerchief. A dozen or more are put in at once between the plates, and so many of these courses are entered together as fill the press, when the pressure is applied, and the liquor is run in on the uppermost plate, which is grooved on the upper side to receive it, and holed to pass it from plate to plate through all the cloth-folds in the press. The pressure on the cloth, to make clean work by preventing the spreading of the liquor, is enormous. The patterns in the real bandana style of printing are spots and diamond prints, the best suited for discharging, and even for these a pressure of 500 tons is required to work them clean. See CALICO-PRINTING.

Banda Oriental, a state of South America, constituted in 1825, after a war between the colonists (from Buenos Aires) and Brazil, as Banda Oriental del Uruguay—'Eastern Bank of the Uruguay,' now usually called simply Uruguay (q.v.).

Bandar Abbas. See BANDER ABBAS.

Bandel, ERNST VON, sculptor, was born in 1800 at Ansbach, studied art at Munich, Nuremberg, and Rome, and from 1834 lived chiefly at Hanover, engaged, off and on, for forty years on his great monument of Arminius, near Detmold, 90 feet high, which was unveiled by the Emperor Wilhelm on 16th August 1875. He died near Donauworth, September 25, 1876.

Ban-de-la-Roche, or STEINTHAL, a valley of Lower Alsace, in the Vosges Mountains, noted as the scene of the labours of Oberlin (q.v.).

Bandelkhand. See BUNDELKHAND.

Bandello, MATTEO, an Italian writer of *novelle* or tales, was born about 1480 at Castelnuovo in Piedmont. In early life he became a Dominican monk at Milan, but soon abandoned this vocation. After the battle of Pavia (1525) he was driven from Milan by the Spaniards, and settling in France, was in 1550 made Bishop of Agen. He died in 1562. Bandello's tales, 214 in number (4 vols. 1554-73; new ed. Bari, 1910-12), rank next to those of Boccaccio in Italy, and furnished themes to Shakespeare, Massinger, and other dramatists. They are distinguished by unaffected simplicity of style, fluency and vividness of narrative, and a harmonious brevity of periods. Often, however, they are very impure.

Band-fish (*Cepola*), a genus in the family Cepolidæ in the blenny-form division of Acanthopterygious Fishes (q.v.). The body is much elongated and laterally compressed, and is covered by very small scales. The dorsal fin is very long, and consists like the anal of soft rays. The tail vertebrae are very numerous, and the whole structure of the body exhibits unusual delicacy,

so that specimens are seldom obtained in an uninjured state. All the species inhabit quiet depths, and are unable to contend with waves and currents. The snakelike form and the beauty of their colours make them objects of great interest. One species, the Red Band-fish (*C. rubescens*), not uncommon in the Mediterranean, is occasionally cast ashore by storms on the British coasts. It is about 15 inches long. Its brilliant appearance, when seen moving in the water, has suggested the names of Fire-flame and Red Ribbon, by which it is known at Nice. The home of the genus is in Japanese waters.

Bandicoot (*Perameles*), a genus of small marsupials, occupying in the fauna of Australia a place somewhat analogous to that of the much larger shrews in Europe. Like the 'native rabbit' (*Macrotis lagotis*) and the peculiar form known as *Chacropus*, the bandicoots stand midway between carnivorous marsupials like the Tasmanian Devil, and the vegetarian Kangaroos, resembling the former in their dentition, the latter in the structure of the hind-feet. They have altogether 48 teeth, suited to their mixed diet of insects, worms, and roots, and have 10 upper incisors to 6 lower. In the fore-feet the three middle toes are long and clawed, the two outer rudimentary and clawless. The hind-feet are long and narrow, with only the fourth toe well developed.

Bandicoot (*Perameles nasuta*).

The fur is short and rough. The long head forms a pointed snout, the tail is rather short, the marsupial pouch is complete and opens backwards. They keep to the ground, making nests in the hollows, and ravage farm produce. The largest form (*P. nasuta*) measures about a foot and a half from tip of snout to origin of tail. Numerous species occur in Australia and New Guinea. The genus is of great zoological interest because of the occurrence of a true allantoic placenta, which is absent in other Marsupials (q.v.). See ALLANTOIS, PLACENTA.

Bandicoot Rat, MALABAR RAT, or PIG-RAT (*Mus giganteus* or *Nesocia bandicota*), the largest known species of rat. The name is derived from the Telugu *pandikokoku*, signifying pig-rat. The animal inhabits many parts of India, and is plentiful in Ceylon. It is chiefly found in dry situations, and often in hilly districts. It attains the weight of two or three pounds, and is 24 to 30 inches long, including the tail, which at the base is 2½ inches in circumference. The body is thick, and greatly arched, black above, grayish below. Its flesh is a favourite article of food with the coolies of India, and is said to be delicate, and much to resemble young pork. It feeds chiefly on grain and roots, and is very destructive in gardens. Its nests, when rifled, are frequently found to contain considerable quantities of rice, stored up against the dry season.

Bandiera, ATTILIO and EMILIO, two brothers of a Venetian family, lieutenants in the Austrian navy, who attempted a rising in favour of Italian

independence in 1843. The attempt was a failure, and they fled to Corfu; but, misled by false information, they ventured to land in Calabria with twenty companions, believing that their appearance would be the signal for a general insurrection. One of their accomplices had betrayed them, and the party was captured at once by the Neapolitan police. Attilio and Emilio were shot along with seven of their comrades in the public square of Cosenza on the 25th July 1844. Both were men of lofty spirit, and their enthusiastic patriotism breathes in every line of their letters to Mazzini, who was then in London. These letters were opened by authority of the British government; see Parker's *Life of Sir James Graham* (1907) and the life of the brothers by Pierantoni (1909).

Bandinelli, BACCIO, the son of a famous goldsmith of Florence, and one of the best sculptors of his time, was born at Florence in 1493. He was an angry and jealous rival of Michael Angelo, whose grandeur of conception he strove to equal, and who is said to have retaliated his enmity by contempt. His genius, however, secured him many admirers and patrons among persons of distinction, and Pope Clement VII. even bestowed on him an estate. Among his best works, which all exhibit power, vigour, and skilful drawing, are his colossal group of Hercules with Cacus at his feet, his Adam and Eve, his copy of the Laocoon, and the exquisite *bassi-relievi* which adorn the choir of the Duomo in Florence, where he died in 1560.

Bandit. See BRIGANDS.

Band of Hope, the name given about 1847 to societies of young people, pledged to abstain from all intoxicating liquors. Now nearly every town and village of the United Kingdom contributes its quota of adherents, and since 1889 qualified lecturers give lectures in thousands of day-schools. The United Kingdom Band of Hope Union (1855) had by 1919 affiliated with it some 30,000 societies of juvenile abstainers, having more than three millions of members. See TEMPERANCE.

Bandoline is a mucilaginous substance used for stiffening hair, and keeping it in shape or form. It is usually prepared from gum tragacanth, two ounces of which, when digested with a quart of rose-water for two days at a gentle heat, yield a translucent jelly, which is further perfumed by the addition of otto of roses, or oil of bitter almonds. It is also prepared by boiling Carrageen (q.v.) or Irish-moss with water, or by soaking quince-seeds in cold water for a day or two.

Bandon, or BANDONBRIDGE, a town of County Cork, Ireland, on the Bandon, 20 miles SW. of Cork by rail. Bandon was founded in 1608 as a Protestant colony by the first Earl of Cork, was incorporated by James I., and now belongs chiefly to the Duke of Devonshire. Brewing, distilling, and tanning are the chief industries. The pop., which was 6131 in 1871, had diminished to 3122 in 1911. Up till 1885 Bandon returned one member to the House of Commons.—The river Bandon rises in the Carberry Mountains, and at its mouth forms the harbour of Kinsale. Spenser describes it as 'the pleasant Bandon, crowned by many a wood.' It has a course of 40 miles, for 15 of which it is navigable to Innishannon, 4 miles below Bandon.

Bandong, or BANDUNG, a flourishing commercial town in the centre of the western end of Java, in the vicinity of the volcano Gunung Gun-tour. Since 1864 it has been the capital of the Pre-anger Regencies province. Pop. 48,000 (2200 whites).

Bandy Legs. See LEG.

Baneberry, or HERB CHRISTOPHER (*Actaea spicata*), is a native of Europe, occurring rarely in the north of England. It is a perennial

herb, with leaves ternately compound, deeply serrate, the flowers in racemes, the berries black and poisonous. The root has been used in medicine, but is of dubious reputation; those of two North American species were in high esteem among the Indians, especially as remedies for snake-bites. The genus is included in Ranunculaceæ, or reckoned a family (Actæaceæ) by itself.

Banff (pron. *Bamf*), a seaport, once a parliamentary burgh, capital of Banffshire, on the Moray Firth, at the mouth of the Deveron, 50 miles NNW. of Aberdeen by rail; its former Low Town and Sea Town now form a continuous whole. On the right bank of the Deveron, $1\frac{1}{2}$ mile ENE., is the fishing-town of Macduff. Scarce a fragment remains of the old castle, in which Archbishop Sharp was born; the present castle is a plain 18th-century edifice. Duff House was built in 1745 by the elder Adam. In 1907 it was given to the town of Banff by the Duke of Fife, and later became a hospital. The public buildings include a town-house (1796), the county buildings (1871), a lunatic asylum (1865), Chalmers' Hospital (1862), and a museum, of which Thomas Edward (q.v.) was long curator. With Elgin, Cullen, Inverurie, Kintore, and Peterhead, Banff (including Macduff) sent one member to parliament till 1918, when it was merged in the county. Pop. (burgh of Banff), 3500; (burgh of Macduff), 3300.

Banff, a summer-resort, with hot sulphur springs, in the magnificent mountain country of SW. Alberta, is on the Bow River and the Canadian Pacific Railway, 920 miles west of Winnipeg. It is the railway centre for the Rocky Mountain National Park (with an area of 5000 sq. m.). Pop. 1000.

Banffshire, a county in the NE. of Scotland, on the Moray Firth, and between the counties of Aberdeen and Elgin and Inverness. Standing fourteenth in area of the Scottish counties and (in 1921) sixteenth in population, its greatest length is 59 miles, its greatest breadth is 31, and its area is 630 sq. m. The surface, especially in the south and south-east, is mountainous, interspersed with fertile valleys and fine pastures; but near the coast it is comparatively level. The chief mountain-ranges, rivers, and strike of the stratified rocks, run from south-west to north-east, and the whole county is an extensive slope in the same direction, from the Grampians to the Moray Firth, into which the rivers flow. The coast is rocky, but not high, except to the east of Banff. Chief summits are the Bin of Cullen (1050 feet), Knock Hill (1409), Meikle Conval (1867), Ben Rinnes (2755), and, on the Aberdeenshire border, Ben Macdui (4296). The chief rivers are the Spey, which bounds a third of the county on the west; and the Deveron, 61 miles long, and mostly included within the county. The predominant rocks are granite, quartz rock, mica-slate, clay-slate, syenitic greenstone, graywacke, graywacke-slate, old red sandstone with fossil fishes, metamorphic limestone and serpentine. The serpentine near Portsoy has long been famous as the 'Portsoy marble.' Lead, iron, antimony, and plumbago occur in small quantity. The soil in many parts is very fertile, and highly cultivated. About 38 per cent. of the entire area is in cultivation, more attention being paid to the breeding of cattle than to crops. The manufactures are unimportant, Glenlivet whisky excepted. The herring-fishery is largely carried on; and the salmon-fisheries of the Spey and Deveron are very valuable, the Spey ranking after the Tweed and Tay as a salmon-river. The southern part of Banffshire is in the Highlands, the north being purely Lowland in aspect as in race-characters. Banffshire is divided into the districts of Enzie, Boyne, Strathisla, Strathdeveron, Balveny, Glenlivet, and Strath-

avon. The chief towns and villages are Banff, Macduff, Portsoy, Keith, Cullen, Buckie, Dufftown, and Charlestown of Aberlour. The counties of Banff, Aberdeen, and Elgin enjoy the Dick Bequest (q.v.) for parochial education. The county returns one member to parliament. Banffshire contains numerous remains of antiquity, as the old churches of Gamrie and Mortlach, and the ruined castles of Auchindoun, Balvenie, Boharm, and Findlater. The battle of Glenlivet (q.v.) was fought in 1594. Pop. (1801) 37,216; (1841) 49,670; (1881) 62,736; (1911) 61,402; (1921) 57,293.

Bangalore, a fortified town and administrative headquarters of Mysore, in a district of the same name, 216 miles W. of Madras by rail. When Mysore was occupied by Britain in 1831, Bangalore was made the administrative capital of the state; and when in 1881 Mysore was restored to the rule of its maharaja, the British cantonment of Bangalore, containing the Residency, was specially exempted from native jurisdiction. Silk and carpets are the principal manufactures; and there is a brisk trade. Lying 3000 feet above sea-level, in the middle of the Mysore tableland, Bangalore has a cool and healthy climate. It was a favourite residence of Hyder Ali; and in 1791 it was stormed by the British under Lord Cornwallis. It is still by far the largest city in the state; but the town of Mysore is now the dynastic capital and residence of the maharaja. Pop. (1921) 238,111. There is here a great institution for post-graduate instruction and research in science; also two of the constituent colleges of Mysore University.

Bangiaceæ, an order of seaweeds doubtfully classed with the Rhodophyceæ, though they differ from ordinary red seaweeds in some important points of structure. The thallus is composed of filaments or plates, one cell thick, without pits between the cells. Reproduction is sexual and asexual. Female reproductive cells differ but slightly from ordinary thallus cells. It is a small order, but world-wide. *Porphyra* (laver) and others are common on the British coasts.

Bangkok, capital (since 1769) and chief port of Siam, situated on both banks of the Menam, about 20 miles from its mouth. The population is 630,000, about one-fourth being Chinese, the others including Burmese, Annamese, Cambodians, Malays, Eurasians, and Europeans. The approach to Bangkok by the Menam is exceedingly beautiful. Stone buildings are used for the royal palaces, some noblemen's houses, monasteries, and the dwellings of Europeans. A large number of the houses float on rafts, fastened by ropes to poles; most of the trade of the city is conducted upon the river. The internal traffic of Bangkok is in large measure carried on by means of canals, but of late years a number of ordinary thoroughfares have been constructed, and many brick houses have been erected. The older-fashioned native houses on land—of bamboo or other wood, like the floating-houses—are raised upon piles, 6 or 8 feet from the ground, and are reached by ladders. The circumference of the walls of Bangkok, which are 15 to 30 feet high and 12 broad, is about 6 miles. Bangkok is the constant residence of the king. The palace is surrounded by high walls, and is nearly a mile in circumference. It includes temples, public offices, accommodation for officials and for some thousands of soldiers, with their necessary equipments, a theatre, apartments for a crowd of female attendants, and several Buddhist temples or chapels. Several of the famous white elephants are kept in the courtyard of the palace. Throughout the interior are distributed the most costly articles in gold, silver, and precious stones. The

temples of Bangkok are very numerous, and are decorated in the most gorgeous style. The foreign trade of Siam centres in Bangkok, and is mainly in the hands of the Europeans and Chinese. A bar at the mouth of the Menam compels vessels drawing more than 13 feet to anchor at Paknam. Imports include cotton and silk goods, provisions, iron, steel and machinery, gunny-bags, opium, sugar, tobacco; and exports (chiefly to Singapore and Hong-kong), rice, teak (declining), hides, marine products, timber, sticklac, pepper. Since 1893 Bangkok has made marked progress in many directions; witness its numerous rice and saw mills, shipbuilding and engineering yards, dry-docks, modern thoroughfares, gas and electric lighting, electric tramways, new water-supply (1914), various educational institutions (including a university, inaugurated 1917), and extensive railway and telegraphic communications. There are telegraph-lines to Penang, Burma, and Cambodia; a wireless station; railways to Paknam (14 miles), eastwards to Korat (165 miles), northwards to Chieng-Mai in the Shan States, and southwards (Malay Peninsula Railway) to Sengora and Straits Settlements. In 1893 French warships forced their way to Bangkok, and secured a treaty making important concessions to France. See SIAM.

Bangor, an episcopal city, parliamentary borough, and seaport of Carnarvonshire, North Wales, on the SE. shore of the Menai Strait, 60 miles W. of Chester. Its fine scenery and educational institutions have made it a favourite resort, and the opening of the Chester and Holyhead Railway (1850) greatly promoted its prosperity. The town consists of an upper (residential) quarter and a lower (business) quarter. Its chief trade is derived from the great Penrhyn slate-quarries at Bethesda (q.v.). The slates are exported, and are also manufactured at Bangor into tables, chimney-pieces, &c. Penrhyn Castle and woods are near Bangor. Population, 11,200. Bangor unites with Carnarvon, &c., in sending one member to parliament. It is a place of great antiquity. In 525 St Deiniol founded a college here; and in 550 he became the first bishop; the cathedral founded by him was thrice destroyed, in 1071, in 1282, and in 1402. The present cruciform edifice, built between 1496 and 1532, was 'unequalled in meanness' amongst the cathedrals of the United Kingdom, until in 1869 Sir Gilbert Scott began to restore it, and it was reopened in 1880, much as it must have been in the 15th century. In 1883 Bangor received a municipal charter. The University College of North Wales, now a college of the University of Wales, was founded in 1884, and installed in a noble edifice opened in 1911; it has some twenty professorships, and Halls of Residence for Women and Men. Bangor contains several public schools and training colleges for teachers and ministers.

Bangor, a small seaport and watering-place in County Down, on the south side of the entrance to Belfast Lough, 12 miles ENE. of Belfast by rail. Population 8000. St Comgall in 555 founded Bangor Abbey, which in the 9th century had 3000 inmates, and which forms the subject of an interesting monograph by the Rev. Charles Scott (2d ed. Belfast, 1837).

Bangor, a city and port in the state of Maine, 246 miles NE. of Boston by rail, on the Penobscot, about 60 miles from its mouth, and at its confluence with the Kenduskeag, which affords extensive water-power. At spring-tides, which here rise 17 feet, the harbour is accessible from the sea for the largest vessels, and as the navigation cannot go higher, Bangor is one of the largest lumber depôts in the world, absorbing and monopolising the trade of the heavily timbered basins of the

Penobscot and its tributaries. About 200,000,000 feet of lumber are annually shipped from Bangor during the season of eight months. Bangor possesses a custom-house of granite, several churches, a theological seminary, foundries, planing and sawing mills, furniture factories, &c. Bangor has also some shipbuilding, and foreign and coasting trade. Under English rule the place was known as Kenduskeag; its present name was taken from the well-known psalm-tune, a favourite of one of its ministers, Seth Noble. It was incorporated as a city in 1834. Pop. (1870) 18,289; (1880) 16,856; (1900) 21,850; (1920) 25,978.

Bangorian Controversy. Dr Benjamin Hoadly, Bishop of Bangor, in a sermon preached before George I. in 1717 advanced opinions on the power of the church, by denying the authority of the church over the conscience. He thus drew on himself the fiercest opposition from the advocates of ecclesiastical authority, and provoked a long and keen controversy. In one month as many as seventy-four pamphlets were published on the subject. See HOADLY.

Bangor-iscoed ('Bangor below the Wood'), a Welsh village, beautifully situated, in a fertile and richly wooded country, on the right bank of the Dee, in a detached portion of Flintshire, adjoining the counties of Chester and Salop, 5 miles SE. of Wrexham. Pop. of township, about 600. It was once the seat of one of the largest monasteries in Britain, founded before 180 A.D., and containing 2400 monks in the time of St Augustine. To distinguish it from Bangor in Carnarvonshire it is sometimes called *Bangor in Maelor*, or *Bangor Monachorum*.

Bangsring (*Tupaia*), a family of arboreal insectivorous mammals, sometimes known as squirrel or tree shrews. There are two genera—*Tupaia*, with numerous species, of which the larger are 8 or 9 inches long; and *Plilocercus*, with a single species, the Bornean pintail. They are all oriental animals, and range from the Khasia Hills in India, to Java and Borneo. The fur is soft and glistening, and a long bushy tail is generally present. They are restlessly active during the day, searching for insects and fruits. Two of the largest species are the Tana (*T. tana*), with a feathery tail, in one variety of a bright golden colour; and the Ferruginous Bangsring (*T. ferruginea*), widely distributed in the Malayan region. The soles of the feet in the latter are plaited like those of geckos, and give the animals a sure grip of a branch. See INSECTIVORA.

Bangweo'lo (also called Bemba), a great Central African lake, discovered by Livingstone in 1868, which is 150 miles long by 75 in width, and 3700 feet above the sea. The Chambese, which flows into it, and the Luapula which issues from it, constitute the head-stream of the Congo. The shores are flat, and parts of the lake are mere marsh. In the NW. part are four large islands, inhabited by the Mboghwa, a race of fishermen and herdsmen. On its south shore Livingstone died.

Banialu'ka, a town of Bosnia, picturesquely situated on the Vrbas, in a fine forest district, 40 miles ESE. of Novi. It is strongly fortified, and, besides some Roman remains, contains warm baths, forty-four mosques, important powder-mills, and about 15,000 inhabitants, of whom some two-thirds are Mussulmans.

Ban'ian (from the Sansk. *vanij*, 'a merchant'), a member of a Hindu merchant-caste, most numerous in Bengal and the United Provinces of India. The name was originally applied more particularly to those from the province of Guzerat,

many of whom had settled early in Arabian ports for purposes of trade; but was frequently extended by early writers to all Hindus in Western India. This class, which numbers somewhere between 3,000,000 and 4,000,000 souls, carries on an extensive trade, by means of caravans, with the interior of Asia, even to the borders of Russia and China. Contrary to the general custom of the Indian people, these merchants travel much, and the establishments and counting-houses of Indian Banians are to be found in almost every commercial town of any note in Asia, whilst in Africa they were even at one time identified with the slave-trade. Generally speaking, those with sufficient capital subsist solely by money-lending, charging usurious rates of interest; the poorer classes open retail shops, or hawk their goods about the country villages. The members of the caste are mutually helpful, even advancing money to one another at reasonable interest.

Ban'ian-tree. See BANYAN.

Banim, JOHN, Irish novelist, born at Kilkenny in 1798, in 1813 went up to Dublin to study art, and two years later became a drawing-master in his native town. His youth was darkened by an unhappy love-affair; but having achieved some success as a playwright (1821), having married, and settled in London, he produced, in conjunction with his brother Michael (1796-1874), the *Tales of the O'Hara Family* (6 vols. 1825-26), which were followed by *The Croppy*, *The Denounced*, *The Smuggler*, *The Mayor of Windgap*, *Father Connell*, &c. In 1836 general sympathy having been attracted towards Banim's privations, occasioned by disease that precluded all literary exertion, a pension of £150 was awarded him, which was afterwards further increased by £40 for the education of his daughter, an only child. He died in poverty, 13th August 1842, at Windgap Cottage, near Kilkenny. Banim failed in his attempt to portray the manners and frivolities of the higher classes; but none of his predecessors succeeded in depicting so vividly and truly the Irish peasant. Although generally happy in the plot and development of his story, he is too much disposed to dwell on the horrible. His denunciations may be well founded, but they mar the poetic effect. Banim was also not quite free from a somewhat tiresome minuteness of description, and his imitation of Scott is frequently very palpable. See P. J. Murray's *Life of John Banim* (1857).

Banishment (the act of putting under *ban*, 'proclamation,' as an outlaw), the exclusion of the offender from native privileges and his abandonment to enemies and strangers, without 'supervision or the assignment of any precise place of abode.' Thus Scots criminals might be banished from Scotland. Under English law banishment of a subject beyond the seas was not a lawful punishment at common law except under the obsolete procedure of abjuring the realm. Sometimes it involved outlawry and loss of civil rights, sometimes not. In later English law the term was transferred to deportation or transportation with confinement. Transportation was originally introduced by giving pardon conditional on the convict's remaining in a colony for seven years and passing five of them in service. In the 18th century it became a statutory punishment for many felonies and some misdemeanours—e.g. perjury. By statute (20 & 21 Vict. c. 3) transportation under the sentence of a court was abolished, and penal servitude was substituted. The idea of banishment occurs in the ostracism of Greece, and the relegation, exile, and deportation of Rome. It was generally accompanied by forfeiture of civil rights. See OSTRACISM, OUTLAWRY, PRISONS.

Banjermassin', a former sultanate on the S.E. of Borneo, with an area of 5928 sq. m., and a pop. of about 300,000, chiefly Mohammedans. Tributary to Holland since 1787, it was annexed on the death of the last sultan in 1857, and is now governed by the Dutch resident for the south and east of Borneo, who has an assistant at Martapura, where the sultans formerly lived. Banjer-massin is watered by large rivers and intersected by a chain of mountains, in several parts rising to 3000 feet. Excellent small-arms are manufactured. The products are pepper, wax, edible nests, rattans, benzoin, dragons' blood, coal, iron, diamonds, and gold dust.

BANJERMASSIN, the capital of the residency, is built on the island of Tatas, about 15 miles from the mouth of the Banjar or Barito; pop. 50,000. The town is subject to frequent inundations, and the houses are raised on piles, most of the traffic being carried on in boats. The trade, which is considerable, is mostly in the hands of the Chinese, and the imports include piece-goods, gunpowder, opium, rice, sugar, salt, Chinese porcelain, silks, and a few horses from Java.

Banjo (originally a mere negro mispronunciation of *bundore*, derived through the medium of Spanish or Portuguese, from Lat. *pandura*, Gr. *pandoura*, a three-stringed musical instrument), an instrument of the guitar kind, played with the fingers, without frets to guide the stopping. It has a long neck; a body like a drum, of parchment stretched on a hoop, and without a back; and five catgut strings. It became known principally through its use by the coloured minstrels of the United States, a company of whom came to England in 1846. The 'zither-banjo' has a wooden back.

Banka, or BANGKA. See BANCA.

Banker-marks. See MASONS' MARKS.

Bank Holidays, as appointed by Lord Avenbury's act of 1871, fall in England and Ireland on Easter Monday, Whit-Monday, the first Monday in August, and 26th December; in Scotland, on Christmas and New-year's Days, Good Friday, and the first Mondays of May and August.

Banking. The word 'bank' as connected with the business of banking is identical with *bank* in the sense of 'bench,' and ultimately cognate with *bank* in the sense of 'ridge of ground.' It is accordingly of Teutonic origin, but associated with the mediæval Latin word *bancus*, meaning a bench and occasionally a counter. The word bank, as something supplied by several persons, occurs in Bacon's essay on Usury in the sentence, 'Let it be no bank or common stock,' referring to a proposal which would serve 'to invite moneyed men to lend to the merchants for the continuing and quickening of trade.' The business of banking has been carried on for many ages. Arnold in his *History of Rome*, speaking of the commissioners appointed for the relief of distressed debtors who wanted ready money for *bond fide* trade purposes by the consuls in the year 403 B.C., with the title of *mensarii*, or bankers, says: 'These established their banks or tables in the forum like ordinary bankers.' Private bankers were known of in Venice at least as soon as the 13th century. The trade began, as Professor Dunbar of Harvard University relates in his description of the Bank of Venice contained in his *Economic Essays*, 'as an adjunct of the business of the *campsores*, or dealers in foreign moneys. In a city having a great and varied trade with many countries, these dealers necessarily held an important place, close to the stream of payments which was constantly in motion. As early as 1270 it was deemed necessary to require them to give security to the government as the condition of carrying on their business, but it is

not shown that they were then receiving deposits.' Italy thus early took a leading place in the business. Mr F. G. Hilton Price, in his *Handbook of London Bankers*, gives in an extract from the state papers the petition of 'Cristofero Hagenbuch e Compagni' to Queen Elizabeth for authority to institute an office which would not only provide Her Majesty 'with whatever notable sum of money your Majesty may wish, but, by this means, your state and people also; and it shall keep the country in abundance and remove the extreme usuries which devour your Majesty and your people.' The petition is in Italian, and is endorsed by Francis Walsingham, 'The Office of a Banke.' Nothing came of this proposal or of several others somewhat similar in character which are chronicled by Mr Price down to the time of King Charles II. Gradually the business of banking was developed by the goldsmiths of London, who are described in the *Little London Directory* of 1677 as keeping 'running cashes,' and who thus commenced the business before the opening of the Bank of England, founded in 1694. The expression 'running cashes' had been in use some fifty years at this time (Anderson's *History of Commerce*, vol. ii. p. 402). Up to the year 1640 the Royal Mint in the Tower of London had been made use of as a kind of bank or place of deposit for merchants to lodge their cash within in safety. The action of King Charles I. in seizing the cash in the Mint caused an alteration in this respect. The result is best narrated in Anderson's words: 'The merchants and traders of London generally trusted their cash with servants, until the breaking out of the civil war, when it was very customary for their apprentices and clerks to leave their masters and go into the army. Whereupon, in such unsettled times, merchants, not longer daring to confide in their apprentices, began first, about this year 1645, to lodge their necessary cash in goldsmiths' hands, both to receive and pay for them, until which time the whole and proper business of London goldsmiths was to buy and sell plate, and foreign coins of gold and silver, to melt and cull them, to coin some at the Mint, and with the rest to supply the refiners, plate-makers, and merchants, as they find the price to vary. This account of the matter we have from a scarce and most curious small pamphlet, published in the year 1676, entitled *The Mystery of the new-fashioned Goldsmiths or Bankers discovered*, in only eight quarto pages. Our said author further observes "that this new banking business soon grew very considerable. It happened," says he, "in those times of civil commotion, that the parliament, out of the plate, and from the old coin brought into the mint, coined seven millions into half-crowns; and there being no mills then in use at the mint, this new money was of very unequal weight, sometimes twopenne and threepence difference in an ounce; and most of it was, it seems, heavier than it ought to have been, in proportion to the value in foreign parts. Of this the goldsmiths made naturally the advantages usual in such cases, by picking out or culling the heaviest, and melting them down, and exporting them. It happened, also, that our gold coins were too weighty, and of these also they took the like advantage.

"Moreover, such merchants' servants as still keep their masters' running cash, had fallen into a way of clandestinely lending the same to the goldsmiths, at fourpence per cent. per diem; who by these and such-like means were enabled to lend out great quantities of cash to necessitous merchants and others, weekly or monthly, at high interest; and also began to discount the merchants' bills at the like or an higher rate of interest. That, much about the same time, they [the goldsmiths or new-fashioned bankers] began to receive the rents of

gentlemen's estates, remitted to town, and to allow them and others, who put cash into their hands, some interest for it, if it remained but for a single month in their hands, or even a lesser time. This was a great allurements for people to put their money into their hands, which would bear interest till the day they wanted it [somewhat like our English East India Company's bonds]. And they could also draw it out by one hundred pounds, or fifty pounds, &c., at a time, as they wanted it, with infinitely less trouble than if they had lent it out on either real or personal security. The consequence was that it quickly brought a great quantity of cash into their hands" (Anderson's *History of Commerce*, vol. ii. pp. 402-3).

The system of banking as practised at the present time—that is, of keeping an account with a banker into which available ready money may be paid, and from which any amounts that are required may be drawn out by means of cheques—gradually grew out of the habit described, and followed on the early system by which the notes of a banker were accepted generally through the personal confidence which was placed in him. 'The term banking was then applied only to the issue of notes and the taking up of money on bills on demand' (Bagehot, *Lombard Street*, p. 98). This was the earlier system, and the great convenience it was to persons of all classes promoted and encouraged its existence. The circulating medium of the country during the 18th and the early part of the 19th century to a large extent consisted of notes. The carrying on the business of banking was, at its origin in the United Kingdom, intimately connected with the power of issuing notes. It is clear from the act of 1742 referring to the Bank of England that parliament understood by 'banking' only the issue of notes. In early days the resources of a bank in the way of its note circulation were very much greater than those derived from the deposits of its customers. The accounts of the Bank of Dundee, which commenced operations in 1764, are in accordance with this, and show that the Bank of Dundee did not begin to receive deposits till the year 1792, in which year they amounted to £35,944, with a note circulation of about £50,000.

Adam Smith, whose life extended from 1723 to 1790, saw the first commencement of banking in the modern sense in the United Kingdom. The references to banks of deposit which Adam Smith makes in the *Wealth of Nations*, and particularly concerning the Bank of Amsterdam, are connected with a banking system of an entirely different class from that which exists in the United Kingdom, or indeed in commercial Europe, at the present time, and which derived its origin from the conditions of the current coin in the great trading nations of that period. Adam Smith describes the position of matters in these respects as follows: 'The currency of a great state such as France or England generally consists almost entirely of its own coin. . . . But the currency of a small state such as Genoa or Hamburg can seldom consist altogether in its own coin, but must be made up, in a great measure, of the coins of all the neighbouring states with which its inhabitants have a continual intercourse.' A currency of this class was naturally very inconvenient to the merchants who had to meet the demands continually made on them. To enable this to be done the Bank of Amsterdam, which city was then one of the largest centres of foreign trade, was established. Adam Smith says: 'It is generally reckoned that about 2000 persons kept accounts with the bank; while Oudermeulen, in *Bankwezen*, quoted by Dunbar, estimated the number at 5000. These all obtained the use of 'bank money,' which really represented a credit in the books of the bank granted against coin which had been deposited

there, and with this 'bank money' were able to pay the bills that were drawn upon them. For the privilege of using this currency a regular charge was made on all the holders of accounts, the charge being naturally higher on the small transactions, which caused equal or possibly more labour to the bank, and were less remunerative to it. Adam Smith's description of the operations of the Bank of Amsterdam is the most complete of any contemporary statement on the subject. The bank was established in 1609 under the guarantee of the city, which derived a considerable revenue from it. Having contributed for more than two centuries greatly to the prosperity of Amsterdam, the bank was wound up after the French invasion of Holland towards the end of the 18th century.

The last survivor of the institutions of this description was the Bank of Hamburg, the business of which came to an end in February 1873, when the establishment of the empire of Germany and the institution of a uniform currency over the whole of that country, in conjunction with the general improvement of the coinage current in Europe, removed the necessity for such institutions. These banks of deposit, besides providing a recognised currency for the payment of foreign bills of exchange, were of service by economising the use of the circulating medium. This was done upon the principle of transfer. The principle of transfer was one of the first which was brought into operation in modern banking, and it is put into practice daily every time a cheque is drawn which is placed to the credit of the person to whom the money belongs, either at the same or at another bank. The amount of money in the banks remains the same, but the ownership is altered.

Besides the reference to these institutions in the *Wealth of Nations*, there is the well-known passage in the volume referring to banking: 'The only trades which it seems possible for a joint-stock company to carry on successfully without an exclusive privilege are those of which all the operations are capable of being reduced to what is called a routine, or to such uniformity of method as admits of little or no variation. Of this kind is, first, the banking trade. . . . Though the principles of the banking trade may appear somewhat abstruse, the practice is capable of being reduced to strict rules.' The experience of considerably more than a century has shown the truth of this remark, but it was long before the law of England permitted the suggestion to be put into practice. With the one exception of the Bank of England, banking in England, Wales, and Ireland was for many years after Adam Smith wrote conducted only by one form of banks—private banks, which consisted of firms with not more than six partners, and having the power, which they generally exercised, of issuing notes.

The difficulties experienced in carrying on business about the middle of the 18th century through the absence of a generally acceptable circulating medium is incidentally shown by a transaction mentioned in a letter written by the great-grandfather of the present writer, Mr James Turner, who established the bank at Great Yarmouth in partnership with the Gurneys in 1781. This letter, written 30th September 1774, referring to a sale of land for which the sellers had taken 'the deposit money in notes,' continues: 'That the vendors cannot' accept the payment for it 'in bank or bankers' notes, as turning the same into cash at that time of year will be attended with a great expence.' The date when the payment became due was 24th December, and a suggestion was accordingly made that a bill should be drawn for the balance due—about £2000—as this would save 'the risk and expence of sending down that sum.'

The Note Issues in England.—During the 18th

century and for a considerable part of the 19th, as was mentioned in reference to the establishment of the Bank of England, the business of banking in England outside the metropolis, and even to a great extent in London, consisted to a great degree in the issue of notes. The issuing banks were very numerous, and large transactions were carried out through the notes. The total amount was undoubtedly large, but few trustworthy statements of the amounts of the actual circulation have been preserved. The following figures from *Marshall's Digest* (printed by recommendation of the Select Committee of the House of Commons on Public Documents, 1st March 1833) give some idea of the position of matters in England and Wales:

	Note Circulation.		Total.
	Bank of England.	Country Bankers.	
1814.....	£27,000,000	£23,000,000	£50,000,000
1820.....	24,500,000	10,500,000	35,000,000
1830.....	20,000,000	7,600,000	28,100,000

From 1805 to 1825 the private deposits in the Bank of England did not exceed two millions, and were rarely more than one. In 1828 they reached five millions for the first time. These figures give us a fair idea of the position of banking at that period. The estimates of the amount of the note circulation down to the year 1844 vary greatly from each other, and besides those preserved in *Marshall's Digest* there is no general statement which can be depended on. Sir Robert Peel, by his Bank Act of 1844, required the particulars to be published. By that date the deposits of banks had begun to increase and cheques to take the place of notes, which accordingly became of less importance. The number of the note-issuing banks in England and Wales has greatly diminished during the last few years. Of a fixed issue allowed by the Bank Act of 1844 (carried by Sir Robert Peel) amounting to £3,631,647 divided between

207 private banks.	£5,158,417
72 joint-stock banks ...	3,478,230

£8,631,647

only £669,480 remained in 1911 in the hands of

10 private banks....	£423,749
7 joint-stock banks ...	245,731

£669,480

with an issue of about £160,000 notes in actual circulation. The loss of the note issue has been a great disadvantage to banking in England and Wales. It would be an easy thing to arrange a plan which would provide complete security for such a circulation, which should not include notes of a lower value than £5. In Scotland the limit of £3,087,209 possessed by nineteen banks in 1844 is now reduced to £2,676,350 possessed by eight banks. In Ireland the fixed issue of £6,354,494 possessed by six banks in 1844 remains altogether unaltered. The actual note circulation in 1911 was about £7,000,000 in Scotland, and rather more than £7,600,000 in Ireland. In England and Wales the notes issued by the Bank of England, which are practically the only notes used there, averaged some £29,000,000 in 1911. By far the greater part of the circulating medium of the United Kingdom, except in some degree in Ireland and in a greater degree in Scotland, now consists of cheques—that is, of entries in the ledgers of banks—with the use of specie, gold coin, silver, and bronze, for amounts below 20s., and not even for all of these, as the use of cheques for very small sums increases continually.

The privilege which the Bank of England possessed of being the sole bank on the joint-stock principle (with limitation of the liability of the holders of its stock to the amounts they had subscribed) prevented the establishment of any other joint-stock bank in England and Wales up to the year 1826, when 'an act of parliament was

passed to permit the formation of banks having more than six partners at a greater distance than 65 miles from London, with a provision, however, that such banks should not make their notes payable in London, nor draw bills upon London for a less amount than £50' (Gilbart's *History and Principles of Banking*). Under this act a good many joint-stock banks, of which the Lancaster Banking Company, founded October 23, 1826, (amalgamated with the Manchester and Liverpool District Banking Company, Limited, 1907), was the earliest, were established. The act of 1833 carried this permission a step further, and allowed the establishment of joint-stock banks—banks with more than six partners—in London itself (Memorandum of Sir Henry Thring in Appendix to Report from the Select Committee of the House of Commons on Banks of Issue, 1875). The London and Westminster Bank, established 1834, was the first joint-stock bank founded in London. Since that time the application of the joint-stock principle has greatly extended. No new private bank has been established for many years, and nearly all those which were in existence had by 1911 amalgamated with joint-stock banks. The limitation of the liability of the shareholders to the amount of their subscription was not permitted till the failure of the City of Glasgow Bank and the Western Bank of Scotland in the year 1878 called attention to the subject, and the act of 1879 was passed by the intervention of Sir Stafford Northcote, afterwards Earl of Iddesleigh. In 1912 practically all the joint-stock banks of the United Kingdom were 'limited.'

In Scotland different laws prevailed, and joint-stock banks were established far earlier than in England. The stability of the system in Scotland was greatly promoted by the provision of the law which declared that 'there is no limitation upon the number of partners of which a banking company may consist' (Report of the Committee of the House of Commons appointed in 1826 to consider the expediency of abolishing all notes under £5). The oldest of the Scottish banks is the Bank of Scotland, which dates from 1695. Other joint-stock banks followed gradually. All the private banks, some of which were of very high standing, had ceased business by 1844. The numbers of the joint-stock banks have during the last hundred years or so greatly diminished through amalgamations. In 1819 there were thirty-six separate banks in Scotland, including eight private banks. In 1911 there were only ten banks, eight possessing the right of issue, all on the joint-stock principle. In Scotland the establishment of branches, not only in small towns, but even in villages, has been carried out much more extensively than in England. The power of issuing notes which provide 'till money' economically has greatly assisted in this.

The acts of 1844-45 permit the banks which have the privilege of the note circulation in Scotland and Ireland to issue notes beyond the limit fixed by those acts, provided they hold specie—principally gold coin—to a corresponding amount. A certain latitude in time is allowed the banks to obtain the specie which has to be held in Scotland and Ireland. The Scottish banks are frequently £4,000,000 or £4,500,000, and the Irish banks about £1,000,000, above their limits. The specie held is not specially ear-marked as security for the excess issue. It is required, in pursuance of the theory on which Peel's bank acts were based, that the issue of notes affected prices, a theory at no time tenable, and now absolutely out of date.

The law regulating banking in Ireland has corresponded very closely with that in force in England. There are two private banks now in Dublin, and nine joint-stock banks carrying on

business generally in Ireland. All these banks except three are banks of issue, and all except the Bank of Ireland, founded in 1783, have been established since 1824. It speaks well for the careful management of the business that in Ireland alone, out of the three divisions of the country created by Peel's acts of 1844-45, has the limit for the note circulation remained unaltered. The arrangements for the note circulation are in their main features similar to those in force in Scotland.

A very well-arranged banking-system exists in Canada. The law governing the circulation of notes secures their being paid in hard cash not only at the bank itself and its branches, but also in important representative cities of the Dominion, as Toronto, Montreal, Halifax, and others. Their security is maintained by their not being allowed, in a general way, to exceed the amount of the unimpaired paid-up capital, by their being made a first charge on the assets of the bank, by the liability of each shareholder for double the amount of his holding, and, further, by a guarantee fund called the 'circulation fund,' which each bank has to maintain. This guarantee is collective from all the issuing banks of the Dominion. Secured thus, the notes of all the chartered banks pass regularly, at par, throughout the whole of Canada. The system has been of the greatest service in the development of the country. As a rule a manufacturer, a merchant, or a dealer in produce keeps his account with only one bank. There are great advantages in this. The banker is able not only to form a better judgment about the advances which his customer may require, but to give his customer sound advice on the subject of his business, which is especially useful in a country with wide fields for enterprise and at present imperfectly developed.

The National Bank of Belgium exercises a powerful influence on the business of the kingdom. Its agencies (country offices) are 'institutions so peculiar in character that an explanation is advisable. They are private partnerships—*sociétés en nom collectif*, "the title of the firms comprising the name of one or more of the partners, and the liability of each being unlimited." (See article on "*Sociétés Commerciales*" in Palgrave's *Dictionary of Political Economy*.) The members, or administrators, of these firms are approved by the bank. They are responsible for the due payment of the bills discounted by them. They do a large business.'

The banking laws of the United States prohibit the establishment of offices, other than the head-office of a bank, except within the limits of the municipality. This explains the great number of banks in that country. See also CLEARING-HOUSE, SAVINGS-BANKS.

Bankipur, or PATNA CIVIL STATION, a suburb of Patna (q.v.).

Bankruptcy, or **INSOLVENCY**, is the state of a person who is declared by the competent tribunal unable to pay his debts. There is no common law of bankruptcy in England, the whole law upon the subject being statutory. In England insolvency is a term which had, until the distinction was abolished in 1861, been confined to the case of a non-trader who was unable to pay his debts. All who were 'traders' were said in the same circumstances to be, not insolvent, but bankrupt. Different courts, called the Bankruptcy and the Insolvent Courts, were concerned respectively with these two great divisions of mankind, traders and non-traders. In the case of traders, the Court of Bankruptcy was the court to which they or their creditors applied. That court, whenever a trader committed an 'act of bankruptcy,' on the application of a creditor took possession of his pro-

perty and assets of every kind, converted these into money, and distributed the proceeds impartially among the creditors, according to certain rules, at the joint expense of the creditors. In the course of doing this, the court required the bankrupt to state what property he had, where it was, and to give explanation of what had been lately lost; and it was a crime for him to conceal or make away with any part of his property to the prejudice of an impartial distribution. The creditors had to show their title to a share by 'proving' their debts. In this way the debtor was entirely stripped of everything (with a few trifling exceptions) which he had, and which was saleable; but he then received a certificate which entirely cleared him of the encumbrance of his past debts for ever, and enabled him to begin the world anew.

The non-traders fell under the care of the Insolvent Court. These petitioned the court voluntarily, instead of their creditors doing so, as in the Bankruptcy Court, and of course put off their application to the last, when they were probably already in prison for debt. The sole condition on which the Insolvent Court granted them its protection and discharged them from prison was that they should not only give up all their property, but state fully all the debts and liabilities they had incurred. If they did this satisfactorily, the court relieved them from imprisonment, but did not entirely free them from debt; for if ever they should in future become rich enough to pay twenty shillings in the pound, they were still held liable to make up that amount. This contingency, however, seldom happened, and, moreover, when it did happen, considerable leniency was shown to the debtor; so that practically both in bankruptcy and insolvency the debtor was discharged, and was at least saved from imprisonment.

The bankruptcy laws date from the time of Henry VIII., and the insolvency laws from the time of Elizabeth, and the above distinction was kept up between them till the statute of 1861, which abolished the Insolvent Court. Important changes were made by the act of 1869, which repealed prior enactments and rendered the law more uniform, by applying it equally to traders and non-traders. The act of 1869 was repealed by the Bankruptcy Act, 1883, and this in its turn, after being amended by the Bankruptcy Act, 1890, the Bankruptcy and Deeds of Arrangement Act, 1913, and certain other statutes of lesser importance, was repealed by the Bankruptcy Act, 1914, which, together with the bankruptcy rules made by the Lord Chancellor under the authority given for that purpose by the act, now forms the English code upon the subject.

As the law now stands, the High Court is the Court of Bankruptcy for the metropolitan district, a High Court judge being nominated by the Lord Chancellor to take bankruptcy business. Outside London, the County Court judges exercise bankruptcy jurisdiction in their various districts. An appeal lies in bankruptcy matters from the High Court to the Court of Appeal, and thence, with leave, to the House of Lords. From the County Courts the appeal is to a Divisional Court of the High Court, and thence, with leave, to the Court of Appeal, but no farther. The bankruptcy registrars (whose duties outside London are performed by the County Court registrars, in addition to their other functions) occupy an important position in bankruptcy administration. They hear petitions, make adjudications in bankruptcy, hear the public examination of the bankrupt, and in London approve compositions and grant discharges; in the County Court these last two functions can only be performed by the registrar when there is no opposition from creditors or other persons. Over the whole

of the bankruptcy administration the Board of Trade exercises a general superintendence, and presents annually to parliament a report and statistics which cover the whole field of the subject.

The 'debtor' who may be made bankrupt under the act of 1914 includes any person, whether a British subject or not, who at the time when any 'act of bankruptcy' was done or suffered by him (a) was personally present in England, (b) ordinarily resided in England, (c) was carrying on business in England, personally or through an agent or manager, or (d) was a member of a firm or partnership carrying on business in England. Under the act of 1883 a foreigner could only be made bankrupt in respect of acts committed in England; nor could a principal abroad be made bankrupt by reason of an act of bankruptcy committed in England by his agent or manager. Special rules still apply to certain classes of debtors. A married woman can only be made bankrupt if she carries on a trade or business; but it is no longer necessary that she should carry it on separately from her husband. An infant, whose contracts are not, as a rule, binding on him, cannot be made bankrupt in respect of liabilities incurred on such contracts; where, however, the contract is binding (such as a contract for the supply of necessities), there seems to be no reason for granting the infant exceptional treatment. The better opinion is that a lunatic can be made a bankrupt; so also can a convict who is undergoing imprisonment. There are special rules in the Companies Acts relating to the winding up of limited companies; but an ordinary partnership comes under the general law, as does also a limited partnership, subject to any modifications which may be made by rules under the act.

The acts or defaults which render a debtor liable to be made bankrupt are called technically 'acts of bankruptcy.' These are (1) assignment of property to trustees for the benefit of creditors; (2) fraudulent assignment of property; (3) fraudulent preference of creditors; (4) departing from England, remaining abroad, or keeping house with intent to delay or defeat creditors; (5) suffering an execution to be levied on his goods; (6) presentation of a bankruptcy petition by the debtor against himself; (7) non-compliance with the requirements of a bankruptcy notice; (8) notice to creditors that he is, or is about to become, insolvent. A debtor is also deemed to have committed an act of bankruptcy when a judgment creditor applies for his committal to prison for non-payment of a judgment debt, and the court, in lieu of committal and with the consent of the creditor, makes a receiving order against him. Of all these acts, non-compliance with the requirements of a bankruptcy notice is the commonest foundation for a petition, because a creditor may in that case himself compel the commission of the act of bankruptcy, and so force the debtor to become bankrupt. A bankruptcy notice is a notice which requires the debtor to pay a judgment debt within a specified period, and failure to pay or compound to the creditor's satisfaction constitutes an act of bankruptcy, of which any creditor may take advantage.

A creditor cannot present a bankruptcy petition against a debtor unless (a) the debt, or, if two or more creditors join in the petition, the aggregate amount of debts owing to the several petitioning creditors, amounts to £50; (b) the debt is a liquidated sum; (c) the act of bankruptcy alleged occurred within three months of the presentation of the petition; and (d) the debtor is domiciled in England, or within the preceding year has ordinarily resided or had a dwelling-house or place of business in England, or (except in the case of a person domiciled in Scotland or Ireland, or a partnership with its principal place of business in Scotland or Ireland)

has carried on business in England, personally or through an agent or manager, or (with the same exceptions) has been within that period a member of a partnership carrying on business in England through a partner, agent, or manager. The petition must be verified by affidavit. A secured creditor must state his willingness to give up his security for the benefit of the creditors at large, or he must estimate its value and petition in respect of the unsecured balance only. A petition once presented can only be withdrawn by leave of the court. The court has a general discretion in granting the petition, and will not necessarily do so, even should the creditor duly prove his debt, if for any reason it appears that the proceedings are not *bona fide*, or that bankruptcy will result in no appreciable benefit either to debtor or to creditors. If, however, there is no ground for departing from the usual course, a 'receiving order' is made, the effect of which is to put the official receiver temporarily into possession of the debtor's estate pending a final adjudication. The debtor then files a statement of his assets and liabilities, and has to submit himself to a public examination, at which he may be questioned, not only by the official receiver, but by any creditor. Within a short period of the receiving order, the creditors meet and decide whether they shall make the debtor bankrupt or accept any scheme of arrangement which he may put before them. The latter requires the consent of a majority in number and of three-quarters in value of the creditors and also the approval of the court, which in certain cases cannot be given unless the conditions specified in the acts are fulfilled, and can in no case be claimed as of right. A receiving order may be rescinded if the court is satisfied that the case can be more conveniently dealt with by Scottish or Irish bankruptcy proceedings or for other good cause—for example, if the debtor pays his debts in full.

If the creditors decide upon bankruptcy, the debtor is forthwith adjudicated bankrupt, and the same result follows if the creditors either do not meet or pass no resolution at their meeting. The official receiver then becomes trustee of the assets, and therefore legal owner of them, until such time as the creditors appoint a trustee. Failing appointment by the creditors, a trustee is selected by the Board of Trade, who commonly appoint the official receiver. A trustee appointed by creditors gives security to the satisfaction of the Board of Trade, and may be advised by a committee of inspection, also appointed by the creditors, usually from among their own number. Certain powers of the trustee cannot be exercised without the consent of this committee, or, if no committee has been appointed, of the Board of Trade. The trustee may be removed by resolution of the creditors, or, in the event of misconduct or physical incapacity, by the Board of Trade. He is remunerated by commission on assets realised and dividends paid, and is entitled to an indemnity out of the estate for his proper expenses. All moneys received by the trustee are to be paid into the bankruptcy estates account at the Bank of England; though, with the permission of the committee of inspection and of the Board of Trade, an account may also be opened at a local bank.

All property of the bankrupt which he had at the date of bankruptcy or acquired at any time before his discharge vests, as a general rule, in the trustee, except trust property, the tools of the debtor's trade, and bedding and wearing-apparel of himself and his family to the amount of £20. But a bankrupt who disposes of after-acquired property to another person for value can give a good title, provided the transferee had no knowledge of any claim by the trustee; the transferee being in such

a case protected against a subsequent demand from the trustee. Nor do the personal earnings of the bankrupt pass to his trustee, or damages awarded the bankrupt in respect of a personal tort—e.g. a libel published concerning him. The court may, however, require the debtor to set aside a certain portion of his earnings for the benefit of his creditors. In the event of a second or subsequent receiving order being made against the same bankrupt, any property acquired by him since the last adjudication which has not actually been distributed among the creditors vests in the trustee in the subsequent bankruptcy, debts still unsatisfied under the former bankruptcy being provable by the trustee in the subsequent proceedings. But apart from these exceptions, the trustee can claim the whole of the debtor's property of every kind, whether real or personal. His rights in this respect are, moreover, enlarged by reason of the doctrine of 'relation back.' His title is held not to begin with the bankruptcy, but to relate back to the date of the first act of bankruptcy occurring within three months of the presentation of the petition. Fraudulent dispositions by a bankrupt on the eve of bankruptcy are thus nullified, because the transferee (unless he had no knowledge of any available act of bankruptcy) has no answer to the claim of the trustee to the property assigned, in the event of bankruptcy ensuing. The trustee can also take steps to get set aside certain other transactions by the debtor. Assignments in fraud of creditors are void against the trustee (subject to the rights of *bona fide* purchasers for value), and so also are assignments which constitute a fraudulent preference of one creditor over another. Voluntary settlements within two years of bankruptcy are similarly void, and even within ten years, unless in the latter case it can be shown that the bankrupt was fully solvent at the time when the settlement was made. In one case goods which do not belong to the bankrupt at all may nevertheless pass to his trustee—viz. goods which are in the 'possession, order, or disposition' of the bankrupt, in his trade or business, with the consent of the true owner, in such circumstances that the bankrupt is the 'reputed owner' of them. The object is to prevent a trader obtaining credit on the strength of goods which do not in fact belong to him; and the true owner of the goods who enables credit to be so obtained must be taken to know the risk which he runs by giving the trader possession of them.

With regard to the claims of creditors against the debtor's estate, the rule is that every liability of the debtor is provable, except a demand for unliquidated damages not founded on contract or breach of trust. Where there have been mutual dealings between a creditor and the debtor, the former may only prove for the balance of account. The trustee has the right, however, to disclaim property to which onerous burdens are attached—such as shares not fully paid, leaseholds, or contracts likely to result in loss. Parties prejudiced by such action on the part of the trustee may prove for their loss with the other creditors. Disclaimer must take place within twelve months of the trustee's appointment, unless any person interested in the property calls upon the trustee to decide whether he will disclaim or not; in which case the trustee must make up his mind in twenty-eight days. Certain debts must be paid preferentially; among these are rates and taxes, Insurance Act contributions, payments not exceeding £100 under the Workmen's Compensation Act, and wages of clerks, servants, and workmen, for a period and amount not exceeding four months and £50 respectively. On the other hand, a wife who lends money to her husband for the purposes of his trade can only prove after the claims of all other creditors for value have been satisfied. Secured creditors may

either content themselves solely with their security, or may prove for the deficiency of their debt over the value of the security, or may give up their security and prove for the whole debt. If a secured creditor puts a value on his security and proves for the balance, the trustee may redeem for the amount at which the creditor has estimated the value.

The first dividend is to be paid within four months of the first meeting of creditors, and subsequent dividends at intervals of not more than six months. The bankrupt is bound throughout the administration to assist in every way the discovery and realisation of his property, and he may be arrested if there is reason to believe that he is going to defeat these main objects of the bankruptcy. The court has also power to examine any one suspected of having the debtor's property, or being indebted to him, or of being able to give information about the estate.

The bankrupt may at any time after adjudication apply for his 'discharge'; and it may here be observed that, apart from this, the court has at all times, on sufficient cause being shown, the power to annul altogether any adjudication; though this is not often done. A 'discharge' operates as a release of the bankrupt from substantially all his liabilities, and enables him to begin again with a clean sheet. Liabilities, however, in respect of debts due to the Crown (unless the Treasury consent), or in respect of fraud or fraudulent breach of trust, or under a judgment as co-respondent in a divorce suit or in an action for seduction, or under an affiliation order, are not released by a discharge. In certain cases a discharge must be refused—e.g. if the bankrupt is guilty of any criminal offence (of which a variety have been created by the Bankruptcy Acts) in connection with the bankruptcy or the conduct of his business during the period immediately preceding it; in others the court is bound to impose conditions, if it does not refuse the discharge altogether. This is the case where the assets are not equal to ten shillings in the pound (unless the bankruptcy is wholly due to misfortunes beyond the debtor's control), or proper books of account have not been kept, or bankruptcy has been caused by hazardous speculation. It is a common practice in such circumstances to suspend the discharge for a period of years, or to make it conditional on the bankrupt consenting to judgment being entered against him for a certain sum. An undischarged bankrupt who obtains credit for more than £10, or engages in any trade or business under a name other than that under which he was adjudicated bankrupt, without disclosing the fact of his bankruptcy is guilty of a misdemeanour. With regard to offences which the investigation of the bankrupt's affairs shows that he has apparently committed, all bankruptcy courts have power to commit the bankrupt for trial. Statements made by the bankrupt in the course of his public examination are admissible in evidence against him upon his trial for such offences.

Bankruptcy operates as a disqualification for public offices of all kinds. No bankrupt may sit or vote in either House of Parliament, and a seat in the House of Commons is vacated six months after adjudication, unless the court certify that the bankruptcy was due to misfortune only and not to any misconduct on the bankrupt's part. So also no bankrupt can sit on any local council, or hold office as mayor or alderman, or be made a justice of the peace. Discharge releases the bankrupt from these disqualifications if the bankruptcy is certified to be due to misfortune; in other cases it continues to exist for five years.

The act of 1914 also contains important provisions in regard to small bankruptcies, where the property of the debtor is not likely to exceed

£300. In such cases the official receiver becomes trustee; there is no committee of inspection, and the procedure is more summary. And where judgment has been obtained in the County Court against a debtor who is unable to pay the judgment debt, but whose total indebtedness is less than £50, the County Court may administer his estate and make an order for payment for his debts by instalments. The act also provides for the administration in bankruptcy of the estates of persons dying insolvent, which could formerly only be carried out by a suit in Chancery. The Chancery Court may now transfer to the Court of Bankruptcy all proceedings for administration which have already been begun in Chancery, or proceedings may be begun in the Court of Bankruptcy in the first instance. Substantially, the administration is upon the lines already described, with the necessary adaptations; but no proof of an act of bankruptcy committed by the deceased within three months of his death is necessary. It is sufficient if the court is satisfied that there is no reasonable probability of the estate being able to discharge its liabilities.

It is sometimes more advantageous and convenient for creditors to accept an assignment of the debtor's property or to make a composition with him without recourse to bankruptcy proceedings. Such arrangements are dealt with by the Deeds of Arrangement Act, 1914, which consolidates earlier enactments on the subject. Provision is made by the act for the protection of dissentient creditors, who are given the option of deciding within a certain period whether they will force a bankruptcy. The deed of arrangement must be registered in order to be valid. The trustee must give security to the court, and is generally subject to the supervision of the court and the Board of Trade in his management and distribution of the debtor's assets for the benefit of the creditors.

In Ireland the code of bankruptcy differs largely from that in England and Scotland. It consists of the Irish Bankrupt or Insolvent Act, 1857; the Debtors (Ireland) Act, 1872; the Bankruptcy (Ireland) Amendment Act, 1872; and the Local Bankruptcy (Ireland) Act, 1888. The first of these statutes contains 410 sections and 26 schedules, which were largely modified in 1872. The general principle is that of adjudication in the Court of Bankruptcy, the estate being taken by official assignees, who act along with an assignee afterwards appointed by the creditors, and are paid by a percentage on realisation. Since 1872 the law is applicable to traders and non-traders alike. In 1888 local bankruptcy courts were created, which administer bankrupt estates in substantially the same way as the High Court. In all cases compositions may be sanctioned by three-fifths in number and value of the creditors, and under the act of 1872 winding up by a trustee and committee of inspection was introduced. Imprisonment for debt was abolished in 1872, and new provisions introduced for the punishment of fraudulent debtors.

The creation of the Irish Free State involves the establishment of separate bankruptcy jurisdictions in Northern and Southern Ireland, and the Parliaments of the Free State and of Northern Ireland will in future each have power to legislate in bankruptcy matters.

It is to be observed that the Bankruptcy Act, 1883, requires that all English, Scottish, and Irish bankruptcy courts are to execute the orders of one another, and all British courts, whether in the United Kingdom or elsewhere, which exercise bankruptcy jurisdiction are to act in aid of, and auxiliary to, each other. Proceedings in England may also be dismissed or stayed if it appear that it would be more convenient that the bankruptcy administration should take place in Scotland or Ireland.

In Scotland the estate of a bankrupt is realised and distributed among his creditors in a process of sequestration. Where the estate is small, it is wound up by a process of 'summary sequestration,' which has been substituted for the former process, known as *cessio bonorum*. From the time that a debtor becomes insolvent—i.e. unable to pay his debts in full—the common law seeks to protect the interests of his creditors by imposing checks on his power of dealing with his property. These common law checks are rendered more effective by the act 1621, c. 18, which strikes at alienations of his property by an insolvent debtor, without onerous consideration, to near relatives or persons standing to him in a confidential relation; and by the act 1696, c. 5, which renders void voluntary dispositions of property by a debtor in favour of creditors for their satisfaction or further security, granted within sixty days of his becoming 'notour bankrupt.' The state of notour bankruptcy exists from the time that a person's insolvency is publicly known by reason of certain proceedings corresponding to what are called in England acts of bankruptcy. A debtor in this position is liable to sequestration, ordinary or summary, at the instance of his creditors.

The process of sequestration, which is regulated by the Bankruptcy (Scotland) Act, 1913 (3 & 4 Geo. V. c. 20), which came into operation on January 1, 1914, is similar in most respects to the corresponding process in England; but there are some differences of no small importance. The first step is a petition for sequestration, which may be presented either in the Court of Session or in the Sheriff Court. The petition may be presented by the debtor himself, with the concurrence of creditors; or, if the debtor is notour bankrupt, by one or more creditors whose debt or debts together amount to not less than £50, provided such debts are not contingent. The ordinary—not the summary—process of sequestration is also available where a person has died insolvent, and in that case the application may be made either by creditors in debts of the amount above mentioned, or by some one whom the deceased had authorised to apply. The deliverance awarding sequestration appoints a meeting of creditors for the election of a trustee, and, pending that election, the court has power to take measures for the preservation of the debtor's estate by the appointment of a judicial factor or otherwise. The trustee's election is confirmed by the Sheriff, who issues a statutory order, known as the 'act and warrant,' which constitutes the trustee's title to the sequestered estate, and has the effect of divesting the bankrupt of all property, heritable or movable, in which he has a beneficial interest, and vesting it in the trustee. The creditors also elect commissioners, who advise and assist the trustee in the management of the estate and fix his remuneration. It is the duty of the bankrupt to produce a full statement of his affairs, to appear for public examination in the Sheriff Court, and to grant any deeds necessary for the recovery and realisation of the estate. To entitle a creditor to vote, or to draw a dividend, he must produce an oath or affidavit to the verity of his debt, and the account and vouchers necessary to prove it. These claims are adjudicated on by the trustee, who pronounces a deliverance in writing on each claim, rejecting, admitting, or requiring further evidence in support of it. A claim may be ranked as preferable, or ordinary, or contingent, or postponed. Domestic servants have a preference for their wages for the term current at the date of sequestration; clerks, shopmen, and other servants, to the extent of four months' wages; and workmen, to the extent of two months' wages. The bankrupt, on obtaining a report by the trustee on his conduct, may apply

to the court for his discharge in the course of the sequestration at various periods, dependent on the proportion of creditors who concur. The court may refuse the application if the bankrupt has fraudulently concealed any part of his property or wilfully failed to comply with any of his statutory duties; and where less than 5s. in the £1 has been paid, a discharge is not granted unless it is shown that the failure to pay that amount arose from circumstances for which the bankrupt is not responsible. A sequestration may also be brought to an end and the bankrupt obtain his discharge by the creditors, with the approval of the court, accepting an offer of composition made by the bankrupt or his friends. In the event of the composition not being paid, the original debts do not revive; and if the debtor is again sequestered, the creditors in the former sequestration can rank only for their composition claims, so far as unpaid. There are also powers of winding up the estate under a deed of arrangement. The Court of Session may recall a sequestration where, from the situation of the assets and the residence of the majority of the creditors, it appears that the distribution ought to take place in England or Ireland.

The process of summary sequestration was introduced by the Bankruptcy Act of 1913 in place of the former process of *Cessio Bonorum* (q.v.). It is available where the assets of the debtor's estate do not in the aggregate exceed £300 in value. The procedure, which is regulated by secs. 175 and 176 of the act of 1913, is cheaper and more expeditious than that in an ordinary sequestration. It is not competent in the case of a deceased debtor.

In Scotland the accountant of court has important powers and duties of supervision in bankruptcies. He keeps a register of sequestrations and a register of unclaimed dividends, and also makes an annual report to the Court of Session showing the state of each depending sequestration.

See Williams, *Law and Practice in Bankruptcy* (9th ed. 1908); Baldwin, *Law of Bankruptcy* (10th ed. 1910); Wace, *Law and Practice of Bankruptcy* (ed. 1904); Ringwood, *Principles of Bankruptcy* (10th ed. 1908); Robb, *Law and Practice of Bankruptcy in Ireland* (ed. 1907); Goudy, *The Law of Bankruptcy in Scotland* (4th ed. by Fyfe, 1914); Wallace, *Law of Bankruptcy in Scotland* (1914); and for the United States, the manuals by Bump (11th ed. 1898) and Brandenburg (2d ed. 1901).

Banks, SIR JOSEPH, born in London, 13th February 1744, and educated at Oxford, in 1766 made a voyage to Newfoundland, collecting plants; and in 1768–71 he accompanied Cook's expedition round the world in a vessel equipped at his own expense. In 1772 he visited the Hebrides and Iceland. In 1778 he was elected President of the Royal Society, an office which he held for forty-one years; in 1781 he was created a baronet, and in 1802 a member of the French Institute. He died 19th June 1820. His services to Australia can hardly be overrated. He was assiduous in urging that the first settlement in New South Wales should be made; he helped to appoint the early governors; he encouraged the explorers, both by land and by sea; he aided the early settlers with live-stock, plants, expert advice, and money. 'To him more than to any other man it is due that the English colony took firm hold on the soil of New South Wales.' He founded also the African Association. Through his efforts the bread-fruit tree was transferred from Tahiti to the West Indies, and the mango from Bengal, as well as many of the fruits of Ceylon and Persia. Many naturalists and travellers were indebted to him for zealous assistance. Some articles excepted, Banks wrote nothing but *A Short Account of Blight, Mildew, and Rust* (1805); *Circumstances relative to Merino Sheep*

(1809); and his *Journal* during Cooke's first voyage, edited by Hooker in 1896. He bequeathed his library and a rich collection of specimens to the British Museum. See a book on him as 'a father of Australia' by J. H. Maiden (1910), and a *Life* by E. Smith (1911).

Banks, NATHANIEL PRENTISS, American politician and soldier, was born in Massachusetts, 30th January 1816. At first a factory-worker, he studied law, and became successively a member of the state and the national legislatures. He was Speaker of congress in 1856, and in 1857, 1859, and 1861 was elected governor of his native state. In the Civil War he took a command in the army, at first on the Potomac, then at New Orleans, and finally on the Red River. He re-entered congress as a republican in 1864, was long chairman for foreign relations, and died 1st September 1894.

Banks, THOMAS (1735-1805), sculptor, born in Lambeth, was apprenticed to an ornament-carver, and in 1763 gained a medal for a bas-relief from the Society of Arts, in 1770 the gold medal of the Royal Academy. In 1772-79 he was in Rome, but on his return to London his refined imaginative style was little appreciated. In 1781 he visited Russia.

Banksia, a genus of the Australian order Proteaceæ (q.v.), named in honour of Sir Joseph Banks. Most of the species are shrubs, but a few become small trees. They have hard dry leaves, generally white or very pale green beneath, and present a remarkable appearance from the peculiar arrangement of their branches, which bear towards their extremities oblong heads of very numerous

Banksia :

A, shoot; B, single flower enlarged; C, in section.

flowers. The flowers secrete much honey. Some of the species are now frequent ornaments of green-houses in Britain. They are abundant in all parts of Australia, forming, indeed, a characteristic feature of its vegetation, and are called Honey-suckle trees. *B. grandis*, found at Swan River, exceeds all the rest of the genus in size, being said occasionally to attain a height of 50 feet.

Banks Land, an island in the west of Arctic America, discovered by Parry in 1819, explored by Macure in 1850, and named by him Baring Island. It is separated by Banks Strait from Melville Island, lying to the north-east, and by Prince of Wales Strait from Prince Albert Land (Victoria Island), lying eastward.

Bankura, a town, capital of a district in Bengal, on the north bank of Dhalkisor River. It is a healthy place, with a trade in ice, oil-seeds, cotton, and silk. Pop. 25,000.—The district, in Bardwan division, Bengal, has an area of 2621

sq. m.; pop. (1911) 1,138,670, over 90 per cent. of whom are Hindus.

Bann, two rivers in the north-east of Ireland—the Upper Bann, flowing into, and the Lower Bann, out of Lough Neagh. The Upper Bann rises in the Mourne Mountains, and runs 25 miles NNW. through the counties of Down and Armagh. The Lower Bann, strictly the continuation of the Upper, issues from the north-west corner of Lough Neagh, and flows 40 miles NNW., through Lough Beg, dividing the counties of Antrim and Londonderry. It runs past Coleraine, into the Atlantic Ocean, 4 miles SW. of Portrush. It has important salmon and eel fisheries. Vessels of 200 tons can reach Coleraine by the river, 4 miles from the ocean.

Bannatyne Club, a literary club deriving its name from George Bannatyne (1545-1608), a native of Forfarshire, and Burgess of Edinburgh, to whose manuscript, compiled during the pestilence of 1568, we are indebted for the preservation of much of the Scottish poetry of the 15th and 16th centuries. The Bannatyne Club was instituted in Edinburgh in 1823 by Sir Walter Scott, with the assistance chiefly of David Laing of the Signet Library, Archibald Constable, and Thomas Thomson. Its object was to print rare works illustrative of Scottish history, topography, poetry, miscellaneous literature, &c., in a uniform and handsome manner, either at the expense of the club, or as the contributions of individual members. The club originally consisted of 31 members only, who paid an annual contribution of five guineas; but, owing to the anxiety of many eminent men to become members, the number was gradually extended to 100. Its first president was Sir Walter Scott, who was succeeded by Thomas Thomson, and Lords Cockburn and Rutherford; and its first secretary was David Laing, who continued to its close to discharge the duties of the office. The club, which had its annual—and apparently rather convivial—meetings in December, was dissolved in 1861, having printed 116 works. A complete set was sold in 1887 for £235, and one in 1905 for £139. The Bannatyne MS. (from which Allan Ramsay extracted most of his *Evergreen*) was published in full by the Glasgow Hunterian Club in eight parts (1874-86).

Banner, a term sometimes loosely used to signify any military ensign or standard (see STANDARD), but in a more strict sense denoting a square flag charged with the coat of arms of the owner. The banner was borne by sovereigns, princes, barons, and bannerets, and served as the ensign both of the owner of it and of his retainers and followers. It differed from the pennon not only in being square and not pointed, but in bearing only the owner's arms, and not his badge or device; and therefore the pennon of a newly made Banneret (q.v.), though intended to represent a banner, was not exactly one. The royal standard of the United Kingdom, and the cavalry standards in use in the army, are in strictness banners. See the article FLAG.

Banneret, a higher grade of knighthood conferred by the sovereign for some heroic act performed in the field, and so called because the pennon of the knight was then exchanged for the banner—a proceeding which was effected by the sovereign on the field of battle standing beneath his own royal standard displayed, and tearing off the points of the pennon so as to give it the requisite square shape of the banner. The Roll of Caerlaverock contains an enumeration of 87 bannerets, including the king himself, 11 earls, and the Bishop of Durham, as present in the campaign of Edward I. in Scotland in 1300. During the reign

of Elizabeth, the degree of banneret was allowed to die out in England; but it was revived in 1642, when Colonel John Smith, who recovered the royal standard at Edgehill, had that dignity conferred on him by Charles I. Sir John Smith was properly the last knight-banneret made in England; for, though George III. bestowed the title on Sir William Erskine in 1764, and on five naval officers in 1773, the proceeding was considered irregular, as the ceremony was performed at a review, and not in actual warfare; and the rank of the recipients of the honour was therefore not generally recognised.

As occupying a rank intermediate between barons and ordinary knights, bannerets have sometimes by an etymological misapprehension been styled 'baroneti' instead of 'bannereti.'

Bannock, a cake of home-made bread, common in Scotland and the north of England. It is usually composed of pease-meal or of pease and barley meal mixed; prepared without any leaven, it is baked on a circular plate of iron, called a giddle. When made of mixed meal, it is often called a *mashtum bannock*. 'Bannocks of barley-meal' form the theme of a popular Scottish song. The word bannock is from the Gaelic *bannach*, 'a cake.'

Bannockburn, a Stirlingshire village of 3000 inhabitants, 3 miles SSE. of Stirling, on the Bannock Burn, a little affluent of the Forth. It is an important seat of the woollen manufactures, especially of carpets and tartans. Tanning is carried on to some extent, and the neighbouring villages are noted for the manufacture of nails; whilst coal abounds in the vicinity. In the great battle of Bannockburn, fought on Monday, 24th June 1314, Robert Bruce, with 30,000 Scots, gained a signal victory over Edward II., with 100,000 English, and secured his throne and the independence of Scotland. The English are said to have lost 30,000, and the Scots 8000 men. The 'Boie Stone,' on which Bruce is said to have fixed his standard on that eventful day, is still to be seen on an eminence; and near it is a flagstaff, 120 feet high, erected in 1870. Not far off was fought the battle of Sauchieburn. See SCOTLAND, BRUCE, Lang's *History of Scotland*, vol. i. (1800), and books by Mackenzie (1913) and Morris (1914).

Banns, one of three alternative preliminaries to the legal celebration of marriage in England, the other two being episcopal license and a registrar's certificate. Banns of marriage, like many of our ecclesiastical regulations, have their origin in the ancient practice of the Roman Catholic Church, which our reformers wisely refrained from abolishing. By the publication of these banns is meant the legal proclamation or notification within the parish, district, or chapelry, and in the proper church or chapel, of the names and descriptions of the persons who intend to be there married; the object being that all who have objections to the marriage may be enabled to state them in time. If the bridegroom live in a different parish from the bride, the banns must be proclaimed also in that parish, and a certificate of such proclamation must be produced before the celebration of the marriage. According to the old English canon law, the publication of banns might be made on *holidays*; but a change was made to *Sundays* by Lord Hardwicke's Marriage Act in 1753, and although that act was afterwards superseded by the 4 Geo. IV. chap. 76, the regulation as to Sundays has been since continued. Seven days' notice at least must be given to the clergyman before publication of banns. Banns are to be published in an audible manner, according to the rubric prefixed to the marriage-service in the *Book of Common Prayer*, upon three Sundays preceding the ceremony, during the time of morning-service, or of evening-service (if on the day of

publication there shall be no morning-service) immediately after the second lesson. Marriages celebrated without publication of banns, or license, or a registrar's certificate, are null and void. By the Marriage Act of 1836, the bishop may license chapels for the celebration of marriages in populous places; and by 1 Vict. chap. 22, banns may be published in such chapels. If the marriage be not celebrated within three months after publication of banns, the marriage shall not take place until the banns shall have been republished on three several Sundays, unless it be a marriage by license, or now, by certificate, which two latter alternatives, however, must also be availed of within the three months.

The purpose of the law is to secure public knowledge of intended marriages, and therefore it is not necessary that such publication should be made in the real baptismal names of both or either of the parties; it is sufficient that the banns be published in the names by which the parties are *known*, or either of them. But if either of the names used be false, to the knowledge of *both* parties, the marriage is void. As the publication of banns invites people to object, if the parent or guardian express dissent, it is the duty of the clergyman, when such objections are offered, to proceed no further; and if he marry a minor, notwithstanding such dissent, he will be liable to severe penalties by the ecclesiastical law, though he will not be liable to an indictment. Again, on the other hand, if a clergyman of the Church of England refuse, without cause, to perform the marriage, he is liable to an action.

In Scotland, Fraser shows that banns were first sanctioned by councils which were held in that country long before the time of the Council of Trent. After the Reformation in Scotland, the practice of proclaiming banns was continued. In 1712 the privilege of publicly celebrating marriage was extended to the Scotch *Episcopalian* clergy, and in 1834 to those of other dissenting bodies. When both of the parties have their *Domicile* (q.v.) within Scotland, and enter into marriage in England or Ireland, they must have their banns proclaimed in the parish of their domicile in Scotland, otherwise they are liable to the penalties of clandestine marriage. By the Marriage Notice Act, 1878, a certificate of publication of notice of marriage may be issued by a registrar to persons resident for fifteen days in the district; the fee for registry is 1s. 6d.

The Scots law differs from the English in regard to the effect of non-publication of banns. In England, in some cases, the consequence is to render the marriage absolutely void. In Scotland, however, marriage, without proclamation of banns, is valid; but in such case the parties, celebrator, and witnesses, are liable in special penalties. See MARRIAGE; SPECIAL LICENSE; REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES.

In the United States, banns of marriage are not required in most states, having been gradually superseded by the marriage license; in some states even this is not required. Each state has entire jurisdiction over its own citizens on the subject of marriage.

Banquette, in Fortification, is a raised ledge or step inside the parapet of a rampart, of such a height that musketeers, when standing on it, may be able to fire over the crest of the parapet without too much exposure to the enemy.

Banshee, in the folklore of the Irish and Western Highlanders of Scotland, a female fairy who makes herself known by wailings and shrieks, before a death in the family over which she exercises a kind of guardianship. This notion is woven

into many folk-tales of rare pathos and beauty. A guardian spirit of the same kind occurs frequently in the folklore of Brittany. The name is supposed to be a phonetic spelling of the Irish *bean sídhe*, old Irish *ben síde*, 'woman of the fairies.'

Banswara, a state in the south-west of Rajputana. The surface is hilly, with much timber; it has an area of 1946 sq. m., and is peopled by wild and turbulent Bhils. This state was fearfully oppressed by the Mahrattas, till, in 1818, it passed voluntarily into British protection. Population (1911) 165,463.—The capital, also called Banswara, lies 8 miles W. of the Mahi River. Pop. 8000.

Bantam, a seaport, now decayed, about 61 miles W. of Batavia, in a residency of the same name, which forms the west end of Java. It occupies an unhealthy situation, on a low swampy beach. It was the first Dutch establishment in Java (1595), and the seat of government of the residency, until transferred to the more salubrious Serang, 6 miles distant, in 1816. The harbour is now much obstructed by coral-reefs and other deposits, and the trade has gone to Batavia. Pop. of residency, about 700,000.

Ban'tam Fowl (*Gallus bankiva*), a well-known variety of the common Domestic Fowl, originally brought from the East Indies, and supposed to derive its name from Bantam, in Java, though they probably came from Japan. It is remarkable for smallness and pugnacity. There are several sub-varieties. Most of them have the legs much feathered. The flesh and eggs are good. The hen lays well in winter. See POULTRY.

Banteng (*Bos sondaicus*), a species of ox, a native of Java and Borneo, resembling the Gaur (q.v.) of India. The banteng is black, with white legs; the hair is short and sleek, the limbs slender, the muzzle sharp; the back rises into a high arch immediately behind the neck. It inhabits forests, and has been generally described as untamable.

Banting System. See OBESITY.

Bantock, GRANVILLE, composer, was born in London, 7th August 1868. He gained a scholarship for composition at the Royal Academy of Music (1889), and afterwards conducted in many towns. In 1900 he became principal of Birmingham School of Music, and in 1908 professor of music in Birmingham University. His compositions include many orchestral pieces—*Atalanta in Calydon* (1912; a 'choral symphony'), *Hebridean Symphony*, &c.

Bantry, a seaport town in the south-west of County Cork, Ireland, in a cove opposite Whiddy Isle, at the head of Bantry Bay, and 44 miles WSW. of Cork. The chief trade is the export of agricultural produce. A little fishing is carried on. In last century there was an extensive pilchard-fishery here; but the pilchard has now deserted the coast. Many tourists resort to Bantry in summer. Pop. 3200.

Bantry Bay, a deep inlet in the south-western extremity of Ireland, in County Cork. It is 25 miles long, running ENE., with a breadth of 4 to 6 miles. It is one of the finest harbours in Europe, affording safe and commodious anchorage for ships of all sizes. Here a French force attempted to land in 1796. The coast around is rocky and high.

Bantu ('people'), a native word adopted for a large group of African languages, and the peoples speaking the same. The Bantu peoples occupy most of Africa from 5° N. lat. southwards, and are broadly distinguished from the Negritos and Hottentots to the south-west, and the Sudanese negroes to the north. They fall geographically into three divisions. The eastern includes Kaffirs (q.v.) and Zulus (q.v.), and extends to the Galla and

Somali country, the Swahili being the most northerly section. The central division comprises Bechuans (Basutos, Barolong, &c.). To the western division belong the inhabitants of the west coast from the Hottentot country to the Gulf of Guinea, the peoples of Benguela, Angola, Congo, Loango. The linguistic inter-relationship, as intimate as that of the Indo-Germanic family, was first recognised by Gabelentz and Pott, and afterwards elaborated by Bleek. It rests both on roots and on grammar. Within the family are included by Lepsius all the negro languages of Central Africa. See AFRICA, and Sir H. H. Johnston's *Comparative Study of Bantu and Semi-Bantu Languages* (1919-22).

Banville, THÉODORE DE, a French poet and prose-writer, the son of an officer in the French navy, was born at Moulins in 1823. His first volume, *Les Cariatides*, issued in 1841, gave him a standing as a poet among the younger members of the Romantic school, and was followed by *Les Stalactites*, *Rimes Dorées*, *Trente-six Ballades Joyeuses*, *Les Exilés*, *Les Occidentales*, *Odes Funambulesques*, *Comédies*, *Esquisses Parisiennes*, *Contes pour les Femmes*, *Contes Féeriques*, *Mes Souvenirs*, *Petit Traité de Poésie Française*, and *Dans la Fournaise* (1892). He was one of the most musical and sparkling of lyrists; one of the gayest and wittiest of parodists. The title 'roi des rimes' was given him from the graceful ingenuity with which he handled the most difficult forms of verse—the ballades, rondeaux, and rondels of the mediæval writers—which he restored to popularity in France, and which Andrew Lang and Austin Dobson, following his example, successfully introduced into English poetry. De Banville was an eloquent but hardly a discriminating critic. He died 12th March 1891.

Banyan, or **BANIAN** (*Ficus indica*), an Indian tree, remarkable for its vast rooting branches. It is a species of Fig (q.v.); has ovate, heart-shaped entire leaves, about 5 or 6 inches long; and produces a fig of a rich scarlet colour, not larger than a cherry, growing in pairs from the axils of the leaves. The branches develop pendulous adventitious roots, which soon become new stems, the tree in this manner spreading over a great surface,

Banyan Tree.

in fact almost developing into a wood, and enduring for many ages, although the original central trunk decays. One has been described as having no fewer than 350 stems equal to large oaks, and more than 3000 smaller ones, covering a space sufficient to contain 7000 persons. The tree is inhabited by great numbers of birds, fruit-bats, and monkeys, which latter consume the leaves as well as the fruit. The seeds are often deposited by birds in the crowns of palms, and send down roots which become stems

and eventually replace the palm altogether. The wood of the banyan is light, porous, and of no value; but the tree furnishes lac and caoutchouc, and the bark and milky juice are sometimes employed in Hindu native medicine. By the Brahmins the banyan is held in special reverence, as its congener the Sacred Fig, also called Peepul and Bo-tree (*F. religiosa*) by the Buddhists, so that sites of temples can be distinguished as Brahmin or Buddhist by the presence of one or other tree.—For the traders called Banyans, see BANIANs.

Banyuls-sur-Mer, a town of France in the Pyrénées Orientales, with a fishing-port on the Mediterranean, close to the Spanish frontier, 21 miles SE. of Perpignan by rail. The bathing brings many visitors in summer. Pop. 3000.

Banyumas, a town of Java. It is situated at the opening of an extensive and fruitful valley on the left bank of the Serajo, 22 miles from the south coast. Pop. 9000. It is well built, and carries on a considerable trade, is the residence of a Dutch governor, and has a fort and garrison. It is the capital of a province of the same name, which produces coffee, sugar, indigo, rice, tobacco, &c. The area of the province is 2136 sq. m.; pop. a million and a half, of whom only some 900 are Europeans. The district is low and marshy towards the coast, but very mountainous in the north and east. The volcanic plateau of Dieng (6700 feet) contains the terrible 'valley of death,' a ravine full of volcanic gases, principally carbonic acid.

Banyuwangi, a prosperous seaport town and military post belonging to the Dutch, on the east coast of Java, capital of a district of the same name, and an important station of the telegraph connecting Europe and Australia. Pop. about 15,000.

Banz, once one of the richest and most famous of the Benedictine monasteries, on the right bank of the Main, 3 miles below Lichtenfels. Founded in 1071, and destroyed in the Peasants' War in 1525, it was rebuilt, and although plundered again in the Thirty Years' War, it gradually became famed for the scientific attainments of its monks. In 1803 it was broken up, and its library and collections divided between the Munich museum and other institutions.

Baobab (*Adansonia digitata*), a magnificent tree belonging to the natural order Bombacaceæ

Baobab Tree.

(q.v.), also called the Monkey-bread Tree, is a native of tropical Western Africa, but now introduced into the East and West Indies. It is one of

the very largest trees—not rising to a great height, but exceeding almost all other trees in the thickness of its trunk (20–30 feet). Even its branches (60–70 feet long) are often as thick as the stems of large trees, and they form a hemispherical head of 120–150 feet in diameter; their outermost boughs drooping to the ground, with large horse-chestnut-like leaves, and huge white solitary drooping flowers. The fruit (called Monkey-bread) is large and woody. The pounded leaves are mixed with the daily food of the inhabitants of tropical Africa; and Europeans in that country employ them as a remedy for diarrhoea, fevers, and diseases of the urinary organs. The pulp of the fruit is pleasant and slightly acid; and the expressed juice mixed with sugar is much esteemed as a refreshing and cooling beverage, specially grateful in fevers. The bark is said to be powerfully febrifugal, and yields a very strong fibre, but the wood is soft and readily attacked by fungi.

Bapaume, a French town, department of Pas-de-Calais, 12 miles S. of Arras. Here, on the 2d and 3d January 1871, the French were defeated by the Prussians, with a loss of over 2000. It was in German hands in 1914–17 and 1918, and was wrecked. See WAR (GREAT).

Baphomet, the alleged name of a mysterious idol which the Templars were accused of worshipping. According to the oldest and most common interpretation, the word is a corruption of Mahomet, to whose faith the members of the order were accused of having a leaning. The symbol consisted of a small human figure, having two heads, male and female, and environed with serpents, the sun, and moon. Hammer, with little probability, explains the word as formed from Gr. *baphē* ('baptism') and *mētis* ('wisdom'), the Gnostic baptism—a species of spiritual illumination, which was interpreted sensually by later Gnostics, to whose licentious practices he declares them to have been addicted. According to L'Abbé Constant's *Dogme et Rituel de la haute Magie*, quoted by Littré, the word was cabalistically formed by writing backwards *tem. o. h. p. ab.*, abbreviation of *templi omnium hominum pacis abbas*, 'abbot (father) of the temple of peace of all men.'

Baptism (Gr. *baptismos*, from *baptizō*, frequentative of *baptō*, 'I dip or dye'), one of the Sacraments (q.v.) of the Christian church, deriving its name from the rite of washing with water, which forms an essential part of it. Baptism is almost universally acknowledged among Christians as a sacrament, and is referred to the authority of Christ himself, whose express command to administer it is recorded in the gospels (Matt. xxviii. 19; Mark, xvi. 16).

The name and the rite were not altogether new, however, when the ordinance was instituted by Christ. Religious meanings were early attached to washings with water, both by heathens (cf. Ovid, *Fasts*, ii. 45—

Ab, minimum facies, qui tristia crimina cædis
Fluminea tolli posse putetis aqua)

and Jews; they were among the ordinances of the Jewish law; and it is not necessary to go beyond that law to find the origin of the custom of washing or *baptising* proselytes upon their admission into the Jewish church, though we have no absolute proof of the existence of this type of baptism in pre-Christian times. Washing with water was requisite for the removal of ceremonial uncleanness, and every proselyte must have been regarded as ceremonially unclean prior to his admission into the Jewish church. John the Baptist baptised not proselytes upon their renouncing heathenism and entering the Jewish church, but those who, by birth and descent, were members of it, to

indicate the necessity of a purification of the soul from sin—a spiritual, and not a mere outward, change.

In connection with the Christian sacrament there has always been a controversy as to the proper subjects of baptism: whether it should be administered to adults only on profession of faith, or to infants as well. The baptism of adults was certainly the common practice in the apostolic age, for which an obvious cause presents itself in the fact that the first members of churches were converts from Judaism or from heathenism. It is generally held, however, by those who advocate the baptism of infants, that it was the practice of the early church to baptise the infants of Christians, on the ground of the statements in Acts, xvi. 15, 33, that whole 'households' were baptised. This again is as stoutly denied by others, who allege that infant baptism crept in along with other corruptions. For neither opinion can any positive historical proof be adduced, the arguments on both sides being mainly inferential.

The chief argument in favour of infant baptism is based upon the fact that all the Old Testament covenants included children within their scope, and provided the rite of circumcision as a seal to prove that they were the objects of the divine favour. The Christian faith, it is argued, is the fulfilment of the ancient covenant, and it is inconceivable to suppose that children were deprived of the spiritual privilege which, as the rite of circumcision shows, they possessed in pre-Christian times. Baptism obviously takes the place of circumcision in the new dispensation, and as the latter was administered to children, the former should also be administered to them. In reply to the argument that the New Testament contains no express command for infant baptism, it is urged that the *onus probandi* rests upon those who challenge the rite. The words and actions of Jesus (Mark, x. 14) may be taken as a proof that he had no intention whatever of depriving infants of the privileges which they possessed under the old covenant. On the contrary, he seems to have assigned them a higher place in the kingdom of heaven than they ever possessed in the Jewish dispensation. Though textual proof is admitted to be lacking, and it is now widely acknowledged that the general practice of the early church limited baptism to adults, it is maintained that the introduction of infant baptism is in full accord with the spirit, if not the letter, of the teaching of Jesus. For the arguments on the other side, see BAPTISTS.

It is admitted on all hands that at an early period in the history of the church baptism was administered to infants, although, even after it had been set forth as an apostolic institution, its introduction into the general practice of the church was slow. The earliest direct evidence claimed for the practice is a passage from Irenæus, who flourished in the latter half of the 2d century. Tertullian, who came a little later, looked with disfavour on infant baptism; but it was regarded by Origen (c. 185-254) as an apostolic institution. As such it was acknowledged in the North African church and in the Alexandrian and Syro-Persian churches in the 3d century; though it was not until the 5th century that it became fully established as the general practice of the Christian church. This it has unquestionably continued to be from that period to the present day, feebly opposed by some of the sects of the middle ages, and more vigorously by some Protestants. See BAPTISTS.

Both the practice and the neglect of infant baptism in the early ages of the church were connected with particular views of religious doctrine, and of the nature and purpose of baptism itself. The prevalence of the Augustinian doctrine of

Original Sin is generally regarded as a principal cause of the prevalence of infant baptism; though Pelagius, whilst opposing that doctrine, maintained the necessity of infant baptism. No little influence must be ascribed to the growing belief in the absolute necessity of baptism to salvation, and in a sort of mysterious efficacy in the rite itself. It is certain, on the other hand, that the belief in the forgiveness of sins in baptism led to a practice of deferring it as long as possible, in order that all sins might be blotted out at once. Thus the Emperor Constantine the Great was baptised only a short time before his death. The approach of a war or pestilence caused many to rush forward in haste to be baptised, who had previously delayed.

The Anglican and Lutheran churches, like the Roman Catholic, regard the baptism of infants as admitting them into the church, and making them members of Christ's body. Other Reformed churches hold that the children of Christians are included in the visible church from their birth, and therefore entitled to baptism.

Two modes of baptism are practised: by immersion or dipping, and by aspersion or sprinkling, concerning which there has been much controversy in the early period of the church's history, as well as in recent times. Affusion or pouring, the common practice of the Church of Rome, may be regarded as essentially one with sprinkling. The advocates of sprinkling universally admit the validity of baptism administered in the other mode, but the advocates of immersion generally refuse to acknowledge that baptism by sprinkling can be true Christian baptism. The opponents of infant baptism, almost without exception, insist upon immersion; whilst aspersion or affusion of water is general, except in the Eastern churches, wherever the baptism of infants prevails. The argument upon which Baptists depend most of all is that from the word baptism and the verb *baptizō*, which, in classic Greek, signifies to immerse. On the other side, it is contended that a strict limitation to this sense does not well accord with its character as a 'frequentative' form of *baptō*; and instances are adduced from the New Testament itself in which this signification cannot easily be attached either to the noun or to the verb, as 1 Cor. x. 2, where Paul says that the Israelites were 'baptised unto Moses in the cloud and in the sea;' and Heb. ix. 10, Mark, vii 4, and Luke, xi. 38, where both verb and noun are employed concerning the washings of the Jews, and the noun, even of their washing of 'cups, and pots, brazen vessels, and of tables.'

To the argument in favour of immersion derived from the phrases employed when baptism is mentioned in Scripture—as when we are told that John the Baptist baptised 'in Jordan' (Matt. iii. 6), that our Lord after his baptism 'went up out of the water' (Matt. iii. 16), that Philip and the Ethiopian eunuch 'went down both into the water' (Acts, viii. 38)—it is replied that all the passages of this description, even if their meaning were certainly as precise and full as Baptists suppose it to be, are insufficient to sustain the weight of the conclusion as to the necessity of a particular mode of baptism; that, on the contrary, it is far from being clear that these passages must be interpreted, or the meaning of the Greek prepositions so strictly defined, as the argument requires; and, further, that there are instances mentioned in Scripture which afford a presumptive argument in favour of another mode of baptism, as when we are told of great numbers being added to the church in one day, whilst there is no intimation of the converts being led to any pool or river to be baptised. To the argument drawn from the language of Paul in Rom. vi. 4, Col. ii. 12 (see BAPTISTS), it is replied

that it depends upon a fanciful interpretation of these texts. According to the advocates of baptism by sprinkling, their opponents commit the great error of attaching too much importance to the question of the mode of baptism.

It is, however, indisputable that at a very early period the ordinary mode of baptism was by immersion, in proof of which we may cite the fact that baptisteries were erected in most ancient churches. But baptism was administered to sick persons by sprinkling; although doubts as to the complete efficacy of this *clinical* baptism was evidently prevalent in the time of Cyprian (middle of 3d century). We have an interesting piece of evidence with regard to the transition from immersion to sprinkling in the time of the *Didache* (c. 100): 'Baptize . . . in flowing water. If you have not flowing water, baptize in other water. If you cannot do it in cold water, do it in warm. If neither is possible, pour it on the head thrice.' Baptism by sprinkling gradually became more prevalent; and a dispute concerning the mode of baptism became one of the irreconcilable differences between the Eastern and Western churches, the former generally adhering to the practice of immersion, whilst the latter adopted mere pouring of water on the head, or sprinkling on the face. This practice, although generally adopted in the West from the 13th century, was not universal, for it was the ordinary practice in England before the Reformation to immerse infants, and the Fonts (q.v.) in the churches were made large enough for this purpose. It continued to be the practice even till the reign of Elizabeth; and the change which then took place is ascribed to the English divines who had sought refuge in Geneva and other places on the Continent during the reign of Mary. To this day the rubric of the Church of England requires that, if the godfathers and godmothers 'shall certify him that the child may well endure it,' the officiating priest 'shall dip it in the water discreetly and wailly; and it is only 'if they certify that the child is weak,' that 'it shall suffice to pour water upon it;' although sprinkling is now the ordinary practice.

Besides the simple rite of washing with water, and the pronouncing of the formula which declares it to be 'in the name of the Father, and of the Son, and of the Holy Ghost,' baptism was accompanied, from an early period in the history of the church, with various forms and ceremonies. These ceremonies are almost all retained in the Church of Rome, and also generally in the oriental churches, but have been almost entirely laid aside by Protestants. The Church of England retains the sign of the cross made upon the forehead after baptism, but the other Protestant churches in Britain reject it. It was an ancient custom that the *catechumens*, as candidates for baptism were called while receiving instruction with a view to that sacrament, when they were to be baptised, publicly made a profession of their faith and a renunciation of the devil and all his works. The profession of faith is still retained by Protestant churches as the formal ground of the administration of baptism; the renunciation of the devil and his works is required by the Church of England of the person baptised, if an adult, or of the *sponsors* or 'sureties' of a child.—Sponsors (q.v.) were early admitted to answer for those who could not answer for themselves, and particularly for infants. The belief in the absolute necessity of baptism to salvation led even to baptism of the dead among the Montanists in Africa, in which sponsorship was also introduced. Presbyterian and Independent churches generally reject all sponsorship, and regard the profession made by parents as simply a profession of their own faith, which entitles their infants to baptism. The ancient

practice of Exorcism (q.v.) immediately before baptism, has been rejected as superstitious by almost all Protestant churches; as have also that of immersing three times (*trine immersion*), or sprinkling three times, with reference to the three Persons of the Godhead—that of breathing upon the baptised person, 'to signify the expulsion of the devil,' and to symbolise the gift of the Holy Spirit—that of anointing with oil (*Chrism*, q.v.), to symbolise the same gift, or to indicate that the baptised person is ready, like a wrestler in the ancient games, to fight the good fight of faith—that of giving him milk and honey, in token of his spiritual youth, and of his reception of spiritual gifts and graces—that of putting a little salt into his mouth, to signify the wisdom and taste for heavenly things proper to a Christian—that of touching his nostrils and ears with spittle, to signify that his ears are to be ever open to truth, and that he should ever feel the sweet odour of truth and virtue—and that of clothing him after baptism with a white robe (the *chrysom*), in token of the innocence of soul which by baptism he was supposed to have acquired. The white robe and the anointing with oil were retained in the Church of England for a short time after the Reformation.—The giving of a name in baptism (see the article NAMES) is no essential part of it, but is a custom apparently derived from that of the Jews in circumcision (Luke, i. 59–63).—The Church of Rome prefers the use of Holy-water (q.v.) in baptism, but regards any water as fit for the purpose in case of necessity.—According to an ancient usage long obsolete, the ordinary administration of the rite (solemn baptism) was limited to the two great festivals of Easter and Whitsuntide.—Whether baptism may be administered in private has been much debated, both in ancient and modern times. The administration of baptism in private houses, and not in the presence of a congregation, was one of the things earnestly contended against by the Presbyterians in Scotland in the first half of the 17th century; though it is now very usual in some denominations. And apparently upon this latter ground, baptism in private houses is also discouraged by the Church of England, though it is allowed if there is 'great cause and necessity.'

'Baptism for the dead,' alluded to by St Paul (1 Cor. xv. 29), seems to imply that a living man was baptised for a dead and unbaptised Christian, on whom thereby the privileges flowing from baptism were conferred; this baptism is practised by Mormons. (For other questions on baptism, see CIRCUMCISION, GORHAM, GREEK CHURCH, ROMAN CATHOLIC CHURCH, and especially SACRAMENT.) The opinions early became prevalent that forgiveness of sins is obtained and spiritual life begun in baptism, and that it is indispensably necessary to salvation—the only exception made, if any was made at all, being in the case of adult believers, who, desiring baptism, were prevented from receiving the rite, and particularly of those who suffered martyrdom, which was generally held to be equivalent to baptism. The Church of Rome still owns, as supplying the place of baptism by water, these two—baptism by desire, and baptism by blood, i.e. martyrdom.—According to the general doctrine of the Protestant churches, baptism is 'a sign and seal' of the covenant of grace, representing as a sign the blessings of the covenant, and as a seal, confirming the covenant. As a sign, it is generally held to represent in its rite of washing, the removal both of guilt and corruption, by the blood and by the Spirit of Christ, and so to relate equally to pardon and regeneration, although some have limited its symbolic reference to regeneration alone. One of the most important points disputed concerning baptism, is that of baptismal regeneration (see REGENERATION).

Some early Christian sects appear to have rejected baptism, on grounds somewhat similar to those on which it is rejected by Quakers (see FRIENDS) at the present day, who explain the passages relating to it symbolically, and insist that a spiritual baptism is the only real baptism of Christians.

There has been much controversy concerning *Lay Baptism*. We may regard it as certain that in early times the practice of lay baptism was common. Ambrosiaster (a 4th-century writer) says: 'At first all used to teach and all to baptize whenever there was opportunity.' Tertullian (c. 200) tells us that, 'in places where there are no clergy, any single Christian may exercise the functions of the ministry—may celebrate the Eucharist and baptize.' With the growth of the sacerdotal conception of the ministry, and the increasing theological significance that came to be attached to baptism, the celebration of the rite was gradually restricted to duly ordained clergy and ministers, except in the most extreme cases.

Another question much agitated in the church from early times was that concerning the validity of baptism by heretics. The opinion ultimately prevailed that baptism by heretics is valid, except in the case of those who do not baptize in the name of the three Persons of the Godhead. This continues to be the almost universal opinion. The Church of Rome, however, employs a form of 'conditional baptism' in admitting a Protestant convert to its communion.

The *baptism of bells, ships, &c.* is a custom supposed to have been introduced about the 10th century, and still retained in the Church of Rome. The term *benediction* is sometimes substituted for that of baptism, but the rite itself is very similar to that of baptism, and is accompanied with many similar ceremonies—a 'sort of exorcism,' sprinkling with holy-water, anointing 'with the oil of catechumens' and 'with chrism,' a formula of consecration 'in the name of the Father, Son, and Holy Ghost,' and sometimes also, if not always, the giving of a name to the bell consecrated, and even a kind of sponsorship as by godfathers and godmothers in baptism.

See Bingham's *Ecclesiastical Antiquities*; Hall, *Infant Baptism*, Pusey, *Tracts for the Times*, No. 67, and *Scriptural Views of Baptism*; Stanley, *Christian Institutions* (1882); Hofing, *Das Sacrament der Taufe*; books by Godwin (1845), Ingham (1865), Hodges (1875).

Baptiste, a French family of actors. JOSEPH FRANÇOIS ANSELME ('Baptiste père') and his wife ('Baptiste mère') were both well known on the stage when their elder son, NICOLAS ANSELME (born at Bordeaux in 1761), made a reputation in the provinces under the name of Baptiste. Later he won great popularity, especially in comedy, in Paris. His younger brother, PAUL EUSTACHE ANSELME ('Baptiste cadet'; c. 1766–1839), born at Grenoble, also succeeded in comedy.

Baptistery (Gr. *baptistērion*, 'a large vase or basin'), the name given sometimes to a separate building, sometimes to the portion of the church in which the ceremony of baptism is performed. In the latter case, the baptistery is merely the inclosure containing the font, to be seen in most English churches. According to the earlier arrangements of the Christian church, however, the baptistery seems usually to have been a building standing detached from, though in the immediate vicinity of the church to which it appertained. It was the ceremonial building of the church, in which large numbers of converts were initiated at one time by immersion in the large font in the centre of the floor. In later times, these early baptisteries were frequently converted into churches, as in the case of Asti. At Novara, a very interesting

baptistery still exists in connection with the open cloister or atrium, to which alone the neophytes

Section and Plan of Baptistery at Asti.

were admitted before baptism. Baptisteries, at first, were either hexagonal or octagonal, but afterwards became polygonal, and even circular.

The celebrated baptistery of Florence is an octagonal structure, measuring about 100 feet in diameter. It stands detached from, but in the immediate vicinity of the west end of the cathedral. It is built of black and white marble, in the style which Giotto is said to have introduced, and which is still peculiar to Tuscany. The magnificent bronze doors, with their beautiful bas-reliefs, are remarkable features of this famous baptistery. The most celebrated of the three doors was executed by Lorenzo Ghiberti, the earliest being the work of Andrea di Pisa. Fifty years were required for their completion; and it is remarkable that the contracts for their execution are still preserved. Next in importance, and of even greater size, is the baptistery of Pisa. It is circular in form, the diameter measuring 116 feet. The largest baptistery ever erected is supposed to have been that of St Sophia, at Constantinople, which was so spacious as to have served on one occasion for the residence of the Emperor Basilicus.

Detached baptisteries were common in the days of the early church, when adult baptism was practised; but on the introduction of infant baptism, buildings of this size were no longer needed, and the baptistery was absorbed into the church (see ARSE). Numerous examples of circular baptisteries on the model of the Italian ones are still to be found in the south of France.

Baptists, like most other Christians, trace their genealogy back to the New Testament. They derive their principles directly from the teaching of Christ Jesus, and from the faith and practice of the Christian societies of the 1st century. They do not claim to possess evidence of a continuous corporate existence through the ages, but they maintain that the central ideas of Baptist life have not lacked representation at any period. The precursors of the modern Baptists are many; Barclay says, in his *Inner Life of the Religious Societies of the Commonwealth*, 'We have strong reasons for believing that on the continent of Europe small hidden societies who have held many of the opinions of the Anabaptists have existed from the time of the Apostles.' In the sense of the direct transmission of divine truth and the true nature of spiritual religion, it seems probable that these churches have a lineage or succession more ancient than that of the Roman Church.' Montanists and Novatians, Paulicians and Albigenses, Waldenses and Lollards fought for the essential ideas of the Baptist belief and polity.

Modern Baptists came into existence in the 16th and 17th centuries in the attempt to complete the New Testament answer then being given in Christendom to the question: 'What is a Christian Church, and of what persons ought it to consist?' The Reformers appealed to the Scriptures. Protestantism was the inevitable issue of that appeal. Out of Protestantism sprang Puritanism. Puritan-

ism advanced to Separatism; Separatism resulted in Independency; and Independency prepared for the Baptist protest against the inclusion of infants in the Christian Church, on the ground that that church was, according to the New Testament, composed of none but those who intelligently and consciously received Christ Jesus as their Saviour and Lord. That is the historical root of the Baptists. That is the fundamental principle of the Anabaptist and Baptist faith.

John Smith and Thomas Helwys may claim to be the pioneers and founders of the Baptists of England. That was in 1611. They were 'General' Baptists—i.e. they held that the provisions of redemption were not restricted to particular and elect persons, but were open generally to all men. Probably many of them were Lollards, who both in doctrine and in church government had been stirred and guided by the colonies of Anabaptists who came into this country from the Continent. Nor is this to their discredit. The long-maligned Anabaptists are coming to their own under the influence of fresh and impartial investigation. As early as 1527 they demanded equal liberty for all men in matters of religion. Their doctrine of 'justification by faith' was the purest leaven of the Reformation, and their enthusiastic efforts to apply the law of Christ to every relation of human life, and especially to the ordering of the affairs of states, though too early for their day, yet gave both illumination and impulse to the English Baptists. In 1633 John Spilbury formed in London a 'Particular' or Calvinistic Church by secession from an Independent society. The two streams of Baptist life flowed on in their separate channels until 1891, when the 'Generals' and 'Particulars' became one. In 1921 the statistics of the United Baptists showed nearly 2000 churches, 3000 chapels (with almost a million sittings), and over 254,000 registered members.

It was in 1633 Baptist life began in Wales. To-day Wales (with Monmouthshire) has 900 churches, with 550 pastors and 124,000 members.

In the days of Cromwell Baptists were planted in Scotland, but they failed to take root. In 1750 Sir William Sinclair founded the church at Keiss, Caithness. Others followed in Glasgow and Edinburgh, and then came the influence of Robert and James Haldane, one of the most important factors in Scottish Baptist life. The membership to-day is 21,000 in 150 churches.

Thomas Patient introduced the Baptists to Ireland in Cromwell's time; but there was little prosperity before the ministry of Dr Alexander Carson; and now there are only about 2900 Baptists in Ireland, distributed over some 40 churches.

In 1921 statistics for Great Britain, Ireland, the Isle of Man, and the Channel Islands returned some 8000 churches, 4200 buildings (accommodating 1,450,000 persons), 400,000 members, 2000 pastors, 518,000 Sunday scholars, and 56,000 teachers.

Roger Williams, a clergyman of the Church of England, passed through similar experiences to those of John Smith, who was a clergyman of the same church, and so became first a Puritan, and next an Independent. Then he sailed for America. There he came to see that true churches could only be formed of regenerate members; and forthwith founded the first Baptist Church in that land. This was in 1638. Baptists have grown marvelously in the States. In 1909 they ranked second to the Methodists (whose figures were the highest of all), having a membership of 5,425,701. But these figures do not include a million and a quarter of Baptists who are called Disciples or 'Campbellites,' and differ mainly from other Baptists in the emphasis they place on baptism in its relation to the remission of sins; but definite

attempts are being made to effect an amalgamation of the Disciples with Baptists generally. The same unifying process is proceeding with the Free-will Baptists. Nor are the Seventh-day Baptists included in these returns.

Of recent facts, the most significant is the emergence of a large number of Baptist churches in Russia and south-eastern Europe. Without the aid of foreign missionaries, and solely through the circulation of the Scriptures, Baptist communities have sprung up in Hungary and Austria, in Moravia and Bulgaria, and throughout the south-east of Europe; sifted statistics are not yet to hand, but it is believed there are now more Baptists in Russia and south-eastern Europe than there are in England. Add Europe, Asia, Africa, and Australia, and the Baptists of the world cannot number less than 9,000,000 enrolled members, exclusive of those who may be regarded as adherents.

The cardinal principles are these: (1) Christ Jesus is the supreme authority in His Church, and the New Testament is the instrument through which His Spirit expresses His living will. (2) Jorg says that the Anabaptists of the 16th century sought 'an entirely new church, a church of believers.' Hast, another witness, declares that 'their aim was the highest possible, a church of saints. Nowhere in church history is found such a subjugation of all other motives to the religious, such an approach to the order and life of the Apostles.' Personal experience of the grace of God in Christ Jesus constitutes the Christian Church, qualifies for service within it, entitles to spiritual freedom, endows with power of government, and gives value to the ordinances of the Christian religion. Baptism is altogether secondary; conscious acceptance of, and subjugation to, Christ is all in all. Baptists do not deny that the soul may meet God in the sacraments; but the soul must meet with God and know God in Christ before it approaches the sacraments. Without the inward experience baptism is a vain show. They baptise; but it is because they are Baptists; they are not Baptists because they baptise. The distinctive note of the Baptist Church is not baptism, but a vital experience of God. (3) Therefore the baptism of babes is rejected as being contrary to the teaching and genius of the religion of Jesus Christ, and as propagating the notion that there is a magical and saving power in the sacrament of baptism. But the practice of the 'Dedication of Infants' is observed, sometimes in the home and with the family into which the new life has come, and sometimes in the public service, as the church's recognition of the relation of the child to God, and of the duty of the parents and of the church to unite in training the child for His service. (4) In many of the churches in England and in some in the United States and Australia the membership is open to all who confess faith in the Lord Jesus Christ. They teach the obligation and privilege of baptism, but leave the whole question to the individual conscience; holding that the duty to be baptised springs out of the relation of the soul to the Saviour, and not from the relation of the believer to the church. But most of the Baptist churches insist upon baptism as a condition of membership, and some treat it as a qualification for the observance of the Lord's Supper. The last are called Strict Baptists. (5) Baptists have no 'creeds.' They refuse to make subscription to 'dogmatic formulæ,' a condition of membership or ministry. 'Confessions' of faith have been circulated at different times as expositions, and 'apologies' for the purpose of removing misunderstandings and misrepresentations; but the competence of the regenerate soul to form its own 'creed' by the study of the Scriptures is a fundamental principle. (6) Perfect

freedom of access to God for all souls without any intervening priests is a central belief. The Baptist Church is anti-priestly. The ministry is not a profession, but a 'vocation.' It is an office to which some members of the church are called and designated because of their special gifts. (7) Each church is possessed of the power of self-government under its exalted head Jesus Christ, subject to no foreign tribunal or court of review. Members are received or excluded, and discipline is exercised by all the members. The church is autonomous and democratic. (8) Professor Masson quotes from a 'Confession' of 1611: 'The magistrate is not to meddle with religion or matters of conscience, nor compel men to this or that form of religion; because Christ is the King and Lawgiver of the Church and conscience.' He adds, 'This is the first expression of the absolute principle of liberty of conscience in the public articles of any body of Christians.' Roger Williams made that principle not only the basis of the Church he founded, but also of the state of Rhode Island, and so became the apostle of intellectual, 'political, and ecclesiastical liberty before it was taught in any of the schools of philosophy in Europe.' This involves the separation of church and state. (9) But churches are grouped in associations or unions for the training of ministers, for providing funds for aged ministers, for work amongst the young, for the furthering of the interests common to all the churches, and for the evangelisation of the world.

In the United States some of the wealthiest universities are of Baptist origin, notably Chicago, Brown, and Colgate. Besides the universities, there are many theological seminaries. In Britain there are theological colleges at Bristol and Nottingham, at Rawdon, near Leeds, and Regent's Park, London; at Newington, London, there is the Metropolitan or Pastors' College; and the Brighton Grove College at Manchester. Colleges exist at Cardiff and Bangor, Glasgow, and Dublin. Most of these colleges are associated with the local universities. The Baptist Missionary Society was founded in 1792. No mission band has surpassed that society in zeal and enthusiasm, in self-sacrifice and devotion. The names of Carey, Marshman, Ward, and Knibb, and many others, will be held in grateful remembrance by all succeeding generations. Baptists from all over the world met in a congress in London in 1905, and formed a Baptist World Alliance. The European section of it held a congress in Berlin in 1908, and the whole alliance celebrated the tercentenary of modern Baptists in Philadelphia in 1911. Divisions are disappearing. Union increases. The object of the alliance is the defence and propagation of Baptist principles, and the promotion of the common work of the churches.

Evans, *The Early English Baptists*; Adam Taylor, *The History of the English General Baptists* (2 vols. 1818); J. Clifford, *The English Baptists, who they are, and what they have done* (1881); J. C. Carlile, *The Story of the English Baptists* (1905).

Bar, see HERALDRY; and for the so-called 'Bar-sinister,' BATON SINISTER. For bar in other senses, see BARRISTER, ADVOCATE, RIVER, MUSIC.

Bar, Serbian name of Antivari (q.v.).

Baraba', a steppe of Siberia, between the Obi and Irtysh, occupies more than 100,000 sq. m.

Barabra, a Nubian people living on both sides of the Nile from Wady Halfa to Assuan, some 40,000 in number.

Baracoa, now a decayed seaport at the east end of Cuba (pop. 7000), once capital of the island.

Baraguay d'Hilliers, LOUIS (1764-1813), born at Paris, served under Napoleon in Egypt, Italy, and Germany, and commanded a division in the Russian campaign, but, incurring Napoleon's displeasure in the retreat, died at Berlin of fatigue and vexation.—His son **ACHILLE** (1795-1878) fought at Leipzig in 1815, commanded the Baltic expedition in 1854, was made a marshal after the capture of Bomarsund, and distinguished himself at Solferino.

Barante, AIMABLE GUILLAUME PROSPER BRUGIÈRE, BARON DE (1782-1866), born at Riom in Auvergne, held several administrative and diplomatic appointments, and after 1819 sat in the chamber of peers amongst the moderate Liberals. He wrote a history of French literature in the 18th century, and of the Valois Dukes of Burgundy.

Barataria (from Span. *barato*, part of a gamester's winnings given 'for luck' to bystanders), the so-called island assigned in *Don Quixote* to Sancho Panza as his government (see CERVANTES); also the retreat in the delta of the Mississippi, 40 miles S. of New Orleans, of a band of smugglers, slaves, and pirates under the notorious Jean Lafitte (1780-1826). Ostensibly they confined themselves to depredations on the shipping of the English and Spaniards, and they brought much booty to New Orleans, where it was disposed of by their accredited agents. Ultimately the band was broken up in 1814 by an American naval force under Commander D. J. Patterson. The pirate chief and some of his men volunteered to serve the U.S., and at New Orleans in 1815 fought bravely against the British.

Baratynski, JEVGENI ABRAMOVICH (1800-44), born at Tambov, was one of the corps of pages, but was dismissed for a boyish freak. Subsequently he served in the army in Finland, first as private then as officer, and became famous as a poet. One of his chief poems is on Finnish life, another on a gipsy subject. He was a friend of Pushkin.

Barb, a distinct variety of the Arabian horse, developed amongst the Moors of Barbary, and by them introduced into Spain; less noted for symmetry and beauty than speed and endurance. The 'Godolphin Arabian' (see HORSE) was properly a barb.

Barbados, or BARBADOES, in the Windward Islands, the most easterly of all the West Indies, is a British possession. It derives its name ('bearded') from the Portuguese word for the bearded fig (*Ficus barbata*), found abundantly on the island. The spelling Barbadoes, less correct than Barbados, became common from the time of such early English works as Ligon's *History of Barbadoes* (1657) and Phillips's *Journal of a Voyage to the Barbadoes* (1693-4), but has long been superseded by the official Barbados. The island lies 78 miles E. of St Vincent, in 13° 10' N., and 59° 33' W. Its length is 21 miles; its greatest breadth, 14½ miles; and its area, 166 sq. m., or 106,470 acres, three-fourths being under cultivation (mostly sugar). At Bridgetown, the capital, is the open roadstead of Carlisle Bay, the only harbour, the island being almost encircled by coral-reefs, which here and there extend as much as 3 miles to seaward. Inside these reefs the coast, excepting at two points, presents long lines of sandy beach. The interior is generally hilly, Mount Hillaby, the loftiest summit, rising 1104 feet above sea-level. Setting aside occasional attacks of yellow-fever, leprosy, and elephantiasis ('Barbados leg'), the climate is healthy. The temperature is equable; and the average rainfall is 61.5 inches. Shocks of earthquake are sometimes felt, and thunderstorms are frequent and severe. But hurricanes are the grand scourge of Barbados.

In 1780 one of them destroyed 4326 persons, and property to the value of £1,320,564 sterling; and in 1831 another destroyed 1591 persons, and property to the value of £1,602,800 sterling. In 1780 the winds and the waves together carried a 12-pounder gun 140 yards. Another appalling and destructive hurricane ravaged Barbados and St Vincent in September 1898. In 1834, the first year of the apprenticeship under the imperial act of emancipation, the population was 102,000; by 1891 it had increased to 180,000; by 1911 it had fallen to 172,000 (about 20,000 white), and by 1921 to 159,000. Between 1833 and 1920 the revenue increased from £20,900 to more than £420,000 (the expenditure being somewhat less). There is some fishing. The exports are chiefly sugar, molasses, and cotton. Asphalt deposits are worked, and petroleum has been discovered. Everywhere cultivated in regular plantations, Barbados affords no room for the squatting of negroes on unreclaimed lands, as in Jamaica and other West India possessions. On this account, if from no other cause, the negroes have been compelled to labour diligently for hire, and are generally in a condition most creditable to their industry and prudence. Altogether the Barbadians are a shrewd and clever people. Barbados (which has never changed hands since it became English in 1605) was first colonised in 1625, having previously been depopulated by the Spaniards. It has a Governor, Executive Council, Legislative Council (appointed by the Crown), and elected House of Assembly. It was made the see of a bishop in 1824; and the bulk of the population belong to the Anglican communion. Codrington College (founded 1745) is affiliated to Durham University. A railway (28 miles) runs from Bridgeton across the island and up the east coast.

See WEST INDIES; and Schomburgk's *History of Barbados* (1848); Stark's *Guide* (1893); Sinckler's *Barbados Handbook* (1912).

Barbados Cherry, the name given in the West Indies to the fruit of two small trees, *Malpighia urens* and *M. glabra*, which are cultivated for its sake. The fruit of *M. urens* is small; that of *M. glabra* is like a Mayduke cherry in size and appearance, but inferior in flavour. Each fruit contains three stones. The leaves of *M. urens* have stinging hairs on the under side. See MALPIGHIACEÆ.

Barbados Gooseberry (*Peireskia aculeata*), a pleasant West Indian fruit, produced by a species of Cactus, with a round stem, thick flat alternate leaves, and large strong spines. The flowers are white and ornamental, and the fruit yellow; they are eaten fresh or preserved.

Barbados Leg, the same as *Elephantiasis Arabum*; see ELEPHANTIASIS.

Barbara, St, suffered martyrdom at Nicomedia, in Bithynia, in 240 or 306. Her father, Dioscorus, a fanatical heathen, delivered her up to the governor, Martianus, who, struck with her intelligence and beauty, attempted first by arguments to make her relinquish Christianity, and when that failed, had recourse to the most exquisite tortures. At last, her father offered himself to behead her; scarce had he done so when he was struck with lightning. Hence St Barbara is to this day prayed to in storms, and is the patron saint of artillery, being represented in art with cannons, a tower, and a monstrosity. Her festival is 4th December.

Barbara, Celarent, &c., mnemonic words used in logic to denote certain Syllogisms.

Barbare'a. See CRESS.

Barbarian (Gr. *barbaros*), among the Greeks, as early as the time of Homer, signified one who

could not speak the Greek language; and this restricted signification was not wholly obsolete even in the age of Plato, for the latter divides the entire human race into *Hellenes* and *Barbaroi*. Like the Latin *barbus*, the word is probably onomatopoeic, meant to represent a meaningless babble of sound, such as the Greeks conceived all foreign languages to be. It first began to acquire its secondary and invidious signification at the period of the Persian wars. The Greeks, who always exhibited a proud consciousness of their superior intellect and privileges, employed the term to designate the character of their enemies, as opposed to Greek civilisation, freedom, or intelligence. Subsequently, when Rome, under Augustus, became the mistress of the world, the word was applied to all the Germanic and Scythian tribes with whom she came into contact. In modern times, barbarian signifies savage, uncivilised, or ignorant.

Barbaros'sa. See FREDERICK I.

Barbarossa, HORUK and KHAIR-ED-DIN, two brothers, renegade Greeks, natives of Mitylene, who, as Turkish corsairs, were the terror of the Mediterranean during the first half of the 16th century. The former being invited to Algiers to aid against the Spaniards, treacherously murdered the Emir to whose assistance he had come, seized the town, and began to extend his conquests; but the Arabs summoned the Spaniards to their aid, and in 1518 he was captured and beheaded. The younger brother succeeded him in Algiers, and, having put himself under the protection of the Porte, fortified the town, and even conquered Tunis for the Turks. After Charles V. retook Tunis, Khair-ed-din preyed on the almost defenceless coasts of the Mediterranean, defeated the Christian powers in several sea-fights, and aided the French in taking Nice in 1543. Finally, with thousands of captives, he returned in triumph to Constantinople, where he died, July 4, 1546.

Barbaroux, CHARLES JEAN MARIE, one of the greatest of the Girondists, was born at Marseilles, 6th March 1767. At first an advocate and journalist at Marseilles, he was sent by that city to the Constituent Assembly at Paris. There he opposed the court party, and took part with the minister, Roland, then out of favour. After the events of the 10th of August 1792, he returned to his native town, where he was received with enthusiasm, and was soon after chosen delegate to the Convention. In the Convention he adhered to the Girondists, and belonged to the party who, at the trial of the king, voted for an appeal to the people. He boldly opposed the party of Marat and Robespierre, and even directly accused the latter of aiming at the dictatorship; consequently he was, in May 1793, proscribed as a royalist and an enemy of the republic. He fled to Calvados, and thence with a few friends to the Gironde, where he wandered about the country, hiding himself as he best could for about thirteen months. At last, on the point of being taken, he tried to shoot himself; but the shot miscarried, and he was guillotined at Bordeaux, June 25, 1794. This 'brave and beautiful young Spartan' was one of the great spirits of the revolution. There was no loftier-minded dreamer in the Girondist ranks; hardly a nobler head than his fell in that reign of terror. He was 'ripe in energy, not ripe in wisdom,' says Carlyle, or the history of France might have been different.

Barbary, an extensive region in Northern Africa, comprising the countries known in modern times under the names of Barca, Tripoli Proper, Fezzan, Tunis, Algeria, and Morocco; and in ancient times, under those of Mauritania, Numidia,

Africa Propria, and Cyrenaica. It stretches from Egypt to the Atlantic Ocean, and from the Mediterranean to the Desert of Sahara, or between 10° W. and 25° E. long., and 25° to 37° N. lat. The north-west of this region is divided by the Atlas Mountains into two parts. Though pertaining geographically to Africa, Barbary is not specially African in any of its characteristics; but in climate, flora, fauna, and geological configuration, belongs to that great region which forms the basin of the Mediterranean. Among the races, besides French and other Europeans, may be mentioned Berbers (Kabyles in Algeria), Moors, Arabs, Turks, Kulgis (mixed Moors and Turks), Jews, and Negroes. The history of Barbary is a record of successive conquests by Romans, Vandals, Arabs, Turks, Spaniards (parts of Morocco), French (Algeria, 1830-37; Tunis, 1881; Morocco, 1904-14), and Italians (Tripoli, 1911). Under the Turks, Barbary was notorious for its pirates or Corsairs (q.v.), especially from the 16th, through the 17th, and into the 18th century. The Berbers, the earliest inhabitants known to history, have been overrun by the others; and the Mediterranean-European connections of this part of Africa have been recently emphasised by the view now largely held that they belong to the same ethnographical stock as the Basques in Spain and France, and other Iberians farther north; some connect them with the ancient Egyptian race. Recent Celtic philologists trace Basque, Berber, and even Egyptian influences on some of the neo-Celtic tongues. It is doubtful whether the old name *Barabara*, an ancient Egyptian word, was brought hither by the Arabs; later it was confused with the *Barbari*. See BARBARIAN; also BERBERS, AFRICA, ALGERIA, MOROCCO, TRIPOLI, TUNIS.

Barbary Ape (*Macacus inuus*), also called Pigmy Ape, Magot, and Macaque, a small tailless monkey, the only form now found in Europe, where it is restricted to a very few on the Rock of Gibraltar. Whether it is indigenous or not is uncertain. It is extremely abundant in some parts of North Africa, inhabiting rocky mountains and woods, passing from tree to tree with great agility, and

Barbary Ape.

often descending in herds to plunder gardens and plantations. It feeds on fruits, roots, &c.; and its fondness for eggs may have given rise to the ancient story of the battle of the pigmies and the cranes. It is yellowish-brown, pale underneath; and in size resembles a middle-sized dog. The characters generally agree with those of other macaques, differing most conspicuously in the stump-like rudiment of a tail, provided, however, with the usual muscles. The absence of tail and the length of the muzzle make the magot somewhat baboon-like. It usually walks on four feet, although it can be trained to stand or walk, in a more awkward manner, on two. It is filthy in its habits. Its anatomy was first studied by Galen in the 2d century, and the animal is thus of some historic

interest, as it supplied him with an opportunity of understanding by analogy the anatomy of man when obscurantist regulations made the dissection of the human body all but impossible.

Barbastelle, a bat with hairy lips, a native of England. See BAT.

Barbastro, a town of Spain, in the province of Huesca, 44 miles NW. of Lerida by rail. It is situated on the Vero, and has a cathedral dating from the end of the 15th century. Population, 7000.

Barbauld, ANNA LETITIA, an English authoress, was born in 1743, at Kibworth-Harcourt, Leicestershire, where her father, the Rev. John Aikin, D.D., a dissenter, kept an academy. Her private education, the religious influence of her home, and her secluded life in the country, were well fitted to develop early her natural taste for poetry; but it was not until 1773 that she published her *Poems*, which ran through four editions in the twelvemonth. Encouraged by this, she the same year, conjointly with her brother, John Aikin (q.v.), published *Miscellaneous Pieces in Prose*. Next year she married the Rev. Rochemont Barbauld, a dissenting minister at Palgrave, Suffolk, in which village the newly married pair opened a boys' boarding-school, which was soon made celebrated by Mrs Barbauld's literary fame and assiduity. During the ten years spent here she published *Early Lessons for Children*, her best work; *Hymns in Prose*, and *Devotional Pieces*. In 1792 she commenced with the same brother the well-known series, *Evenings at Home*. In 1810 she published a collection of the British novelists, the task of editing which she had undertaken to divert her mind from the suicide of her husband two years before. Her last poetical effort was an ode, *Eighteen Hundred and Eleven*, in which she anticipated Macaulay's New Zealander. All her compositions are characterised by an old-world grace, an easy, flowing style, pure and elevated sentiment, and give token of a mind well versed in classical literature. She died at Stoke-Newington, 9th March 1825. See the Memoir by Lucy Aikin, prefixed to the collection of the *Works of A. L. Barbauld* (2 vols. 1825); the Lives by Mrs Le Breton (1874) and Grace Ellis (Boston, U.S. 1874); and Lady Richmond Ritchie's *Book of Sibyls* (1883).

Barbecue, the name given in America to a hog, ox, or any large animal broiled or roasted whole, and now applied in the United States to a large social entertainment, generally in the open air, where animals are roasted whole, and food and drink of all kinds provided on a generous scale.—The word is probably derived through the medium of Spanish from a Haitian *barbacôa*, 'a framework of sticks raised upon posts,' used for supporting above the fire meat that is to be smoked or dried.

Barbed, as a heraldic term, is applied to an arrow whose head is pointed and jagged; also to the five green leaves, or more properly sepals, which are shown between the five petals of the conventional Rose of Heraldry (q.v.).

Barbel (*Barbus*), a genus of fishes in the family of the Cyprinidae (q.v.), differing from *Cyprinus* (Carp, Gold-fish, &c.) in the short dorsal and anal fins, in having one of the rays of the dorsal fin strong and serrated, and the mouth furnished with four soft tactile barbules (whence the name barbel, from Lat. *barba*, 'a beard'), two near the point of the snout, and one at each angle of the leathery mouth. The upper jaw also extends considerably beyond the lower. The species are very numerous. Like the other Cyprinidae, they are all inhabitants of fresh water, and generally of muddy ponds and rivers, where they seek food, especially at night, by

ploughing up the mud with their snouts like swine, and are said often to seize the small fishes which come to share the worms and insects which they turn up. They also feed upon the leaves and roots of aquatic plants.—The Common Barbel (*B. vulgaris*) is abundant in many of the rivers of the

Barbel.

temperate parts of Europe, such as the Weser, Elbe, and Rhine. It is the only species found in Britain, and there only in some of the still and deep English rivers. It is very abundant in the Thames, frequenting the weedy parts of the river in shoals in summer, and seeking the deeper water in winter, becoming so torpid during cold weather, that the fishermen sometimes take it with the hand, or by pushing it with a pole into a small net fastened to an iron hoop. It grows to a large size, sometimes 3 feet in length, and 15 to 18 pounds in weight; it has a long shape, in section nearly circular; the general colour of the head and upper part of the body, greenish brown, becoming yellowish green on the sides, the belly white, the fins red, and the tail of a deep purple colour. It affords sport to anglers, and is much fished about London, but is a very coarse fish, and little used for food except by the poor, who often boil bacon with it to give it a relish. The flesh is said to be improved by being kept for some days in fresh water. The larger barbels are esteemed the best. The eggs, which are very numerous, are deposited in strings about stones, and the roe has poisonous qualities, although its effects are disagreeable rather than permanently injurious.—The Binny, or barbel of the Nile, is very abundant in that river; it attains a very great size, 70 lb. or upwards.

Barbellion, W. N. P. See CUMMINGS (BRUCE).

Barber, a shaver of the beard (Lat. *barba*), and usually also a hair-cutter. Barbers are of great antiquity; the office of the barber is referred to by the prophet Ezekiel (v. 1). In all oriental countries, including China, the shaving the whole or part of the head continues to be performed by barbers. In every part of the world, the professional barber and hairdresser is celebrated for his garrulity and general obliging qualities, such being required by those who place themselves in his hands. The amusing character of the barber in one of the tales in the *Arabian Nights*, and also of the barber in Rossini's *Barber of Seville*, will readily occur to recollection. Barbers at one time acted as a kind of surgeons, and accordingly occupied a higher social position than they now enjoy. Lately, on account of the simple mode of trimming the hair, and of the prevalence of private shaving, the business of the barber in England has greatly declined, and his services are much more confined to the humbler classes. In the United States, the business of the barber is largely in the hands of the coloured population. Anciently, one of the utensils of the barber was a brass basin, with a semicircular gap in one side to compass a man's throat, by which means, in applying the lather to the face, the clothes were not soiled. Readers will recollect that Don Quixote assumed a barber's basin as a helmet—Mambrino's. At the end of a pole, the brass basin is

still hung out as a sign at the door of the barber in Scotland, Germany, and other countries.

In former times, as already stated, barbers acted as a kind of surgeons, or at least phlebotomists, and such appears to have been the case in all countries. Till this day, on the barber's pole, there is represented a twisted or spiral ribbon, which symbolises the winding of a ribbon round the arm previous to blood-letting. In London, Edinburgh, and elsewhere, the barbers formed corporations with certain privileges. The surgical duties of these bodies now pertain to the corporations of surgeons. The Company of Barber-surgeons was first incorporated by Edward IV. in 1461; in 1540 its title was changed to 'Company of Barbers and Surgeons,' and the practitioners of 'barbary' were restricted to drawing of teeth. In 1745 an act was passed, from whose preamble we learn that the discovery had been made that the business or trade of a barber was 'foreign to, and independent of, the practice of surgery;' and it therefore dissolved the connection between the two bodies, and remitted the barbers to the more humble functions they now perform. But this is done with an express saving of all their privileges as a company or corporation, and as such they exist to the present day. The barbers still retain their ancient hall—which they possessed before the surgeons were disunited from them—in Monkwell Street, Cripplegate, in the city of London. See BEARD, GUILDS, SURGEONS; and *Annals of the Barber-Surgeons of London* (1890).

Barberini, an Italian family, originally of Tuscan origin, that acquired wealth by trade in the 16th century, and rose to the front rank among the Roman nobility and in the cardinalate. The family rose to power and influence on the elevation of Maffeo Barberini as Urban VIII. to the papal chair in 1623. His brother Carlo became general of the papal troops; while to a son of the latter, Taddeo, were given the principality of Palestrina and other fiefs. Francesco (1597-1679), brother of Taddeo, cardinal and vice-chancellor, was founder of the Barberini Library; another brother, Antonio (1608-71), was cardinal and high-chamberlain under Urban VIII. Their increasing power and grasping ambition excited the jealousy of the neighbouring princes, and led to the war (1641-44) in which Odoardo, Duke of Parma, defeated the papal troops. Under Urban's successor, Innocent X., proceedings were instituted against the Barberini, who fled to France; but returned again to Italy in 1652. The principality of Palestrina has belonged since 1630 to the family, while their palace at Rome—long the resting-place of the Portland Vase (q.v.)—gives evidence of their wealth and splendour. Barberino di Val-d'Elsa, a village near Florence, the birthplace of Urban VIII., gives name to the family, one of their palaces being here.

Barberry (*Berberis*), a genus of plants, of the natural order Berberidæ (q.v.). All the species, which number about 100, and range through the temperate regions of the world, with the exception of Australia and South Africa, are shrubs with yellow flowers, having their parts usually in multiples of three. The stamens are sensitive, moving inwards when irritated, so as to dust the insect visitor with pollen, and so facilitate cross fertilisation. The fruit is a berry with two or three seeds. The genus is divided into two sections—those with simple leaves, whether deciduous or evergreen, forming the sub-genus *Berberis* proper, and those with pinnate evergreen leaves, the sub-genus *Mahonia*.—The Common Barberry (*B. vulgaris*) is a native of the Palearctic region, but has been

introduced into the United States; it is a very ornamental shrub, especially when covered with its brightly coloured berries. The fruit of the ordinary varieties is too acid to be eaten, but makes excellent preserves and jelly, and is also a convenient source of malic acid. Although an

a, Flowering branch, and b, fruit, of Common Barberry (*Berberis vulgaris*);
c, Branch in fruit of *B. Darwintii*.

excellent hedge-plant, its extirpation in such localities is advisable, since (as was indeed suspected by agriculturists long before it was demonstrated by De Bary) it furnishes the intermediate host for the 'æcidium-stage' of the fungus which occasions the rust of wheat (see RUST). The yellow root and bark has been used in dyeing, and numerous species are so employed in Chile and Peru, and in the Himalayas; the astringent bark has also been used in tanning. *B. Lycium* is peculiarly astringent, and its extract is employed in North India in ophthalmia. *B. dulcis*, the Sweet Barberry, is a native of Chile; its fruits resemble in size and colour those of the black currant. Wholesome and pleasant fruits are produced also by *B. aristata* and *B. asiatica*, the berries of both of which are dried in Nepal, after the manner of raisins, and by several other species; but more frequently they are insipid or harsh, especially in *Mahonia*. New species and varieties are frequently introduced, and are ornamental, easily cultivated additions to the shrubbery.

Barberton, a mining-town of the Transvaal, at the De Kaap gold-fields. It is situated at the base of a high range of hills 2500 feet above sea-level, 180 miles E. of Pretoria, and 100 NW. of Delagoa Bay, with both of which it is connected by railway (a branch-line constructed in 1894-95). In 1886-87, owing to the discovery of rich gold reefs, there was a 'rush' to the place, and the population soon rose to 8000 or more; but the superior attractions of the Witwatersrandt reefs and the growth of Johannesburg soon reduced Barberton to a place of 2500 inhabitants.

Barbet, a name applied to birds of the family Capitonidæ, allied to woodpeckers and toucans. The bill is large and stout, and generally bears strong bristles, to which the name refers. The plumage is usually brilliant. The barbets are strictly arboreal birds, somewhat sluggish in habit, feeding chiefly on insects, buds, and fruits, and nesting like woodpeckers. They are widely represented in forest-

country in tropical Asia, Africa, and America. Their ringing metallic note is suggested by many of their popular names—'Copper-smith' (*Xantholoma*), 'Iron-smith' (*Cyanops*), 'Tinker-bird' (*Barbatula*).

Barbey d'Aureville, JULES (1808-89), novelist and critic, was born at Saint-Sauveur-le-Vicomte, Manche, settled in Paris, and contributed literary articles to the *Pays* and other papers. Among his most notable novels—often *rusqués*, ultra-Catholic, and Byronic-romantic at once—were *Une Vieille Maitresse*, *L'Ensorcelée*, *Chevalier Destouches*, *Les Diaboliques* (shorter stories). Other works were *Les Romanciers* and *Goethe et Diderot*. See books on him by Gréllé, Clerget, and Seillière, and Gosse's *French Profiles* (1895).

Barbican (Old Fr. *barbacane*, also in Spanish, Portuguese, and Italian forms; perhaps of Arabic or Persian origin—Colonel Yule suggests *bākhānah*, 'gate-house,' the usual name in the East for a towered gateway), a projecting watch-tower over the gate of a castle or fortified town. The term barbican was more specially applied to the outwork, intended to defend the drawbridge, which

Barbican at Carcassonne.

in modern fortifications is called the *tête du pont*. There are a few perfect barbicans remaining in England, as at Alnwick and Warwick; but the best example of one, as well as of the other parts of the fortification of the middle ages, is probably to be seen at Carcassonne. The street called Barbican in London, near Aldersgate Street, marks the site of such a work, in front of one of the gates of the old city.

Barbier, (1) ANTOINE ALEXANDRE, a French bibliographer, born at Coulommiers, January 11, 1765. Bred to the church, he subsequently left his curacy, married, and in 1794 removed to Paris, where he was appointed to collect and place in the public libraries the books of the suppressed monasteries. In 1798 he became librarian to the Directory, and as private librarian to Napoleon (1807), founded the libraries of Fontainebleau, Compiègne, St Cloud, and the Louvre. He held the same appointment under the Bourbons until 1822, and died in Paris, December 5, 1825. His most important work is his *Dictionnaire des Ouvrages Anonymes et Pseudonymes* (Paris, 1806-9; 3d ed. 4 vols. 1872-79).—(2) HENRI AUGUSTE, a French satirist, born at Paris, April 28, 1805. Abandoning the bar for a literary career, he made a first venture with an historical novel, but the Revolution of July 1830 led him to make his first essay in the field of satirical poetry. His satires of this period are collected in a volume entitled *Iambes* (1831), which has been so popular that a 31st edition appeared in 1882. His subjects include office-seeking and the greed and ambition

of public men, the corruption of public morals, and the mania for committing suicide. But his later works show an astonishing falling off, and are all distinctly inferior to his earlier efforts. The list includes *Il Pianto* and *Lazare*, republished together (1837) under the title *Satires et Poemes*; *Pot-de-Vin* (1840), *Rimes Héroïques* (1843), a metrical translation of Shakespeare's *Julius Cæsar* (1848), *Silves, Poésies Diverses* (1864), *Satires* (1865), a volume of romances, *Trois Passions* (1867), and his posthumous *Souvenirs* (1883) and *Poésies* (1884); but in none can the brilliant author of *Iambes* be recognised. He was elected to the French Academy in 1869, and died February 14, 1882.—(3) PAUL JULES (1825–1901), born at Paris, wrote *dramas*, comedies, and vaudevilles, and many libretti.

Barbitone. See VERONAL.

Barbizon, a village on the skirts of the forest of Fontainebleau, a great artists' resort, the home of Millet; Corot, Diaz, Daubigny, and Rousseau were also of the 'Barbizon school' of painters. See D. C. Thomson, *The Barbizon School* (1891).

Barbou, the name of a celebrated French family of printers, the descendants of Jean Barbou of Lyons, who lived in the 16th century. From his press issued the beautiful edition of the works of Clément Marot in 1539. His son, Hugues Barbou, removed from Lyons to Limoges, where, among other works, his celebrated edition of *Cicero's Letters to Atticus* appeared in 1580. Joseph Gérard Barbou, a descendant of the same family, settled in Paris, and continued in 1755 the series of Latin classics in duodecimo—rivals to the Elzevirs of an earlier date—which had been begun in 1743 by Conzelier. This series of classics is much prized for its elegance and correctness.

Barbour, JOHN, the father of Scottish poetry and history, regarding whose life but little is on record beyond the production of the national epic, *The Brus*. Nothing is known of his parentage, and of his birth it can only be conjectured to have been about 1316. The ascertained facts of his life are few. We are informed only that in his own age he was accounted a man of great learning and worth; that he was Archdeacon of Aberdeen as early at least as 1357, and held that office till his death in 1395; that in 1357 he travelled into England, accompanied by three scholars, for the purpose of studying at Oxford; that he repeated his visit to England for the same purpose in 1364; that in 1365 he obtained a passport 'to travel through England with six companions on horseback towards St Denis and other sacred places'; that in 1368 he again received permission to travel through England with two servants and two horses, on his way to France; that in 1373 he was clerk of audit to the household of King Robert II., and one of the auditors of exchequer; that in 1375 his great poem was more than half finished; that in 1377 he had a gratuity of ten pounds from the king; that in 1378 he received a perpetual annuity of twenty shillings, which in 1380 he bequeathed to the dean and chapter of Aberdeen, under the condition that they should sing a yearly mass for the repose of his soul; that in 1381 he had a gift from the crown of the ward of a minor, whose estate lay within the parish of which he was rector; that in 1382, and again in 1384, he was one of the auditors of exchequer; that in 1388 a further pension was granted him of ten pounds a year; and that he died on 13th March 1395, his anniversary in the cathedral of Aberdeen being celebrated on that day until the Reformation. Besides *The Brus*, Barbour wrote, according to Wyntoun, a poem on the Brutus legend and *The Stewarts' Original*, both lost. It is disputed whether he is the author of

the Troy-book fragments, or of *The Legends of the Saints*, both discovered by Mr Bradshaw in Cambridge University Library. Some have ascribed to him *The Buik of Alexander* (from the French). Modelled on Statius, *The Brus* is distinguished by great purity and clearness of style. Barbour's imagery is not rich, but he is seldom other than lively, simple, and energetic. He has depicted, in rough but faithful outline, the life, manners, and deeds of a truly heroic age, and given to his country almost the first poem in her literature, and the earliest history of her greatest king.

The Brus, printed at Edinburgh in 1571, was edited by Dr Jameson in 1820; by Cosmo Innes, for the Spalding Club, in 1856; by Skeat, for the Early English Text Society, in 1870–77, and for the Scottish Text Society, in 1893–94; and by G. W. Mackenzie in 1909. Of the *Legends of the Saints*, still claimed for him by Dr G. Nelson in *John Barbour, Translator and Poet* (1900), there is an edition by Horstmann (Heilbronn, 1881–82), and one by Metcalfe (Scot. Text. Soc., 1887–89).

Barbu'da, a West Indian island, 30 miles N. of Antigua, of which it is a dependency. It is 10 miles long by 8 broad, with an area of 60 sq. m. A reef-surrounded coral island, it is fertile, but the greater part of the interior is a dense forest.

Barbusse, HENRI, French man of letters, born at Asnières (Seine) in 1874, fought valiantly in the Great War. He wrote *Pleureuses* (poems; 1895), *Les Suppliants* (1903), *L'Enfer* (1908), *Nous Autres* (1914), *Le Feu* (an indictment of war, in form of a novel; 1916), *Clarté* (1918), &c.

Barby, a town of Prussian Saxony, on the left bank of the Elbe, 15 miles S.E. of Magdeburg. It is well built, and has an old castle. Pop. 10,000, engaged in sugar-refining, shipbuilding, agriculture, and river navigation.

Barca, a country of North Africa, between the Gulf of Sidra and Egypt, nearly corresponds with the ancient Cyrenaica (q.v.). Much of it is a high plateau. The climate is healthy and agreeable in the more elevated parts, which reach a height of almost 2000 feet, and in those exposed to the sea-breeze. There are none but small streams, but the narrow terrace-like tracts of country are extremely fertile, realising all that is said of the ancient Cyrenaica. Rice, dates, olives, saffron, &c. are produced in plenty. The pastures are excellent; the horses still celebrated, as in ancient times. But the good soil extends over only about a fourth of Barca: the east exhibits only naked rocks and loose sand. Many ruins in the north-western parts attest its high state of cultivation in ancient times, when its five prosperous cities bore the title of the Libyan Pentapolis. So early as the time of Cyrus, Barca became a state, which proved dangerous to the neighbouring state of Cyrene; ere long it became subject to Egypt. The Arabs took it from the Eastern Empire in A.D. 641. With Tripoli (q.v.) it fell under the Turks in the 16th century, being sometimes treated as a separate province; and with Tripoli it was occupied by the Italians in October 1911. It now forms the Cyrenaica district of Libia Italiana. Pop. 400,000, Berbers, Arabs, Turks, Italians, and Greeks. The province is sometimes named after the capital, Bengazi (q.v.). The old city of Barca, inland from Bengazi, is now represented by the village of Merj.

Barcarolle (Ital. *barcaruola*, 'a boat-song'), a species of song supposed to have originated amongst the gondoliers of Venice, having a simple, regular melody, in a rhythm corresponding to the stroke of the oar. The name is applied to musical compositions for voice or pianoforte of a similar character; and its form has been freely used by Auber, Mendelssohn, and Chopin.

Barcello'na, a town of Sicily, in the province of Messina, and 20 miles from the city of Messina. The town consists of two communes, Baicellona and Pozzo di Gotto, standing close together, and separated only by a small stream; pop. 25,000. Baicellona is situated in a broad plain, between the mountains and the sea, abounding in corn, wine, oil, and fruit, and has silk manufactures and sulphur-baths.

Barcelona, the second largest and the most important manufacturing city in Spain, in the province of the same name, is beautifully situated on the Mediterranean between the mouths of the Llobregat and the Besos, in the midst of a district as luxuriant as a garden. By rail it is 228 miles E. of Saragossa and 439 ENE. of Madrid. The ramparts and citadel have given place to the expansion of the city, and the ground formerly covered by the citadel has been laid out in gardens. The castle of Montjuich, on a hill 735 feet high, commands the town from the south, and the arsenals near by comprise infantry and cavalry barracks. Barcelona is divided into two parts—the old town and the new—by the *Rambla* (river-bed), which has been formed into a beautiful promenade. There is another fine promenade, the *Muralla del Mar*, or sea-wall. The streets of the old town, forming the north-west division, are crooked, narrow, and ill paved. The buildings are chiefly of brick, four or five stories high, with flat roofs. Those of the new are much more modern in appearance, spacious, and regular. There is a large suburb to the SE. of the town, called *Barceloneta*, where the seafaring portion of the population chiefly reside. The suburbs of *Gracia*, to the NW., and *Sarria* are favourite holiday and summer evening resorts of the inhabitants. Barcelona is the see of a bishop. It has a university (1430; rebuilt 1873), and colleges and schools; public libraries, in one of which there is a splendid collection of MSS.; several hospitals and other charitable institutions; theatres, one of them capable of holding 4000 spectators; numerous ancient and elegant churches and convents, and a cathedral which, begun in 1298, is not yet completed. Barcelona's textile and engineering industries are very important. Of the former, cotton is the greatest. Coal is expensive, and its use is likely to diminish before the rivalry of electricity, obtained during the 20th century from the waterfalls of the Pyrenees. Its fabrics are inferior to English goods, and it is said that they are exported to England and reimported with British marks and labels. The staple imports are raw cotton, coffee, sugar, and other colonial produce; also wheat, spirits, timber, salt-fish, hides, wax, iron, and coal. Its export trade includes textiles, fruits, vegetables, wines, oil, and salt. Next to Bilbao, it is the most important port in Spain. The extended port in 1913 had quays $2\frac{1}{2}$ miles in length, with an area of 186,500 square yards. From of old it was a famous port—the *Consolato del Mare* was promulgated here in 1494 (see *MERCANTILE LAW*); but great engineering skill and constant dredging were required to convert the open roadstead into a safe harbour. The city, which is the most autonomous municipality in Spain, freely electing its council, and the council the *alcalde*, has often been the headquarters of Carlist, republican, and anarchist movements. Barcelona has excellent railway communication. Steamers run to various Mediterranean ports, including the Balearic Islands. In 1864 the population was 190,000; in 1868 it had been reduced (mainly by cholera) to 167,095; (1878) 249,106; (1887) 268,223; (1910) 560,000; (1920) 710,325. It is the headquarters of Catalan literature and Catalan art (Fortuny, &c.), and has more scientific institutes than any other Spanish town

but Madrid.—The province of Barcelona has an area of 3000 sq. m., and a population of 1,300,000.

Barcelona is a place of great antiquity, and associated with many historical events. Local tradition fixes the date of its foundation 400 years before the Romans; and it is said to have been refounded by Hamilcar Barca, the father of Hannibal, from whom its ancient name, *Barcino*, was derived. An important city under the Romans, Goths, and Moors, Barcelona in 878 became an independent sovereignty, under a Christian chief of its own, whose descendants continued to govern it, and to hold the title of Counts of Barcelona until the 12th century, when its ruler adopted the title of King of Aragon, to which kingdom it was annexed. During the middle ages, Barcelona became a flourishing seaport, rivalled in the Mediterranean by Genoa only. To its commercial code, framed in the 13th century, much deference was paid by the whole of Europe; and it was at this time 'a city of commerce, conquest, and courtiers; of taste, learning, and luxury; and the Athens of the troubadour.' It was one of the first cities of Spain into which printing was introduced. Columbus was received here in 1493 by Ferdinand and Isabella, after his discovery of America. Here also a ship was launched in 1543, which was moved by means of steam. In 1640 it appealed to France against the tyranny of Philip IV.; but it turned against that country in the war of the Spanish Succession, and adhered to Austria. In 1705 the fortress of Montjuich was surprised and captured by Lord Peterborough, and the city surrendered shortly afterwards. In 1714, after a most heroic defence, it was stormed by the Duke of Berwick, on behalf of Louis XIV., and given over to fire and sword. Napoleon perfidiously obtained possession of it in 1808; and with one or two reverses, and in the face of great difficulties, it was held by the French until the treaty of peace concluded in Paris in 1814. For 13 years, Barcelona remained quiet under the iron rule of España; but in 1827 its old turbulent spirit returned, and it rose in favour of Don Carlos. Since that time Barcelona has generally supported the government. But a Progressist rebellion in 1856 caused much bloodshed, and in 1874 the Federalists raised an insurrection here. During the 20th century strikes have been numerous and notable.

Barcelona, formerly New Barcelona, a town of Venezuela, stands near the mouth of the Neveri, 160 miles E. of Carácas. The surrounding country is fertile, but Barcelona is very unhealthy. Cattle, jerked-beef, hides, indigo, cotton, and cacao are the chief exports. Pop. 11,000.

Barcelona Nuts. See HAZEL.

Barcidæ. See HAMILCAR, HANNIBAL.

Barclay, ALEXANDER, poet and prose-writer, was born about 1475, most probably in Scotland. He may have studied at either or both of the English universities, and then travelled in France and Italy. Some time before 1508 he was appointed, through Bishop Cornish, a priest of Ottery St Mary, Devonshire. About 1511 he became a monk of the Benedictine monastery of Ely; later he assumed the Franciscan habit at Canterbury; and he died at Croydon in June 1552, six weeks after he had been presented to the rectory of All-Hallows, London. His claim to notice rests chiefly upon his famous poem, *The Ship of Fools of the Worlde*—partly a translation, and partly an imitation of the German *Narrenschiff* by Sebastian Brandt (q.v.)—printed by Pynson in 1509. He also published *The Castell of Labourer*, *The Egloges* (Ecolgues), a translation of Sallust's *History of the Jugurthine War*, &c. See the admirable edition of the *Ship of Fools* by T. H. Jamieson (2 vols. Edin. 1874).

Barclay, JOHN, author of the *Argenis*, was born in 1582, at Pont-à-Mousson in Lorraine, where his father, a Scotsman, was professor of Law. Owing, it is said, to persecution on the part of the Jesuits, he came with his father to England about 1603, and either in that year, or two years later, he published his *Euphormionis Satyricon*, a politico-satirical romance, chiefly directed against the Jesuits, supplements to which were the second part (1607), the *Apologia* (1611), and the *Icon Animorum* (1614). In 1616 he left England, and went to Rome, where he died, a good Catholic, in 1621. In the same year appeared his *Argenis*, according to Cowper, 'the best romance that ever was written.' It was written in Latin, and has been translated into Spanish, Italian, Polish, &c. There are no fewer than three English versions, the last by Clara Reeve in 1772. It is a political allegory, containing clever allusions to the state of Europe, more particularly of France, during the time of the League; and has merited the admiration of readers as dissimilar as Richelieu, Leibnitz, and Coleridge. See Dupond, *L'Argenis de Barclai* (1875), and the bibliography by Dukas (1880).

Barclay, JOHN, M.D., anatomist, was born 10th December 1758, in Perthshire, Scotland, and died in Edinburgh, 21st August 1826. He was educated at St Andrews, and studied for the ministry, but afterwards devoted himself to medicine. He obtained the degree of M.D. from the university of Edinburgh in 1796, where he became a private lecturer, and in 1804 he was formally recognised as lecturer on anatomy and surgery by the College of Surgeons. He was mainly instrumental in founding the Dick Veterinary College in Edinburgh. He published between 1803 and 1822, *A New Anatomical Nomenclature, Muscular Motions, Arteries of the Human Body, and An Inquiry into the Opinions concerning Life and Organisation*.

Barclay, REV. JOHN (1734-98), the founder of the Bereans (q.v.), was an uncle of the preceding.

Barclay, ROBERT, the celebrated apologist of the Quakers, was born at Gordons town in Morayshire, December 23, 1648. His father belonged to an old Scottish family, had served under Gustavus Adolphus, and was in some trouble after the Restoration for his conformity with Cromwell. Robert was educated at the Scots College at Paris, of which his uncle was rector; and here he withstood every temptation to embrace the Roman Catholic religion, and returned to Scotland in 1664, in compliance with the wish his mother had expressed on her death-bed. In 1667 he followed the example of his father—a convert in 1666—and joined the Society of Friends, for reasons more highly respected in our day than in his own. He states in his *Treatise on Universal Love*, that his 'first education fell among the strictest sort of Calvinists,' those of his country 'surpassing in the heat of zeal not only Geneva, from whence they derive their pedigree, but all the other so-called reformed churches;' that shortly afterwards, his crossing to France had thrown him among the opposite 'sect of papists,' whom, after a time, he found to be no less deficient in charity than the other; and that, consequently, he had refrained from joining any, though he had listened to several. The ultimate effect of this was to liberalise his mind, by convincing him of the folly and wickedness of religious strife. In both Calvinists and Catholics he found an absence of 'the principles of love,' 'a strictness of doctrine,' and a 'practice of persecution,' which offended his idea of Christianity, as well as the gentleness and generosity of his nature. He therefore allied himself gladly to this new sect, whose distinguishing feature was its

charity and pure simplicity of Christian life, and soon became one of its most devoted adherents and its ablest advocate. He continued to prosecute his studies assiduously, married Christian Mollison in 1670, and became involved in controversies in which he showed his superiority in logic and learning, no less than in tolerance. In 1672 he startled the self-complacent city of Aberdeen by walking through its streets in sackcloth and ashes. He suffered much persecution, and was frequently imprisoned, but at last found protection in the favour of the Duke of York, afterwards James II. He made several journeys into Holland and Germany, the last in company with William Penn and George Fox. He was one of the Quakers—originally twelve in number—who acquired the proprietorship of East New Jersey (in which toleration was to be established) in 1682 and was appointed its nominal governor. He was a frequent visitor to London, but continued to live at Urie, where he died, leaving three sons and four daughters, October 3, 1690. His estate remained in his family till the death of Captain Barclay, the famous pedestrian, in 1854. Barclay's works were collected in 1692 in a folio volume, entitled *Truth Triumphant*, republished in 3 vols. in 1717-18. Of these the greatest is *An Apology for the True Christian Devinity, as the same is held forth and preached by the People called in scorn Quakers* (1678). It contains a statement and defence of fifteen religious propositions peculiar to the Friends. The leading doctrine which runs through the whole book is, that divine truth is made known to us not by logical investigation, but by intuition or immediate divine revelation to the heart of the individual; and that the faculty by which such intuition is rendered possible is the 'internal light,' the source of which is God, or, more properly, Christ, 'who is the light that lighteth every man that cometh into the world.' This light is given to every man, but is obscured by human corruption. The authority of the Scriptures gives only a 'secondary rule,' subordinate to that of the inward light, and the ordinary Augustinian notions of justification, perfection, and perseverance, imply rather a change in the outward relations than a transformation of the soul that accepts the divine light. The identity of this in the main with the teaching of a large school within the English church of the present day, is obvious. The fourteenth proposition deals with the question of toleration and the right of freedom for the conscience, his assertion of which fits well with his theory of divine light within all men of whatever creed or country. The author distinguishes carefully between the divine light and natural reason; but others who identify the two, find in Barclay's great work a series of excellent arguments for deism. Indeed, he was accused of deism even in his own time, and he is mentioned with favour by Voltaire. Brown of Wamphray, in his *Quakerism the Pathway to Paganism* (1678), denounces the 'hellish neo-paganism' of this 'devil in Samuel's mantle,' and speaks of his 'serpentine venom' as 'sugared over with fair speeches.' Barclay's famous work has often been reprinted, and has been translated into most of the European languages. His *Treatise on Universal Love* (1677) was the first of that long series of noble and gentle remonstrances against the criminality of war that has so honourably distinguished the Society of Friends.

Barclay-Allardice, ROBERT, known as Captain Barclay, the pedestrian, was born in 1779, and succeeded to the estate of Urie, near Stonehaven, in 1797. He entered the army (1805), and served in the Walcheren expedition (1809), but afterwards devoted himself to agriculture, cattle-breeding, and the claiming of earldoms (Airth, Strathearn, and

Menteith). He died 8th May 1854. His great feat of walking 1000 miles in 1000 consecutive hours took place at Newmarket in June to July 1809. See W. Thom's *Pedestrianism* (1813).

Barclay de Tolly, MICHAEL, PRINCE, a famous Russian general, was born in 1761 in Livonia. He was descended from the same Scottish family to which John Barclay the poet and the Quaker apoloquist both belonged, two of the branches of which had settled in Mecklenburg and Livonia. Entering a Russian regiment of cuirassiers as a sergeant, he fought with great bravery in the Turkish war of 1788-89, in the campaign against Sweden in 1790, and in those against Poland in 1792 and 1794, and rose rapidly in rank. He commanded Benningsen's advanced-guard at Pultusk in 1806; and lost an arm at the battle of Eylau. Scarce recovered from his wound, he took part in the war in Finland, defeated the Swedes, crossed the Gulf of Bothnia on the ice at the head of 6000 men, and quickly forced the enemy to sue for peace. Spite of his unpopularity as a German with the Russian national party, he was appointed minister of war by the Emperor Alexander in 1810—an office which he held till 1813. In 1812 he was made commander-in-chief of the army of the west. Here, though face to face with the greatest general and one of the finest armies of modern times, he showed himself such a consummate tactician that his defeats never became disasters. The plan of defence during the campaign is generally ascribed to his insight and wisdom. His advice was to avoid battles and retreat into the interior before the French, leaving the country behind them a desert, and thus the Russian army would ever become stronger as the French grew weaker. He had offered the same advice after Eylau in 1807, but Bagration, the impetuous leader of the second army, was eager to assume an offensive attitude, and the army, weary of constant retreat, supported him against his more cautious colleague. Accordingly, Barclay de Tolly was forced to give battle at Smolensk, and in consequence of his defeat had to yield the supreme command to Kutusow until the death of the latter gave it to him again. At Moskwa he commanded the right wing; at Bautzen he commanded the entire army. He afterwards commanded the Russian army in Bohemia, and took part in the battles of Dresden, Kulm, and Leipzig. He was commander-in-chief of the Russian army in France, and in consequence of this was made a prince and a field-marshal. He died 14th May 1818, at Insternburg, on his way to the Bohemian baths. Two or three years before his death, the estate of Tolly or Towie-Barclay, in Aberdeenshire, the old inheritance of his family, was for sale, but he refused to buy it on the ground that his family had been so long expatriated that Scotland was now to them a strange country. Statues of him were erected at St Petersburg in 1837, and at Dorpat in 1846.

Bar-coch'ba, SIMON, the leader of the Jews in their great insurrection against the Romans, under the Emperor Hadrian, from 131-135 A.D. Three times had the oppressed Jews revolted without success, from 115 to 118; and in 130, soon after Hadrian's return from Syria, a new rebellion broke out, for which they had been secretly preparing. At the head of it was one Simon, who assumed the name of Bar-coch'ba—i.e. 'Son of the Star,' pretending that the prophecy was to be fulfilled in him, 'There shall come a Star out of Jacob' (Numb. xxiv. 17). He fought at first with great success against the Romans, and even obliged them to evacuate Jerusalem, where he was proclaimed king, and caused coins to be struck with his name. The war spread over all the country of Palestine,

and fifty towns, besides many villages and hamlets, came into the possession of the Jews. But on the arrival of Hadrian's general, Julius Severus, Jerusalem was retaken; and in August 135, Bethor, the very last strong fortress held by the Jews, was stormed by the Romans. Bar-coch'ba fell on the day of this bloody conquest. Many thousands of Jews perished in this last attempt to regain political independence, and many were executed after its failure. From this last fatal struggle dates the final dispersion of the Jews over the face of the earth.

Bard, a fortress and village in the Italian province of Turin, situated on the left bank of the Dora Baltea, about 23 miles SE. of Aosta. When the French crossed the St Bernard in 1800, the fortress of Bard, manned by 400 Austrians, maintained for ten days a resistance to their further advance into Italy. Ultimately Napoleon contrived to elude the vigilance of the garrison, and passed by a mountain-track during the night. Bard was taken a short time after by the French, and razed, but in 1825 it was restored.

Bard, hoise armour of metal plates; also plate-armour for a man-at-arms.

Bard, the name, known to the Romans since 200 B.C., by which the Gauls and other Celts designated their minstrels. Like the Scôps of the Anglo-Saxons, and the Skalds of Scandinavia, the bards celebrated the deeds of gods and heroes at religious solemnities, and the festivities of princes and nobles, accompanying their recitations with the harp or Crwth (q.v.); they excited the armies to bravery, preceded them into the fight, and formed the heralds of princes and the mediators of peace. The institution early disappeared among the Gauls, but lingered long in Wales, Ireland, and Scotland. The bards formed a hereditary order, and exercised a decided national influence. The minstrels among the Celts, as among the Germans, were the organ of the people, and the channel of all historical tradition. It is supposed that in Wales, about 940 A.D., their privileges were defined and fixed by the laws which bear the name of King Howel Dha; and in 1078 the whole order is said to have been reformed and regulated anew by Gryffith ap Conan. At Caerwys, Aberfraw, and Mathraval, there were held from time to time great competitions in minstrelsy, called Eisteddfods (q.v.), at which the judges were appointed by the prince. When Wales was conquered by Edward I. (1284), the bards lost their privileges, and were, according to tradition, persecuted and put to death; but succeeding princes countenanced the institution, and Eisteddfods were repeatedly held under royal commission down to the reign of Elizabeth. See WELSH LANGUAGE AND LITERATURE.

In Ireland, the bards are believed to have been a hereditary guild, divided into three classes—the *Fíle**dha*, who sung in the service of religion and in war, and were the counsellors and heralds of princes; the *Breitheamh**haim*, who recited or chanted the laws; the *Seánachaidh**he*, who were chroniclers and genealogists to princes and nobles. Their ample privileges and endowments of land gave them an exorbitant influence, which both princes and people had sometimes to rise against and curb. The great skill of the Irish bards on the harp was acknowledged everywhere. After the conquest of Ireland by Henry II., the profession began to sink. Still many of the chiefs maintained bards in their families, whose songs and legends kept up the national feeling. This occasioned several measures of the English rulers against the Irish bards; Elizabeth ordered the bards that were captured to be hanged, as the instigators of rebellion. Turlough O'Carolan, born 1670, died 1737, is reckoned the

last Irish bard; his poems were translated into English by Furlory. Other lays of the bards were translated by Miss Brooke, *Relics of Irish Poetry* (1789) and Hardiman, *Irish Minstrelsy* (1831). See Douglas Hyde's *Literary History of Ireland* (1899).

The bardism of Scotland may be conjectured to have been similar to that of Ireland; but little is certainly known of the subject beyond the fact that there were poets or bards of different degrees in the Highlands down to the 17th century. In various Scottish enactments from 1449 onwards, bards were coupled with 'sorners' and 'masterful beggars,' as liable to hanging or burning on the cheek.

The name of bard was unknown among the Germanic nations; though a corrupt reading in some MSS. of the *Germania* of Tacitus (*barditus* for *baritus*, 'war-cry') led Klopstock and others to write wild religious and war songs, which they called 'bardeits,' under the notion that they were restoring a branch of the national literature.

Bardesa'nes (properly, Bar-Daisan), a Syrian, the 'last of the Gnostics,' was born at Edessa in 154, and died in 222. He diffused his opinions through the medium of hymns, of which he is reckoned the earliest writer in Syria. These hymns, fragments of which are still extant, exhibit a rich and pure fancy. His *Gnosis* was not purely dualistic. He did not consider evil the eternal coefficient of good, but merely the result of a temporary reaction of matter on spirit. Yet, inexplicably enough, he maintained the devil to be a self-existent, independent being. He denied the doctrine of the resurrection of the body, and in conformity with such a conviction, asserted that Christ's body was not real, but only an illusive image brought down from heaven. See Hilgenfeld's *Bardesan* (1864).

Bardwan, or BURDWAN (but correctly Bar-dhamāna), a city of Bengal, 67 miles from Calcutta, headquarters of a district of the same name. It contains a palace of the Maharajas, and a large collection of temples. The Mahāraj-adhiraj Bahadur is the largest land-revenue payer in India. The incidence of the land revenue on his estate is specially high for Bengal. Population, 40,000.—The district has an area of 2700 sq. m., and a population of 1,500,000 inhabitants. It exports silk, rice, tobacco, jute, also iron and coal—the latter chiefly brought from the mines of Raniganj. Since the opening of the East Indian Railway, many small villages have been transformed into thriving centres of trade. The *division* of Bardwan (headquarters at Chinsura) has an area of 14,000 sq. m., and a population of about eight and a half millions.

Barebone's Parliament, the 'Little Parliament' summoned by Oliver Cromwell, met 4th July 1653, and was so nicknamed from one of its members, Praise (not Praise-God) Barbon or Barebone, a leather merchant. It consisted of 139 persons, 'faithful, fearing God, and hating covetousness,' but mostly of very destructive social principles. These began by abolishing the Court of Chancery, and were proceeding to abolish tithes, to the alarm of the more moderate members, and of Cromwell himself, who dissolved the parliament on 12th December of the same year.

Barèges, a small watering-place in France, in the department of Hautes-Pyrénées, about 12 miles SE. of Pierrefitte railway station. Situated at a height of over 4000 feet above the sea, great part of it is buried in snow throughout the winter, consequently few live here save in summer and autumn. The place consists of but one long dull street and about eighty houses, yet as many as 1200 bathers come here every year during the four months' season. The mineral water for which it is celebrated contains principally sulphide of sodium, with portions of carbonate,

chloride, and sulphate of sodium, nitrogen, and sulphuretted hydrogen. Its efficacy in the cure of wounds, rheumatism, stiffness of joints, and scrofulous complaints is said to be very remarkable. The French government has erected here two hospitals for soldiers.

Barèges, mixed tissues adapted for women's dresses, called in France *Crêpe de Barèges*, first manufactured at Luz, in the Pyrenean valley of Barèges, but now principally produced at Bagnères de Bigorre. Bareges are usually a mixture of silk and worsted; an inferior kind being composed of cotton and worsted. They vary in colour, and are sometimes light in tint, with printed patterns. All are of a slight fabric for summer wear.

Barègine, a slimy or gelatinous deposit in the hot sulphurous springs at Barèges, Aix-la-Chapelle, and elsewhere, which is found on microscopic examination to consist of masses of rods and filaments of *Beggiatoa* (see BACTERIA) mixed with grains of reduced sulphur. The thermal waters apparently act as culture-fluids for the atmospheric germs, and it is to the vital activities of these fungi that Cohn ascribes the evolution of sulphuretted hydrogen from the spring.

Bareilly, or BARELI, the chief city of a district and a division in Rohilkhand, United Provinces of Agra and Oudh, India, is pleasantly situated in a well-wooded plateau above the Ramganga, 152 miles E. of Delhi. Cotton, grain, and sugar are the staples of commerce; furniture and upholstery the manufactures. The chief industry is sugar-refining. Bareilly was a centre of disaffection during the Mutiny, but was taken in May 1858. Pop. (1881) 109,844; (1921) 127,939.—The district has an area of 1580 sq. m., contains 1,000,000 inhabitants, and is bounded on the N. by Tarai, and on the E. by Nepal. The area of the division is 10,720 sq. m.—a fertile tract, especially noted for the production of sugar-cane. (*Roy Bareilly*, *Rae Bareilly*, or *Rai Bareilly* is the name of a different town, district, and division, also in the United Provinces, near Lucknow.)

Barentz (or BARENTS), WILLIAM, a Dutch navigator, who acted as pilot in connection with several expeditions which sailed from Holland in search of a North-east passage, and who died off the coast of Nova Zembla, 20th June 1597. The first vessel, fitted out by the city of Amsterdam, sailed from Holland, June 5, 1594, reached the north-east extremity of Nova Zembla, and returned. A second expedition of seven vessels, sent out in the following year, started too late in the season to be successful; the third expedition of two ships, starting in May 1596, reached Spitsbergen, when the two parted. Barentz's vessel, doubling the north-east of Nova Zembla, encountered ice, and unable to sail eastward, turned towards the south. Barentz and his crew were frozen up in Ice Haven on September 1st, where they spent a miserable winter. On 13th June 1597 the crew left these desolate shores in two boats, and Barentz died shortly afterwards. The survivors reached the shores of Lapland, and were rescued. Captain Carlsen found Barentz's winter-quarters undisturbed in 1871, after a lapse of 274 years, and in 1875 part of his journal was recovered by another explorer. The Barents Sea between the European mainland and Nova Zembla, Spitsbergen, and Franz-Josef Land, still preserves the name of this brave mariner. See Van Campen's *Barents' Relics* (Lond. 1877).

Barère de Vieuzac, BERTRAND, a French revolutionist and regicide, born at Tarbes, 10th September 1755. First an advocate at Toulouse, he acted as a deputy in the National Assembly, and was sent by the department of the Hautes-Pyré-

nées to the National Convention in 1792. He soon became active as a journalist, and attached himself to the 'Mountain,' supporting it with eloquence of such a flowery and poetical style as afterwards earned him the name of the 'Anacreon of the guillotine.' He was president of the Convention when the sentence was passed upon Louis XVI. He rejected the appeal to the people, and gave his vote with these words: 'The law is for death, and I am here only as the organ of the law.' Though a supporter of Robespierre, he concurred in his downfall, yet this did not save him from being impeached and sentenced to transportation. His sentence was not carried into effect, and he shared in the general amnesty of the 18th Brumaire. Elected a deputy during the Hundred Days, he was banished after the second restoration. He betook himself to Brussels, where he devoted himself to literary work till the revolution of July permitted his return. In the year 1832 he was once more elected as a deputy by the department of the Hautes-Pyrénées; his election, however, was annulled, on account of errors of form, whereupon the government called him to be a member of the administration of that department, which office he continued to hold till 1840. He died on 14th January 1841. His *Memoires* were edited by Hipp. Carnot (1842; trans. 1897). Barère was one of the most graceful and consummate liars in history. His masterpiece in this kind is his famous account of that glorious suicidal sinking of the ship *Vengeur* in 1794, which is still dear as a heroic story to the French people, and was described in glowing words, as a real historical exploit, by Carlyle in the first edition of his *French Revolution*. See Carlyle's *Miscellanies*.

Baretti, GIUSEPPE MARC ANTONIO, an Italian writer, born at Turin in 1719, was destined for the priesthood, but devoted himself to literature. In 1751 he established himself as a teacher of Italian in London, where in 1757 he published the *Italian Library*, giving an account of the most eminent Italian authors and their works. He afterwards spent the six years 1760-66 on the Continent, where he published a readable book of travels, and in Venice, under the name 'Aristarco Scannabue,' started the *Frusta Letteraria*, the 'literary scourge,' which was suppressed after the twenty-fifth number. In 1769 he stabbed a Haymarket bully in self-defence, and was tried for murder, but was acquitted—Dr Johnson, Burke, and Garrick testifying to the excellence of his character. He died in London, 5th May 1789. His thirty-six works included a standard Italian and English Dictionary (1760). His reputation is still high in Italy. See Birkbeck Hill's edition of Boswell's *Johnson* (1887), and the *Life* by Lacy Collinson Morley (1909).

Barfleur, a seaport town of France, in the department of La Manche, about 15 miles E. of Cherbourg. It is now a place of little importance, but it is noteworthy in history as the port whence, in 1066, William the Conqueror set out on his invasion of England. Population, 1000. Close by, on the ill-famed *Pointe de Barfleur*, stands the highest lighthouse in France, 271 feet above the sea.

Barfrush. See BALFRUSH.

Bargain and Sale, in the law of England, is a mode of conveyance whereby property, real and personal, may be assigned or transferred for valuable consideration. In England the property of goods passes before delivery by such a sale, as opposed to the executory contract of sale where the passing of the property is postponed. The expression is chiefly important in connection with the conveyance of real estate. Such a bargain by the Statute of Frauds must be in writing.

No particular form of words is essential to the validity of a bargain and sale; 'bargain and sell' are the words of transfer ordinarily used. The pecuniary consideration is held to be a mere matter of form, and any trivial sum may be inserted in the conveyance. The effect of a bargain and sale not followed by a formal conveyance, was that the seller holds the legal estate for the benefit of the purchaser. The Statute of Uses transferred the legal estate to the purchaser in all such cases, and it thus became possible to convey the legal estate without making formal delivery of the land. To prevent secret conveyances in this form, the Statute of Enrolments enacted that a bargain and sale should not pass a freehold unless made by deed enrolled within six months after its date. Since the date of this statute, bargain and sale has not been used for conveying freeholds, but it is still a common form for conveying estates less than freehold, as a mortgage for a term of years, or the common lease and release.

There is no such title to land or other real estate in the Scots law, but in that system there may be a contract as to land, the evidence of which must be in writing, as in holograph missives or tested minute of sale.

In the United States, bargain and sale is a contract to sell land for money or its equivalent, whereupon a use arises in favour of the bargainee to whom the seisin is transferred by force of the Statute of Uses; it is the most common form of conveyance of land in the United States. All things for the most part which may be transferred by deed, may be transferred by this mode of conveyance, and by it an estate in fee for life or for years may be created.

Barga Pass, a hill-pass in the north of Bashahr State, Punjab, leading across the Himalayas. It is the lowest of three passes within a mile's distance, and its highest part is about 15,000 feet above the sea.

Bargé, an ancient town of Piedmont, in the province of Cuneo, 30 miles SW. of Turin, with slate-quarries. Pop. 2000.

Barge, a name applied to vessels of various forms: (1) A pleasure-boat or boat of state, elegantly fitted, furnished with a band of rowers, used on state occasions. The college 'barges' at Oxford are similar boats, but are permanently moored. Such, too, are the 'house-boats' that have come so much into vogue on the Thames of recent years. (2) A flat-bottomed freight-boat, with or

Oxford University Barge.
(From a Photograph by Frith.)

without sails, used on our rivers and canals, either in conveying goods from one town or quay to another, or to aid in bringing stores to and from ships. Barges without sails are often called *lighters*. (3) A long narrow boat belonging to a man-of-war, for

the occasional use of the superior officers. (4) In the United States also, a double-decked passenger and freight vessel, without sails or power, and towed by a steamboat.

Barge-board, a board extending along the edge of the gable of a house to cover the rafters and

Barge-board.

keep out the rain. These barge-boards were often very richly ornamented, particularly in the 14th and 15th centuries.

Barham, RICHARD HARRIS, author of the *Ingoldsby Legends*, was born at Canterbury in 1788. In 1795 he succeeded to the manor of Tappington, and in 1802 he met with an almost fatal coach accident whilst on his way to St Paul's School, an accident that partially crippled his right arm for life. He entered Brasenose College, Oxford (1807), was ordained (1813), and in 1821 received a minor canonry of St Paul's Cathedral, three years later becoming incumbent of a City church, and priest in ordinary of the chapels royal. His first novel, *Baldwin* (1819), fell still-born; his second, *My Cousin Nicholas* (1834), appeared in *Blackwood's Magazine*; and with the commencement of *Bentley's Miscellany* in 1837, he began his series of inimitable burlesque metrical tales under the pen-name of Thomas Ingoldsby. They were first collected into a volume in 1840, and the third series was published in 1846. *The Ingoldsby Legends* at once became popular from their droll humour, fine irony, varied and whimsical rhymes, and quaint out-of-the-way learning. His lyrics were published separately in 1881. Barham was a frequent contributor to the *Edinburgh Review* and *Literary Gazette*. He died in London, June 17, 1845. See his *Life and Letters* by his son (3rd ed. 1880), and the introduction by his daughter, Mrs Bond, to the 88th edition of the *Legends* (1894).

Bar-Hebræus. See ABULFARAJ.

Bari, a city of Italy, capital of an Italian province, is situated on a peninsula in the Adriatic, on the coast railway, 277 miles SE. of Ancona, and 122 NW. of Otranto. The streets of the old town only are confined and gloomy. Bari is the see of an archbishop, and has manufactures of cotton, silk, linen, and soap. Its quay and roadstead are good, and a brisk export trade is carried on. The massive old castle is of Norman origin. The old church, San Nicola, a noble specimen of the Lombard style of architecture, founded in 1087, contains some interesting monuments and relics. The still older cathedral of San Sabino has been ruined by the barbarous improvements it was subjected to in the 18th century. It contains pictures by Paul Veronese and Tintoretto.

The population is over 100,000. Bari, the *Barium* of the Romans, was an important place to the Greeks as early as the 3rd century B.C. It was made a *municipium* by Nero, was under the Saracens for some years in the 9th century, and was taken from the Greeks after a three years' siege by the Norman, Robert Guiscard, in 1071. Later it fell to the Pope, but revolted in 1228 to join the cause of the emperor, Frederick II. In 1558 it became part of the kingdom of Naples.—The province of Bari is badly watered, but wonderfully fertile, and produces fruit, wine, olive-oil, and nuts, as well as grain. Its salt and nitre works are also very important. Area, 2000 sq. m.; population, 900,000.

Bari, a race of Sudanese negroes on both sides of the White Nile, whose chief town is Gondokoro. They are tall and active, cultivate durra, and keep numerous herds of cattle; by the slave-dealers they were reputed treacherous and bloodthirsty; and they proved their manhood and valiant energy in resisting both the slave-raiders and the gradual encroachments of Egyptian officials till, in 1871, Baker Pasha conducted an expedition against them, and, after a short war, added their country to the dominions of Egypt. The language of the Bari is nearly allied to that of the Dinka and other languages of the Nile. See AFRICA.

Bariatinski, ALEXANDER IVANOVICH, PRINCE, a Russian field-marshal, born in 1814, and educated with the future tsar, Alexander II. While a young officer in the hussars, some love-passages with a grand-duchess caused his transference to the Caucasus, where his successes against the famous Shamyl (q.v.) secured him in 1852 the rank of lieutenant-general. On the accession of Alexander II., he returned to St Petersburg, and in 1856 was appointed to the command of the army of the Caucasus. Three successful campaigns were closed by the storming of Ghunib, and the capture of Shamyl. For these services he was made a field-marshal. His health, however, had broken down, and the remainder of his life was passed chiefly abroad. He died in Geneva, March 9, 1879.

Barilla, an impure carbonate of soda, procured from plants which grow in salt-marshes or other places near the sea; it forms a considerable article of commerce, being used in the manufacture of soap and of glass, and for other purposes in the arts. The greatest quantities of barilla are produced in Spain and the Balearic Islands; but the Canary Islands, Italy, and France also contribute a part. It is procured by burning the plants, much in the same way that seaweeds once were largely burned on the coasts of Scotland for kelp. The Spanish barilla is most esteemed, especially that produced near Alicante, where it is chiefly obtained from the *Salsola sativa*, a plant of the natural order Chenopodiaceæ, systematically cultivated in grounds close by the sea. Other species of *Salsola* (Saltwort, q.v.), and glasswort, are also burned for barilla. The manufacture of barilla declined when it was discovered how to make soda from common salt.

Barima, a river (navigable for some 80 miles) which rises in the Imataka Mountains, flows through NW. British Guiana into Venezuela, and joins the sea east of the Orinoco delta. Its valley contains gold.

Barine, ARVÈDE, the pen-name of Madame Cécile Vincens (1840-1908), a Parisian authoress with an idiomatic style, who translated from Tolstoy and wrote a series of brilliant essays, sketches, and biographies (Bernardin de St Pierre, De Musset, 'La Grande Mademoiselle,' &c.).

Baring, the name of a great financial and commercial house. The father of its founder was

Johann Baring, a German cloth manufacturer (son of Franz Baring, pastor at Bremen), who in 1717 started a small business at Larkbear, near Exeter. Two of his sons, Francis and John (1730-1816), established in London in 1770 the now existing house.

SIR FRANCIS (1740-1810), born at Larkbear, was deaf from his youth; but receiving a commercial training in the house of Boehm, he overcame all obstacles, and founded a large and successful business. He became a director of the East India Company, and being a staunch supporter of Pitt, was created a baronet by that minister in 1793. He represented Grampound, Chipping Wycombe, and Calne in parliament from 1784 to 1806. He took an active part in the discussions relative to the Bank Restriction Act of 1797, and wrote on this and other financial subjects. At the time of his death he was reckoned the first merchant in Europe, and had amassed a fortune of nearly seven millions.

SIR THOMAS BARING (1772-1848), eldest son of the above, succeeded his father in the baronetcy. He appears to have taken no active part in the business of the firm, being chiefly remarkable as an admirer and encourager of art. His magnificent collection of paintings was dispersed by public sale after his death in April 1848. His fourth son, Charles Thomas (1807-79), Bishop of Durham, was a strong Evangelical, noted for his piety and personal kindness.—FOR ALEXANDER BARING, see ASHBURTON (LORD).

SIR FRANCIS THORNHILL BARING (1796-1866), son of Sir Thomas, was educated at Oxford. Under successive Whig governments, he was a Lord of the Treasury, Secretary to the Treasury, Chancellor of the Exchequer, and First Lord of the Admiralty; and he was created Baron Northbrook in 1866. His son, THOMAS GEORGE, second Lord Northbrook (1826-1904), was successively a Lord of the Admiralty, Under-secretary of State for India, Under-secretary of War, Governor-general of India (1872-76), and First Lord of the Admiralty (1880-85), and was created an earl in 1876.

SIR EVELYN BARING, LORD CROMER (1841-1917), served in the Royal Artillery, became secretary to his cousin the Earl of Northbrook, one of the Controllers-general of Egyptian Finance (1879), Finance Minister of India (1880), and resident minister (nominally 'agent and consul-general') in Egypt in 1883-1907, and was created a baron in 1892. To his firm, generous, and enlightened policy is largely to be attributed the enormous progress of Egypt in well-being during the reign of Abbas II. (q.v.; and see EGYPT). The administration of justice was greatly improved, the finances regulated, and the burdens of the inhabitants lightened; public works—especially irrigation from the great Nile reservoir at Assuan—vastly promoted agriculture; trade developed; and a new army was created. He was made an earl in 1901, retired in 1907, published *Modern Egypt* (1908), *Abbas II.* (1915), &c., and took part in British politics as a Liberal Unionist and free-trader.

THOMAS BARING (1799-1873), brother of the first Lord Northbrook, sat as a Conservative from 1835. In 1835 EDWARD CHARLES BARING (1828-97), then head of the firm, was created Baron Ravelstoke. In 1890 the firm just tided over a severe crisis.

Baring-Gould, SABINE (1834-1924), an active litterateur in widely different fields, was born at Exeter of an old Devonshire family. In early life he lived much in Germany and France. Educated at Clare College, Cambridge, he was appointed incumbent of Dalton, Thirsk, in 1869; rector of East Mersea, Colchester, in 1871; and in 1881, rector of Lew Trenchard, Devonshire, having also on the death of his father succeeded to the family property there

in 1872. He travelled in Iceland in 1861, and published the results in *Iceland: its Scenes and Sagas* (1862). His most important books are those for which he has drawn upon his wide knowledge of out-of-the-way medieval lore: *The Book of Werewolves* (1865), *Post-medieval Preachers* (1865), *Curious Myths of the Middle Ages* (1866-67), *The Silver Store* (1868), *Curiosities of Olden Times* (1869), and *Legends of Old Testament Characters* (1871). He has written several volumes on Germany, both historical and descriptive, and has made numerous contributions to theological learning, the chief being *The Origin and Development of Religious Belief* (1869-70), a work less lucid than learned; *Lives of the Saints* (15 vols. 1872-77), *Some Modern Difficulties* (1874); *The Lost and Hostile Gospels* (1874); as well as several volumes of practical and pointed sermons, of which perhaps the best are *Village Sermons for a Year* (1875); *The Preacher's Pocket* (1880); *The Seven Last Words* (1884); and *The Trials of Jesus* (1886). A notable book was his account of Robert S. Hawker, *The Vicar of Morwenstow* (1876). His published works (about a hundred) deal with a vast variety of subjects; and he was destined to win celebrity with a series of novels (at first anonymously). *Melelah* (1880) is a story of uncommon power, but unequal and somewhat extravagant; among its successors are *John Herring*, *Court Royal*, *The Gaverocks*, *Richard Cable*, *Ere*, *The Pennycomequicks*, *Arminell*, *Urith*, *Jacquetta*, *Mrs Curgenven* (1893), and *The Queen of Love* (1894). *Grettur the Outlaw* (1889) is based on a saga. *In Troubadour Land* (1891), *The Tragedy of the Cæsars* (1892), *The Songs and Ballads of the West* (with others, 1890), and *Cornish Characters* (1909) are in other departments of literature.

Baringo, an African lake lying N.E. of the Victoria Nyanza, and just N. of the equator. It is about 16 miles long. It has no outlet, though its water is almost fresh.

Barisal is capital of Bakarganj (q.v.) district in Bengal. Heeabouts are head the sounds, referred to breakers, earthquakes, rock-subsidences, &c., but not satisfactorily explained, called 'Barisal guns.'

Barita, a genus of large Australian birds, better called *Gymnorhina*—popularly Magpies, and sometimes 'Piping Crow-shrikes.' The Common Barita (*Gymnorhina tibicen*) feeds mainly on insects, has a melodious note, and can be readily tamed and taught.

Baritone, that species of the human voice which lies between the bass and the tenor, but whose tone-character is more allied to the bass. The compass of a baritone voice is from A on the first space of the bass clef to F above the staff; but the principal notes of the voice are from C to E within that compass; and these should possess the energetic character of a bass voice, and, above all, be produced from the chest, excepting perhaps the highest. In former times the music for this species of voice was written on a staff with the F clef placed on the third line, thus: . The name is also given to

a small Saxhorn (q.v.) in B \flat or C. See also BARYTON.

Barium (symbol Ba, atomic weight 137) is the metallic element present in 'heavy spar' (sulphate of barium) and 'witherite' (carbonate of barium). The metal is very difficult to isolate in a pure state. It has been got as a silver white substance by the electrolysis of molten barium chloride. It decomposes water readily at ordinary temperatures, and, exposed to the air, quickly combines with oxygen, forming the *oxide of barium*, BaO, or Baryta (q.v.), an earth resembling ordinary caustic lime. The sul-

phide is obtained when the sulphate in powder is mixed with finely pulverised coal, and the whole, being placed in a crucible, is raised to a red-heat in a furnace. The chloride is prepared by adding hydrochloric acid to a solution of the sulphide of barium, when sulphuretted hydrogen escapes, and chloride of barium remains behind, and on evaporation of the liquid, is obtained in crystals. Barium is employed in making Oxygen (q.v.). Barium sulphate is used in X-ray diagnosis. The chlorate is used with sulphur and charcoal for preparing green fire. A platinum wire dipped in barium chloride solution imparts a green colour to a flame, the spectrum of barium containing green lines.

Bark. The hard outer covering of any stem is often popularly called bark, or by old botanical writers, cortex. But since in ferns this may be merely a thickening of the outer layers of the cellular envelope, into which the fibro-vascular bundles do not enter, while in monocotyledons the protective layer is not merely a hardening of the epidermis and cellular envelope, but may be firmly interwoven by the fibro-vascular bundles, and in fact indistinguishable from the inner portion of the stem, save as a region so to speak mechanically differentiated for its position, botanists are accustomed to restrict the term bark to the outer portion of the dicotyledonous stem (see DICOTYLEDONS), and especially to that of woody

Fig. 1.—A, Longitudinal section of bark of Dicotyledon (Alder):

a, epidermis with cuticle; b, cork cells; c, thickened cells; d, green cellular layer of loosely placed cells containing chlorophyll; e, hard bast fibres; f, thin-walled cells of soft bast; g, vessels with sieve-plates of soft bast; h, cambium; k, wood with fibres and dotted vessels.

B, The same in transverse section.

and perennial stems. In succulent and herbaceous plants, and young shoots of shrubby or herbaceous ones, the stem structure resembles that of lower plants; the epidermis (which may be sooner or later for practical purposes supplemented or replaced by a subjacent layer of cork) protects the green parenchymatous layer, or *cellular envelope*, which performs leaf functions, and is, in fact, continued upwards through the leaf-stalks into the parenchyma of the leaves. Below this layer we come to the fibro-vascular bundles, which lie simply in a loose but anastomosing ring, or rather cylinder, through the meshes of which the external cellular envelope and the internal pith are in direct continuity. When, however, the dicotyledonous stem becomes perennial, its fibro-vascular bundles continue to grow through the combined multiplication of a central layer of persistently

embryonic cells, the so-called *cambium*; the new cells next the inner or woody portion of the bundle develop into a second layer of wood outside the first; in the same way, the new cells next the outer or bast portion of the bundle form a new layer of bast, of course lying within the first (see BAST), and this process being repeated every spring, as many layers of wood and bast tend to be formed. The formation of bast is, however, usually less regular than that of the wood. This growth of the fibro-vascular bundles limits the outer portion of the cellular matrix, or cellular envelope, from the internal portion or pith much more sharply than before; yet the cellular continuity is still kept up, although the intermediate cells become compressed and elongated into radiating plates, the *medullary rays*. And since the cambium elements of the bundles unite to form a continuous cylindrical layer, it is evident that it is in this region of excessively delicate and thin-walled protoplasmic cells that any mechanical force applied to the stem will cause rupture. Unlike the fibro-vascular bundles of ferns, monocotyledons, or even herbaceous dicotyledons, the bast and wood of the fibro-vascular bundles of the perennial dicotyledonous stem are thus readily split asunder; the woody layers inclosing the pith are thus left exposed, while the bast layers of the bundles, with, of course, their external coverings of cellular envelope, cork, and epidermis, are thus peeled off as a hollow cylinder, while the torn cambium covers both separated surfaces with its wet and viscous remnants. Botanists were formerly wont to regard this mechanically or accidentally separated 'bark' as a distinct structure or organ highly characteristic of dicotyledons, and to distinguish its layers as parts of a natural whole, the epidermis and cork, the cellular envelope, and the bast being respectively termed outer, middle, and inner bark, or epi-, meso-, and endophloem; but these useless and confusing terms are now happily abandoned by careful writers, since they are no more of physiological than of morphological importance. The functions of the different layers of bark are, of course, as entirely distinct as is their origin; the protective function of the epidermis, even with its cuticle, being insufficient, this is supplemented by the corky layer, which grows continuously from a layer of permanently embryonic cells, the cork cambium (see CORK). The cellular envelope continues to vegetate, more or less actively, so long as any light finds its way through the cork layer, air too finding access through loosened openings of this, the lenticels; while the functions of the bast are more complex, and are separately discussed (see BAST). The tannin and other important principles to which bark so often owes its economic importance, are usually to be regarded from the standpoint of vegetable physiology not as reserve materials, but rather as waste products of the plant's activities, which are either contained in the laticiferous vessels, or deposited in the cellular

Fig. 2.—Stem of Laburnum, showing the layers of the bark:

envelope and in the cells of the soft bast by the descending sap. The outer layers of thick barks usually crack as the stem expands within; but in the lace-bark tree of the West Indies (*Lagetta lintearia*) the bast fibres separate regularly, and layer after layer may thus be stripped off, showing lozenge-shaped meshes arranged with beautiful regularity.

Bark for Tanning.—The bark of many trees is capable of being used for Tanning (q.v.), but those kinds are usually preferred which are rich in tannin (see TANNIC ACID), although other properties besides the percentage of tannin determine the value of a bark for preparing leather. Oak bark from *Quercus robur* and *pedunculata* is used more than all other kinds in Europe, and contains from 7 to 11 per cent. of tannin; but the barks of willow, larch, Scots pine, birch, and alder are likewise employed to a considerable extent. That of the Chestnut (*Castanea vesca*) is much esteemed. From both bark and wood of this tree an extract is made in France which is largely used both in tanning and dyeing. In Spain, tanners employ the inner layer of the bark of the cork oak. Tanning extracts are made from several species of oak in the United States, but there the most important source of tanning material is the Hemlock Spruce (*Tsuga Canadensis*), drawn from the primitive forests of the New England States and the region of the great lakes. So vast, however, has been the drain on these resources that supply of bark is becoming exhausted; the price of the raw material has risen rapidly. The *Acacia decurrens*, a tree indigenous to Australia and Tasmania, yields a bark very rich in tannin. The bark of the *Loxopterygium Lorentzii* (Red Quebracho), from Argentina and Brazil, contains 20 per cent. of tannin. Mangrove bark (*Rhizophora mangle*), imported from the East Indies and East Africa, although very rich in tannin, does not form a very satisfactory tanning agent.

The *barking* of trees can be accomplished with facility only in spring, when the sap has begun to circulate. The tree being felled, the rough external lifeless parts of the bark are removed as useless by means of a sharp instrument called a *scraper*; the smaller branches are cut into lengths of about two feet, and their bark is loosened by beating with a mallet, and easily taken off—as boys at the same season make plane-tree whistles; the bark of the trunk and main branches is cut through by a chisel-like instrument, called a *barking-iron*, into similar lengths, each of which is divided longitudinally, and finally stripped off by the aid of mallets, chisels, &c. The bark is sometimes dried in sheds, being placed on narrow shelves or frames in such a way that there may be a very free circulation of air about it; sometimes in the open air, when it is very generally made to rest in a sloping position against trunks of trees placed horizontally at a little distance from the ground, or against racks formed of forked sticks with cross-bars. The larger pieces of bark are placed so as to protect the smaller both from sun and rain. Great care is necessary in the drying of bark, as it is much spoiled if allowed to get mouldy, and is liable to suffer injury from rain or from the exposure of its inner surface to the sun. Bark was, and to some extent still is, a very important source of the revenue derived from many woods and coppices; but in numerous districts of Great Britain oak and other coppice-wood is no longer a profitable forest crop, owing to the low price to which bark has fallen.

Uses of Bark by Savage Races.—In the ethnographical collections of many museums will be found some curious applications of bark. In British Guiana canoes are made of the bark of Purple

Heart (*Copaifera pubiflora*) and of Locust (*Hymenaea Courbaril*). The bark of various species of Birch (*Betula*) is turned to many useful purposes throughout the northern regions of Europe and America. In Russia it is employed for roofing houses, for household basins, jars, and boxes, for shoes, and for canoes; and in North America it has a similar range of uses. Coats are made in British Columbia from pine bark, and a similar garment is formed of an elm bark by the Ainus of Japan. In both cases the bark is woven in strips. Paper is made in different parts of the world from bark, but some kinds are used quite locally (see PAPER); and a kind of soap is yielded by species of *Saponaria* and *Quillaja*. At least one aboriginal tribe in Australia forms its shields of bark. Bread of birch bark is eaten in North-west America; and in Norway and Lapland, in times of scarcity, of that of elm and pine. One of the most primitive cooking-vessels known is made of bark, and is used by the Shompengs inhabiting the interior of the Great Nicobar. The fibrous inner bark (bast) of various trees finds useful applications in many lands. The tapa cloth of the South Sea Islands is beaten out of *Broussonetia papyrifera*. The sack-tree (*Antiaris saccidora*) of the East Indies yields useful bags from its bast, a plug of the stem being left to form the bag-bottom. Lace-bark (q.v.) of Jamaica is from *Lagetta lintearia*. Gardeners' bast is obtained from the lime-tree; and Cuba bast, for tying up cigars, is yielded by the bark of *Paritium elatum*.

Bark in Medicine, &c.—The principal barks used in medicine will be found noticed in separate articles. Amongst them may be noted Angostura Bark (*Cusparia*); Cascarilla (*Cascarilla* Bark, *Eleutheria* Bark); Cascara (*Sagrada* Bark, *Sacred* Bark, *California* *Buckthorn* Bark); Cinchona (*Cinchona* Bark, *Peruvian* Bark, *Jesuits'* Bark, *China* Bark, *Arica* Bark, *Calasaya* Bark, *Crown* Bark, *Condaminea* Bark, *Loxa* Bark, *Ledger* Bark, *Red* Bark, *Quill* Bark, &c.); Cinnamon Bark; Winter's Bark; Witch Hazel (*Hamamelis*); Bebeerine.—When bark is mentioned without any prefix, it is usually Cinchona, otherwise called *Peruvian* or *Jesuits'* Bark, that is intended.

The barks used for dyeing, tanning, and other purposes in the arts, being generally named from the trees which produce them, particular references here are unnecessary.

Bark-beetles, a name loosely applied to a number of Coleoptera which devour the bark of trees. Some of them are members of a family known to entomologists as Xylophaga, or wood-eaters. Many beetles eat wood and such substances, but the forms in question are of special

Fig. 1.—Galleries made in Pine-bark by parent (horizontal) and larvæ (vertical) of *Tomicus typographus*.

importance as forest pests. The adults are not content, like so many other beetles, with finding underneath the loose bark of trees a safe nursery for their larvæ, but bore passages, whence

the larvæ again bore outwards, so doing great damage. Thus the Typographer Beetle (*Tomicus typographus*) bores, pairs, and breeds in the bark of pine-trees, and the larvæ, laid in side recesses, eat their way out laterally, leaving their mark in the form of the curious galleries described by the title 'typographus.' In 1783 this beetle is said to have ravaged the Harz Forest in Germany to the extent of a million and a half of pines, and so revived its popular name of 'the Turk,' by which it is referred to in some old German liturgies. Another Pine-beetle (*Hylurgus pini-perda*) is also a formidable devastator. The maggots develop in recesses from the main tunnel, bore their way through the bark, fly to other trees, and eat into the tender shoots. It is this last habit which is obviously most injurious. The tender bark of the young shoots of the Scotch fir, spruce, larch, &c. is the favourite food of the Pine-weepil (*Hyllobius abietis*), while the maggots form winding galleries in the soft wood under the bark. The Ash-bark Beetle (*Hylesinus fraxini*) is a frequent pest in plantations where thinning and removal of sickly branches is insufficiently attended to. Another common form is the Elm-bark Beetle (*Scolytus destructor*). The female makes a burrow about 3-5 inches long, and lays a hundred or more eggs.

Fig. 2.

a, Galleries made by Elm-bark Beetle (*Scolytus destructor*);
b, the insect, magnified; c, natural size.

The restless grubs bore outwards as usual at right angles to the parent gallery. As a curative device, the outer bark of elms is sometimes removed, with the result of causing a vigorous flow of sap, which in some way or other kills the maggots. See BEETLE, WEEVIL.

Barker, EDMUND HENRY (1788-1839), classical scholar, was born at Hollym, Yorkshire, and studied at Cambridge. He prepared editions of several Latin classics, a translation of Buttmann's *Greek Grammar*, and numerous contributions to periodicals, particularly to the *Classical Journal*; and during a five years' residence with Dr Parr, he was led to undertake a revision of Stephens's *Thesaurus Lingue Græcæ* (12 vols. folio, 1826). This gigantic work was violently assailed in the *Quarterly Review* by Blomfield, against whom Barker wrote his *Aristarchus Anti-Blomfieldianus* (1818). Barker's *Parrana* (2 vols. 1828-29), and his posthumous *Reminiscences of Professor Porson* (2 vols. 1852), give much information about those two famous scholars, but are ill-digested and not entirely reliable. He lost all in a lawsuit, was obliged to sell his fine library, and was thrown into a debtors' prison. He died in extreme poverty.

Barker, HARLEY GRANVILLE, dramatist, actor, and manager, was born in London in 1877. By such plays as *The Voyage Inheritance* (1905), *Waste* (1907), and *The Madras House* (1910), and by his support of the Repertory movement, he has taken active part in the 20th century dramatic revival.

A keen Fabian, he deals powerfully with social problems.

Barker's Mill (Fr. *Roue à réaction*, Ger. *Segner's Wasserrad*), a water-wheel invented by Dr Barker towards the middle of the 18th century.

Fig. 1.

It is represented in its simplest or typical form in fig. 1. A is a wide metal pipe, resting at its lower end, by the steel spindle T, on a metal block B, and kept in a vertical position by the spindle S, at its upper end, which passes through the frame of the machine. Near its lower end, two smaller pipes or arms C, C, are inserted, which project horizontally from it, and these have each, at the outer extremity, a hole cut horizontally in them, opening towards opposite sides. The water is supplied by the pipe P. The reaction caused by the water gushing from the arms, forces them backwards, and gives to the whole machine a rotatory motion. Suppose that the arms were closed all round, the pressure of the water against the sides would be proportional to the height of the water in the pipe A, and the pressure against any particular area of the side would produce no motion of the arm, because an equal pressure is exerted in a contrary direction upon a corresponding area opposite to it. Now, if one of these surfaces be cut out, the pressure against the other, being uncounteracted, forces the arm in the opposite direction to that of the side in which the hole is made. This being done to both arms on opposite sides, two equal pressures are produced, which conspire in generating the same motion of rotation. As soon as motion ensues, centrifugal force comes into play, which, throwing the water out towards the ends of the arms, increases the rapidity of its discharge, and therefore increases the reaction.

The power is manifestly increased by heightening the water-column, or by lengthening the arms—the former increasing the pressure of the water, and the latter increasing the leverage. In the mill shown in the figure, the column in A cannot be advantageously heightened, for the higher it rises, the greater must be the weight which the conical spindle, T, has to sustain, and the greater, consequently, becomes the friction. Hence, in the reaction-wheels now in use, the

Fig. 2.

original Barker's Mill has been so modified as to allow of the water being conducted from the reservoir below the arms instead of above. The power of these machines may be also increased by using curved (fig. 2) instead of straight arms. See WATER-POWER, STEAM-TURBINE.

Barking, a suburban district and market-town of Essex, on the left bank of the Roding, 7 miles NE. of London. It has a fine old church, but scarce any remains of its ancient abbey (founded 670), once one of the richest and most important Benedictine abbeys in the kingdom. Market-gardening, the manufacture of jute, and fishing give employment. Since 1901 Barking is the see of a bishop-suffragan under St Albans. Pop. (Barking Town urban district) 35,500. For the sewage works, see SEWAGE.

Barkly East, a town (pop. 2000; 1000 white) in the NE. of Cape Province, 82 miles SE. of Aliwal North; and **Barkly West** (pop. 2000; 500 white), on the Vaal, the oldest town in Griqualand West, once a diamond-digging centre, are both named from Sir Henry Barkly (1815-98), in 1870-77 governor of the Cape.

Barlaam and Josaphat, one of the most widely-spread religious romances of the middle ages, relating the conversion of the Indian prince Josaphat by the hermit Barlaam, his subsequent resistance of all forms of temptation, and his becoming a hermit. The story, however, has been discovered to be nothing more or less than a Christianised version of the legendary history of Buddha, agreeing with it in all essentials and many details. The very name Joasaph is merely the Buddha under another name, the word *Joasaph* or *Josaphat* being simply a corruption of the word *Bodhisat*. Rhys Davids notes that Joasaph is in Arabic written also *Yūdasaf*; and this, through a confusion between the Arabic letters Y and B, is for Bodhisatva, a title of the future Buddha which is constantly repeated in the Buddhist Birth Stories. The Buddhist origin of the romance was first pointed out by Laboulaye in 1859, but was first proved by Dr Felix Liebrecht in 1860. The celebrated theological writer, John of Damascus, who flourished in the 8th century at the court of the khalif of Bagdad, and afterwards became a monk, is regarded by many scholars (such as Max Muller, Gaston Paris, and Rhys Davids) as the author or rather translator of the original Greek text, which was first published by M. de Boissonade in the 4th volume of his *Anecdota* (Paris, 1832). M. Zotenberg, in his edition of a French version, published in collaboration with M. Paul Meyer in 1864, expressed the opinion, adopted also by Littré, that the work had probably been composed in Egypt, and that it was anterior to Islamism; but M. Zotenberg has since made out a strong case to prove that the Greek text was edited in Syria in the first half of the 7th century by a monk named John, belonging to the convent of Saint Saba, that it contains traces of the religious controversies peculiar to that time, and that this version has been the source of all the translations and known imitations. Whatever its ultimate origin, this romance quickly became popular, and was translated into many European languages. It exists in Latin, French, Italian, Spanish, German, English, Swedish, and Dutch versions, and was even translated as early as 1204 into Icelandic. In the official *Martyrologium* drawn up by Cardinal Baronius for use in the Western Church, and authorised by Pope Sixtus V. (1585-90), appear, under the date of the 27th of November, 'the holy saints Barlaam and Josaphat of India, on the borders of Persia, whose wonderful acts St John of Damascus has described.' It is impossible to discover at what

precise date their canonisation was first decreed, but they appear in the *Catalogus Sanctorum* of Petrus de Natalibus, who was Bishop of Equilium from 1370 to 1400, and it was from this source that Cardinal Baronius adopted their names into his authorised Martyrology. The name of 'the holy Josaph, son of Abenēr, king of India,' appears in the corresponding manual of worship in use in the Greek Church under date of August 26. Professor Max Muller points out that Gotama the Buddha, under the name of St Josaphat, is at the present day officially recognised and honoured throughout Catholic Christendom as a saint of the Church of Christ, and adds that 'few saints have a better claim to the title than Buddha; and no one either in the Greek or in the Roman Church need be ashamed of having paid to Buddha's memory the honour that was intended for St Josaphat, the prince, the hermit, and the saint.' See 'Die Quellen des Barlaam und Josaphat,' in Felix Liebrecht's *Zur Volkskunde* (1879); Max Muller, in vol. iii. of *Chips from a German Workshop* (1880); *Buddhist Birth Stories*, by Rhys Davids (1880); *Barlaam et Josaphat*, by Zotenberg (1866); Halévy in the *Revue de l'Histoire des Religions* (1877); *Barlaam and Josaphat*, by Joseph Jacobs (1896); the translation by Woodward and Mattingly (1914); and for the identity of part of the text with the long lost Apology of Aristides, see the edition of the *Apology* by Rendel Harris and Robinson (1891).

Bar-le-Duc, capital of the French department of Meuse, situated on the river Ornain and the Meuse-Rhine canal, 158 miles E. of Paris by rail. It manufactures cotton and calicoes, and carries on a trade in timber from the Vosges, and in iron, wool, and wine. Bar-le-Duc has a communal college, normal school, theatre, and museum. The church dates from the 15th c. The Chevalier de St George, or Old Pretender, lived here for three years. Ondinot and Exelmans were natives. The ruined castle, long the stronghold of the Dukes of Bar, still overlooks the entrance into Lorraine. Pop. 16,000.

Barletta, a seaport of Italy, on the Adriatic, 34 miles NW. of Bari by rail. It carries on a large trade with Greece and the Adriatic ports. The town has a fine cathedral, an old colossal bronze statue (supposed to be the Emperor Valentinian I.), and ancient castle. Pop. 45,000.

Barley (*Hordeum*), a cereal or grass crop. In ordinary cultivation it is annual, but some hardy varieties are sown in autumn, and except in severe winters, survive and ripen the second year, or if frequently cut green and not allowed to mature seed, may continue to grow for several years. The cultivation of it extends from Italy northwards in Europe. It is better adapted than any other grain to the most northern regions of the grain-growing belt. Some of its varieties are cultivated with advantage where the climate is too cold, or the summer too short, for any other cereal crop. It extends over a wider climatic range than any of the other grains. Barley-meal is used for bread in the north of Europe, but in other parts it is used as a horse-corn, or converted into malt for the making of beer, or deprived of its outer husky covering, and so used as an article of human food called *pot-barley*, or when well rounded and polished in the mill, *pearl-barley*: this is sometimes ground into a fine quality of barley-meal.

By botanists cultivated barley in England is divided into three species. *H. vulgare* (Scotch Bere or Bigg) is distinguished by having the grains in four rows; *H. hexastichum* in six rows; and *H. distichum* in two rows. The spikelets are in threes, of which only the middle one is fertile

in *H. distichum*. *H. vulgare* is only apparently four-rowed, and differs from *H. hexastichum* merely in having a lax instead of a dense ear. A kind with naked seeds, called *Siberian Barley* (*H. coeleste*

Barley:

a, a spike in fruit; b, a cluster of three spikelets in flower, with awns removed; c, a flower with pales; d, a grain (outer side).

of some writers), is cultivated in some parts of Europe, but it is liable to loss in harvest through the grain, which is slightly attached to the straw, shaking off; its straw is regarded as richer food for cattle than that of most other kinds. The *Nepaul* or *Himalaya Barley*, another variety with naked seeds, has been recommended as particularly adapted for cold mountainous regions, yielding good crops in the Himalaya at an elevation of 14,000 feet above the sea.—Of the two-rowed barley there are many varieties, of which the old Common or *Early English*, *Goldthorpe*, *Archer*, *Standwell*, and the *Chevalier* are among the most esteemed, the last being in particular demand for brewing. The *Sprat* or *Battle-dore Barley* (*H. zeocriton*) is also two-rowed, but is distinguished by the grains standing out from the spike, their awns spreading very widely. It is sometimes called *German Rice*, as it swells by boiling in the way that rice does, and for some purposes forms a good substitute for it. It is scarcely cultivated in Britain, but is in much esteem in Germany, and succeeds well in the Alps at an elevation of 3360 feet.

H. pratense and *H. murinum* are barley grasses seen in natural British pastures, but are of no practical value.

Barley is most productive where the climate is moderately dry and warm. No country seems to possess a soil and climate better suited to its growth than many parts of Britain. In former times, this grain was largely employed in the British Islands as human food; and is still used in some parts of Ireland, and in the Highlands of Scotland. Fine malting barley always commands a ready demand in the London market, as well as a high price.

Barley occupies a prominent place in the rotation of the lighter class of arable lands, such as in Suffolk and Norfolk. Fine malting qualities are grown on the turnip-soils of these counties, as well as throughout the south-eastern counties, where the four-course rotation is adopted. In this rotation, the barley follows the turnip-crop. The

ground is worked into a fine tilling condition on the surface, and the seed is either broadcast or drilled in February or March, depending on the weather and the condition of the soil, at the rate of two, three, or four bushels to the acre. On strong land or on very rich soils, the barley-crop is sown after a grain crop, say wheat, as it is found to give a better quality, though not such a heavy crop. In the south of England, barley is allowed to stand till the grain is fully ripe, when it is cut with the scythe or reaping-machine, or most commonly with the binder. In some parts, where the straw is very short and the bulk small, it is not bound up into sheaves, but remains in the swath for a few days, when it is afterwards carted, and stored in barns or oblong stacks. The produce is more influenced by the seasons than that of wheat, as it is liable to suffer from droughts in the early part of the year, and when sown late in very dry seasons, it sometimes remains for weeks and months without germinating, and never comes to a crop. This is all the more striking when it is remembered that if sown under favourable conditions, barley germinates more quickly than any other grain crop. The average British crop is 33½ bushels per acre, but on well-farmed land from 50 to 60 bushels are got per acre. In the peaty soils of the fens of Lincolnshire, barley is not raised, as it is too liable to lodge with the rain; neither is it a favourite crop in the moist climate of the west of England.

Barley has long been grown in Scotland. The level parts of the Lothians and other counties in the east of Scotland, with Moray, Inverness, and Ross in the north, are the districts in which the finest crops are raised. In these districts barley is commonly sown after a portion only of the turnip-break. Morayshire barley has long been famous for its fine sample, and is in great demand with English brewers. On the other hand, in the less genial climate of the western counties, and also of the upper parts of Aberdeenshire, Banffshire, and Perthshire, less barley is sown, and oats frequently succeed the green-crops. In these parts the variety known as bere, or bigg, is preferred to any other, as it is not so liable to lodge, and it withstands wet weather better, and comes earlier to maturity. Bere is the variety which is cultivated by many of the small cotters in the Highlands and islands. Instead of a rotation in which green-crops find a place, a succession of corn-crops is taken, and an occasional rest is given to the soil. The crop, when ripe, is cut by sickle, scythe, or reaping-machine; bound up at once, and put into stocks, to defend it from the weather till ready to cart, and to be built up in neat round stacks. The grain is invariably thrashed out by machinery.

On good turnip-soils the land is enriched by the droppings of the sheep, frequently fed on cake and corn along with the roots, and manure is not often directly applied to the barley-crop. When the turnip-crop is drawn from the land, unless the soil is very rich, the barley should have a dressing of some phosphatic manure, say 3 cwt. or 4 cwt. per acre of superphosphate or bone-flour and 1 cwt. ammonium sulphate, at the time of sowing, or, alternatively to the latter, 1 cwt. of nitrate of soda after the plant is well up.

Barley-break, an old English country game; originally played by three couples, resembling *Prisoner's Bars*. One couple, left in a middle den called 'hell,' had to catch the others, who could break or separate when about to be overtaken. They then changed partners, but when caught, had to take their turn in catching the others. The game is alluded to by Sir Philip Sidney, Suckling, and Herrick. The first half of the name may be from the grain, *barley*, because often played in a

corn-field or barley-field, or it may be *barley* or *parley* (Fr. *parlez*), a truce during a game.

Barleycorn, JOHN, a personification of the spirit of barley or malt-liquor, used in humorous verse as early as 1620 (see the *N.E.D.*). Burns's ballad is more popular than the verse deserves. Under his other name of Allan-a-Maut the same deity was 'honored' in the Bannatyne MS. and elsewhere.

Barlow, JANE, born at Clontarf, became in 1892, by her *Bogland Studies and Irish Idylls*, known as a sympathetic interpreter in prose and verse of Irish scenery and Irish character. Other works are *A Creel of Irish Stories, Ghost Bereft, Irish Neighbours*, and *The Mockers* (1908). She died 17th April 1917.

Barlow, JOEL, an American poet and politician, born in 1754 at Redding in Connecticut. He studied at Dartmouth and Yale Colleges, and was intended for the profession of the law, but served as a military chaplain during the War of Independence. In 1787 he published a poem called *The Vision of Columbus*, which abounds in beautiful passages, but is overburdened with political and philosophical disquisitions, and disfigured by singularities of expression. Barlow came to England in 1788 as agent for a land company, but finding that he was merely a tool of swindlers, he threw up his post, went to Paris, where he signalled himself by zealous republicanism; published in 1792 in London a poem entitled *The Conspiracy of Kings*; and endeavoured also to work upon the public mind in England by political pamphlets. In autumn 1792 he was deputed by the London reformers, with whom he was associated, to proceed to Paris, where he received the rights of French citizenship. He was one of the commission sent by France for the organisation of Savoy. He spent some years on the continent of Europe in political, literary, and mercantile pursuits, in which he made a fortune, and served for a short time as American consul at Algiers. He returned to America in 1805, and was appointed ambassador to France in 1811. He died, 22d December 1812, near Cracow, when on his way to a conference with the Emperor Napoleon at Vilna. In his later years he was gathering materials for a history of the United States. His *Columbiad* (1807), at which he laboured for half a life-time, and the germ of which was contained in his *Vision of Columbus*, is an historical review of events from the time of Columbus to the French Revolution. Other works are his intemperate *Advice to the Privileged Orders* (1791-95), and the would-be humorous poem, *Hasty Pudding*, poor stuff spite of its popularity. See Todd's *Life and Letters of Joel Barlow* (1886).

Barm. See FERMENTATION, BREAD, BEER.

Barmecides, or BARMEKIDES, a Persian family descended from Barmak, a physician and priest of Balkh, in the province of Khorasan, the cradle of the greatness of the Abbaside khalifs, under whom the Barmecides rose to the highest offices in the state. Khálid bin Barmek became prime-minister of Abul Abbas Al-Saffah, the first Abbaside khalif; and his influence enduring through the reigns of Al-Mansur and Al-Mahdi, the latter intrusted him with the education of his son, the celebrated Haroun Al-Raschid. The virtuous and able Yáhyá, the son of Khálid, was made vizier by Haroun upon his accession to the khalifate in 786, and both by his military skill and civil administration contributed largely to the prosperity of the reign. Under his four sons, Al-Fazl, Ja'afar, Mohammed, and Musa, the house rose to a pitch of power and splendour still more dangerous for a subject in the East than in the West. Al-Fazl and Ja'afar especially were virtual rulers of the great empire, which stretched from

Mauritania to Tatar, and were widely celebrated for a splendid magnanimity and generosity that completely eclipsed the khalif. Their downfall was sudden, terrible, and infamous, and stains the great monarch's name with a blot that will never be washed away. After a convivial evening spent in different pavilions, at dead of night the khalif sent for Ja'afar's head, and ordered Yáhyá and Al-Fazl to be flung into prison at Bagdad. According to the historian Al-Tabari, the whole Barmecide family, men, women, and children, numbering over a thousand, were slaughtered with scarce an exception. The motives for this atrocious massacre have never been adequately explained. The popular idea is that given in the *Arabian Nights*. The khalif took such delight in Ja'afar's conversation that he desired his companionship even in the harem, and therefore married him *pro forma* to his eldest sister, the beautiful Abbásah. Ja'afar bound himself by a solemn oath to be his wife's husband in name only, but failed to keep the compact, and the consequences of his folly brought upon his head the merciless wrath of the offended khalif. Some have hinted besides at a taint of heresy, or at least tolerance of heretics, that may have angered the soul of Haroun 'the orthodox.' The only conclusion we can come to is that of Al-Mas'udi: 'As regards the ultimate cause' (of the catastrophe), 'it is unknown, and Allah is Omniscient.' Sa'id ibn Sálím, the grammarian, wrote: 'Of a truth, the Barmecides did nothing to deserve Al-Raschid's severity, but the day (of their power and prosperity) had been long, and whatso endureth long waxeth longsome.' The khalif sincerely repented his enormous crime. From that day he never enjoyed refreshing sleep—he would have given his crown to bring Ja'afar back to life. Nor did the kingdom thrive after the extermination of this wise and enlightened family. Though the khalif had forbidden mention of their name on pain of death, he could not save his ears from hearing their praises, the constant recurrence of which must ever have added a fresh sting to his penitence. The story, 'full of the waters of the eye,' as Firdousi says, took a strong hold upon the Moslem imagination, and has been told and retold a thousand times. See sec. iii. of the 'Terminal Essay,' in vol. x. (1886) of Sir Richard F. Burton's *Thousand Nights and a Night*.

BARMECIDE'S FEAST, an imaginary banquet, from the story in the *Arabian Nights* of one of the Barmecide family who put a series of empty dishes before a starving beggar, giving them magnificent names one after another as he did so. The beggar entered into the humour of his host, making as if he were eating heartily, and at last even getting so much flustered with his imaginary wine as to give him a good box on the ear, whereupon the prince, delighted with the poor fellow's patient humour, set a real dinner before him at once.

Barmen, a busy town in the district of Düsseldorf, Rheinland, extending in the beautiful valley of the Wupper for about four miles from Elberfeld almost to Langenfeld. It consists of a group of villages and three chief parts now connected together—Upper, Middle, and Lower Barmen—which united form the town of Barmen. Nowhere in Germany is so much manufacturing industry accumulated in a single spot. Barmen is the principal seat of the ribbon-manufacture on the Continent. Its fabrics go to all parts of the world. It produces linen, woollen, cotton, silk, and half-silk ribbons, cloth of various kinds, stay-laces, and thread. It has also considerable manufactures of soap, candles, metal wares, buttons, machinery, and pianofortes. There are, besides, in the valley, numerous bleach-fields and Turkey-red dye-works. Barmen is a great mis-

sionary centre, and possesses the mission-house and seminary of foreign missions belonging to the Rhenish Missionary Society. It has grown very rapidly: its population in 1871 was 74,947; in 1890, 116,144; in 1910, 169,214; in 1919, 156,326.

Barmouth, a picturesque and popular watering-place in the county of Merioneth, Wales, at the mouth of the Maw, 10 miles W. of Dolgelly, and 230 miles NW. of London. Opposite, across the river, is Cader Idris, 2914 feet high. Pop. 3500.

Barn (O.E. *bere-ern*, 'barley-place'; contracted *bern*). See FARM.

Bar'nabas, St (properly **JOSES**), mentioned in the Acts of the Apostles as a fellow-labourer of Paul, and even honoured with the title of apostle. He is also supposed to have founded the first Christian community at Antioch. According to tradition, he became the first Bishop of Milan, but Ambrose makes no mention of him among the bishops who had preceded him in that see. He is variously reported to have died a natural death, or to have suffered martyrdom in Rome, Alexandria, or Cyprus, in 61 A.D. His festival is celebrated in the Roman Catholic Church on June 11.

The Epistle ascribed to him bears the strongest internal evidence of being an Alexandrian forgery of the 2d century. This Epistle contains twenty-one chapters, the first four and a half in a Latin version, the rest in the original Greek. Its aim is obviously to strengthen the faith of believers in a purely spiritual Christianity. It commences by declaring that legal sacrifices are abolished, and then proceeds to show, though not in a very coherent or logical manner, how variously Christ was foretold in the Old Testament. In the tenth chapter, it spiritually allegorises the commands of Moses concerning clean and unclean beasts; in the fifteenth, it explains the 'true meaning' of the Sabbath; and in the sixteenth, what the Temple really prefigured. This concludes what may be termed the doctrinal portion of the Epistle; the remainder, which is of a practical character, describes the two ways of life—the way of Light and the way of Darkness, and closes with an exhortation that those who read it may so live that they may be blessed to all eternity. It was ascribed to Barnabas by Clemens Alexandrinus and Origen, and it is found in the *Codex Sinaiticus*. Harnack dates it 131 A.D. See APOSTOLIC FATHERS, APOSTLES (TEACHING OF THE TWELVE).—The apocryphal *Acts of Barnabas* describe his missionary tours and his death. The Gnostic *Gospel of Barnabas* is lost; another, written by an Italian pervert to Mohammedanism, was published by the Clarendon Press in 1907.

Barnabites, a congregation of regular canons of St Paul, founded at Milan in 1530, and sanctioned by Pope Clement VII. two years later. They were so called because the church of St Barnabas in that city was granted them to preach in. Their special duties were—to attend the sick, to preach, to instruct the young, and to take the charge of souls. They soon established themselves in Italy, France, Austria, and Spain, and enjoyed the privilege of teaching theology in the schools of Milan and Pavia. Many eminent men have been sent forth by them. Besides the three usual monastic vows, they took a fourth—not to sue for church preferments. In France and Austria they were employed in the conversion of Protestants. They were expelled from France in 1880; and elsewhere the number of houses has dwindled away. Their founder, Antonio Zaccaria, was canonised in 1897.

Barnacle, a common crustacean, technically known as *Lepas*, and belonging to the group of stalked Cirripedia (q.v.). Like the closely allied sessile acorn-shell, a barnacle may be said to be a

crustacean fixed by its head, and kicking the food into its mouth by its legs. So much are they disguised, however, in their fixed state, that they were formerly referred to the class of molluscs. Careful examination of the adult or inspection of the young

Fig. 1.—Comparison of normal Crustacean type with the degenerate condition of Cirripedes (after Darwin):

The shaded portions correspond. Note the arrested development of the abdomen, and the marked degeneration, though not decrease, of the anterior head region, which forms the barnacle stalk; *m*, mouth.

form at once demonstrates the really crustacean character of the animal. Though the barnacle is very markedly distinguished from the acorn-shell in the development of a fleshy and contractile stalk, the general structure is very much the same (see ACORN-SHELL). There is the same complex valved shell, the same six pairs of waving thoracic

Fig. 2.—A, *Lepas hilti*; B, *Scalpellum rostratum* (after Darwin).

legs, the same cement-gland aiding by its secretion to effect attachment, the same hint of degenerate antennae on the fixing surface, and so on. Like most of the Cirripedia, barnacles are hermaphrodite, while some nearly related forms exhibit minute, almost exclusively reproductive, 'complemental' males in close association with the normal hermaphrodites, or with females.

What has been already noted in regard to the life-history of acorn-shells, applies equally to barnacles. Little *Nauplius* larvae escape from the egg-cases, and after moulting several times, pass into a second stage, like such water-fleas as *Daphnia* or *Cypris*. The first pair of appendages become suctorial, and after a period of free-swimming the pupa settles down on some floating object, mooring itself at first by means of its antennary suckers, but rapidly becoming glued by the secretion of the cement-ducts. After fixing, important changes in structure and position speedily occur, the valved shell is developed, and the perfect adult form gradually assumed. The food consists of small animals swept to the mouth by the curled waving legs. Growth is somewhat rapid, but the

skin-casting of the adult is, except in one genus, much restricted. Neither the valves nor the uniting membrane, nor that forming the stalk, are moulted, but the surface gradually disintegrates and is removed, perhaps sometimes in flakes,

Fig. 3 — Attached Pupa of *Lepas australis* (after Darwin):

The cement-duct, *b*, is seen running to antennae, *a*.

Fig. 4.—Structure of *Lepas*, after removing right shell and integument (after Darwin).

a, cement-gland and duct; *b*, liver; *c*, testes; *d*, vas deferens; *e*, ovary; *f*, oviduct; *g*, thoracic legs; *h*, carina; *i*, tergum; *k*, 'scutum'; *l*, cirrus or penis; *m*, muscle

whilst new and larger layers are formed beneath. The commonest species, *Lepas anatifera*, is sometimes 16 inches in length, but most of this goes to the stalk.

The stalked Cirripedia have a world-wide distribution, especially, however, in the warmer seas. Nearly half of the Lepadidae are attached to floating objects, and are therefore peculiarly cosmopolitan. Some species are able to bore (*Lithothrya*), and more than one form has been found on shark, turtle, or whale. The stalked cirripedes are much more ancient than the sessile Balanidae, their golden age dating back to the cretaceous period. The history of knowledge in regard to the barnacle is a striking illustration of progress. While the early naturalists, such as Gerard (1597), abandoned themselves to the citation of popular myths, according to which the barnacle was the young form of a goose (see BARNACLE GOOSE), the animal became at a later date the object of serious but not exhaustive study, and was referred to the Mollusca, or regarded as intermediate between them and Crustacea; while within comparatively recent times the discovery of the life-history has made the position of these interesting forms entirely intelligible, and the monograph of Darwin has furnished an approximately complete diagnosis of all the forms known in 1857. Subsequent research has only been an amplification and corroboration of his classic work. Apart from their occurrence on ships, floating timber, &c., the stalked cirripedes have little practical interest, except that a few forms (*Pollicipes*) are, like some of the acorn-shells, big and dainty enough to be eaten. See ACORN-SHELLS, CIRRIPIEDIA; Darwin's Ray Society Monographs; and Max Muller's *Science of Language* (2d series), for the myth of the barnacle goose.

Barnacle (or BERNICLE) **Goose** (*Anser bernicla* or *Bernicla leucopsis*), the bird which the natural history of former days gravely represented as deriving its origin from a crustacean—the barnacle. In the middle ages, during what has been well called the period of mythical zoology, the enigmatical structure of the barnacle (*Lepas anatifera*), known in Germany as the 'duck-mussel'

(*Enten-muschel*), somehow led it to be regarded as the young stage of the barnacle goose. The bird is in size smaller than the common wild goose,

Barnacle Goose.

being a little more than 2 feet long, and about 5 lb. in weight. The bill is somewhat longer than the head, the wings long and pointed, the tail short and rounded, the black and white plumage very prettily marked. It is a common winter visitant of the western coasts of Britain and of Ireland, and retires in spring to its home in more northern regions, where it breeds, vast numbers passing northward along the coast of Norway to the Arctic Ocean. It is highly esteemed for the table.

The Brent Goose, or Brent Barnacle (*Anser* or *Bernicla brenta* of some naturalists), has frequently received the name of barnacle goose, and no little confusion has thus arisen. It is a smaller bird with much darker plumage, remarkable for length of wing and powerful flight, and for its distant migrations. It is at home in high northern latitudes, but occurs as a common winter bird-of-passage in the United States and Canada, as also in Britain and on the continent of Europe. It is excellent for the table.

Very nearly allied to these species is the Red-breasted Goose, or Red-breasted Barnacle (*Anser ruficollis*), a beautiful bird, of which the neck and upper part of the breast are of a rich chestnut red. In size, it resembles the brent goose. It is a very rare visitant of Britain and of the continent of Europe, and is abundant only in the extreme north of Asia.—Another species called Hutchins' Goose or Barnacle (*A. hutchinsii*), of dark plumage, and with a triangular patch of white on each side of the head and neck, is abundant in Hudson Bay and the extreme north of America. The limits of the genera *Anser* and *Bernicla* are rather dubious. See GOOSE.

Barnard, HENRY, an American educationist, born in 1811 at Hartford in Connecticut, studied at Yale College, travelled in Europe, and became in succession school commissioner of Rhode Island, of the Normal School in Hartford, president of St John's College at Annapolis in Maryland, and, in 1867, commissioner of education at Washington. By his *American Journal of Education*, he did much to promote the best interests of his country by guiding the public mind on educational questions. His works on his chosen subject are numerous and important; among them are *Pestalozzi and Pestalozzism* (1861), and *Education* (1879). He died 5th July 1900.

Barnard, LADY ANNE, author of 'Auld Robin Gray,' was born in 1750, eldest daughter of James Lindsay, fifth Earl of Balcarres. In 1793 she married Andrew Barnard, a son of the Bishop of

Limerick, and colonial secretary to Lord Macartney at the Cape of Good Hope. There Lady Anne lived till 1807, when, losing her husband, she returned to London, her residence till her death on 6th May 1825. Her matchless lyric, named after the old Balcarres herd, was written as early as 1772 to sing to an ancient melody; but she first acknowledged its authorship in 1823 to Sir Walter Scott. A number of her letters from South Africa were published in 1901 as *South Africa a Century Ago*. See the Earl of Crawford's *Lives of the Lindsays* (1849).

Barnard Castle, a market-town in the county of Durham, on the left bank of the Tees, 15 miles W. of Darlington by rail. On a rocky height over the river are the ruins of a castle built in 1112-32 by Barnard Baliol (q.v.), ancestor of John Baliol, king of Scotland, who was born in the castle, and founded an almshouse in the town. Barnard Castle is the scene of part of Scott's *Rokeby*. Near it is an art museum, French Renaissance in style, presented to the town in 1874 by the Countess Montalbo, in which are many of the art treasures formerly in Streatlam Castle. Pop. 5000.

Barnardo, THOMAS JOHN, founder of the homes for waifs, was born in Ireland in 1845, and qualified as a doctor in the hospitals of London, Edinburgh, and Paris. In 1866 he was moved to pity homeless boys in London, and presently began to rescue children who had found their only shelter at night under archways, or in courts and alleys. These were introduced to his homes, where they received an industrial training, were saved from a possible career of crime, and enabled to achieve an honourable position in life. At his death (19th September 1905) 60,000 boys and girls had passed through the homes. Dr Barnardo had under his direction over 50 separate institutions in the United Kingdom and the Colonies, including an immigration depot in Ontario, an industrial farm in Manitoba, a home for babies, and a hospital for sick children. Under his successor, William Baker (1849-1920), 30,000 more were admitted.

Barnaul, a town of Western Siberia, in the government of Tomsk, 290 miles SSW. of Tomsk. Situated on the Obi, it is the centre of mining industries in Western Siberia, has large smelting-furnaces, a school of mines, and a population of 47,000.

Barnave, ANTOINE-PIERRE-JOSEPH-MARIE, a notable figure in the French Revolution, born at Grenoble, October 22, 1761. He early attracted attention as an eloquent pleader in the parliament of Grenoble, and was sent as the deputy of his province to the States-general in 1789. Here his trenchant logic, keen wit, and vehement eloquence on behalf of public liberty quickly brought him to the front. He opposed the absolute veto, carried through the confiscation of church-property to the use of the nation, the emancipation of the Jews, and the abolition of the religious orders, and was mainly instrumental in the liberation of the slaves and reorganisation of the colonies. He became the idol of the people, particularly after his victory over Mirabeau, in the question of the power of peace and war, which Mirabeau wished to remain with the king, and Barnave successfully claimed for the National Assembly. After the flight to Varennes, he was deputed to conduct the royal family back to Paris, and this duty he discharged with a fine courtesy to the unhappy queen. Subsequently he advocated more moderate courses, defended the inviolability of the king's person, and resisted the assertion by the assembly of its power to remove ministers. This led to his being regarded as a renegade from the national

party, and to his being assailed by the fierce vituperations of the journalists. He retired to his native place on the dissolution of the National Assembly; but after the 10th of August 1792, he was impeached for treasonable correspondence with the court, tried, and guillotined 29th November 1793. See Life by E. D. Bradby (1915).

Barnby, SIR JOSEPH, musician, was born at York, 12th August 1838, and after studying at the Royal Academy of Music, held posts as organist, conductor, &c., at St James's Hall, Albert Hall (Royal Choral), Eton, and the Guildhall School. He composed motets, cantatas, an oratorio, anthems, part songs, hymn-tunes, &c. Knighted in 1892, he died 28th January 1896.

Barnes, ALBERT, an American theologian and celebrated biblical expositor, was born at Rome, state of New York, on 1st December 1798. He had thoughts at first of devoting himself to the study of law, but eventually prepared for the ministry at Princeton theological seminary. He had charge of a church in New Jersey, and was minister of the First Presbyterian church of Philadelphia, from 1830 to 1867, when he resigned on account of failing eyesight. He was a thoughtful and eloquent preacher. At one time he was tried for heresy, the charge being based mainly on some passages in his notes to Romans, but he was acquitted. He afterwards attached himself to the New School branch of the Presbyterians, and was a strong opponent of slavery. He is best known by his *Notes* on various parts of the Old and New Testaments, specially adapted for the use of Sunday schools and Bible classes, which have had an extraordinary circulation. These *Notes* are distinguished less by original critical power, than for their plainness, simplicity, and directness. He died at Philadelphia, 24th December 1870; a short time previously he had completed a new edition of his *Notes* on the New Testament (6 vols. 1871-72). He issued besides many volumes of sermons, an introduction to Butler's *Analogy*, *Evidences of Christianity*, and some Sunday-school manuals.

Barnes, WILLIAM, perhaps the first of English purely pastoral poets, was born in the vale of Blackmoor, of an old Dorsetshire stock that had once owned land, February 22, 1800. Spite of early difficulties, he acquired remarkable learning, and after some time in a solicitor's office, taught a school at Dorchester with success. After obtaining a Cambridge degree and receiving ordination, he took the curacy of Whitcombe in 1847, from which he passed to the rectory of Winterbourne Came in 1862. Meantime he had been making himself widely known by his fine idyllic poetry in the Dorsetshire dialect, 'the bold and broad Doric of England.' His first volume appeared in 1844; the second, the well-known *Hwomey Rhymes*, in 1859; the third in 1862; the three were collected together in 1879, and published as *Poems of Rural Life in the Dorset Dialect*. These poems reveal straightforward simplicity and sincerity of style, with rare imaginative insight into the simple joys and sorrows of country life. But his sympathetic affection for the human life that 'clothes the soil' is paralleled by his patience in observing the quiet life of nature, and his power of reproducing artistically for others the impression it makes upon the mind. The sweet air of southern England blows through every stanza he writes, and has had a charm of quite singular influence on thousands who have seen Dorsetshire but with the inward eye. His verses are none the less completely artistic that the art is all unconscious, and none the less completely beautiful that the representation of man and nature in them is within its limits completely true. His world was the secluded vale of Blackmore; and its humble

folk, with all their quaintness and humour, he has photographed with absolute truth, though with the instinct of the artist he has chosen as subject of poetic treatment only such episodes as are in themselves beautiful. There was nothing of Crabbe in his poetical equipment, and it need not be objected to a particular poet that he had eyes only for the pathos and beauty of country life, none for its squalor and misery. 'His verse is sometimes deficient in lyrical *swing*, as is apt to be the case when descriptive poetry is written in the dancing measures, which are too entirely emotional for work so calm and contemplative as the nature poetry of the English country.' Barnes made himself well known also by his chivalrous attempt to preserve the purity of the mother-tongue. His *Outline of English Speech-craft* (1878) is an attempt to teach the English language in purely English words. His tenses are 'time-takings,' adjectives are 'mark-words of suchness,' degrees of comparison are 'pitchmarks,' and sentences like 'these pitchmarks offmark sundry things by their sundry suchnesses' make large demands upon the reader's ingenuity. He wrote several works of value on philological subjects. He died 7th October 1886. See the *Life* by his daughter, Mrs Baxter ('Leader Scott,' 1887).

Barnes, an urban district of Surrey, in the parliamentary borough of Richmond; pop. 34,000.

Barnet, a town in the south of Hertfordshire, mostly on a hill-top, 11 miles to the NW. of London; population, 12,000. Formerly a place of importance on the great northern coach-road, it has still large cattle-fairs. Here in 1471 was fought the famous battle of Barnet, between the Yorkists and Lancastrians, in which, after a desperate struggle, the latter were routed, and their leader, Warwick, 'the king-maker,' killed, by which event Edward IV. was firmly established on the throne. An obelisk (1740) marks the spot.

Barnett, JOHN, composer, who was born at Bedford, 15th July 1802, died 17th April 1890, was for some time musical director of the Olympic Theatre, and is known as the composer of *The Mountain Sylph* (1834), *Fair Rosamond*, *Farinelli*, and other operas, besides vaudivilles and songs.—His nephew, JOHN FRANCIS BARNETT (1837-1916), studied at the Royal Academy of Music, and at Leipzig. His works comprise *The Ancient Mariner*, a cantata (1867), *Paradise and the Peri* (1870), *The Raising of Lazarus* (1870), *The Lay of the Last Minstrel* (1871), *The Good Shepherd* (1876), *The Building of the Ship* (1880), and *The Harvest Festival* (1881).

Barneveldt, JAN VAN OLDEN, Grand Pensionary of Holland, who played a great part in the long struggle with Spain, was born at Amersfoort in Utrecht in 1547, and in 1569 commenced practice at the Hague as an advocate. He early showed great ardour in the cause of the independence of his country; and as advocate-general of the province of Holland (1585), he proved equally his insight into affairs and his address in diplomatic management. Through Barneveldt's influence Prince Maurice succeeded his murdered father as stadtholder; but Barneveldt it also was, who, becoming head of the republican party, opposed the warlike tendencies of Maurice, concluded (1609) a truce with Spain, and prevented the States-general from joining the revolt of the Bohemians. His influence excited the House of Nassau to still greater jealousy, which in the religious controversies between the Remonstrants and Gomarists degenerated into the bitterest hostility (see ARMINIUS). To obviate a civil war, Barneveldt proposed an ecclesiastical assembly, which resulted in agreeing to a general toleration in respect of the disputed points. The States at

first concurred in this wise measure; but the intrigues of the Orange party brought about a change of views, by representing the Remonstrants as secret friends of Spain. Barneveldt, who sympathised with the more tolerant principles of that party, was attacked in scurrilous publications, and was insulted even in the meeting of the States by the mob, with whom Maurice was an idol. The strife between the Remonstrants and Gomarists became hotter every day, and threatened to end in civil war. In 1618 Barneveldt was illegally arrested, along with Grotius and Hoogerbeets, and thrown into prison. In the following November Maurice procured the summoning of the Synod of Dort, which condemned the Remonstrants with the utmost rigour and injustice. In March 1619, while the Synod was still sitting, Barneveldt was brought to trial before a special commission of twenty-four judges, who condemned as a traitor the innocent man to whom his country owed its political existence. It was in vain that his friends and relations raised their voice; Maurice was not to be moved. On May 13, 1619, the venerable man of 71 years of age mounted the scaffold, and laid down his head with the same firmness that he had shown through all the events of his life. His two sons were at the same time dismissed from office. Four years after their father's death they took part in a conspiracy against the life of the prince, which, however, was discovered. The elder escaped to Antwerp, the younger was seized and beheaded. See Motley's *Life of Barneveldt* (2 vols. 1874).

Barnfield, RICHARD, born at Norbury, Shropshire, in 1574, was educated at Brasenose College, Oxford, and died, a country gentleman, at Stone, in Staffordshire, in 1627. His three little volumes of pastoral poetry, quaint, rhythmic, dainty, but over-luxuriant, cloying with too much sweetness, appeared in 1594, 1595, and 1598. The last contained the ode, 'As it fell upon a day,' and the sonnet, 'If Musique and sweet Poetrie agree,' which, printed by Jaggard in the *Passionate Pilgrim* (1599), were long attributed to Shakespeare. There are complete editions of his poems by Grosart (1876) and Arber (1882).

Barnsley, a county borough in the West Riding of Yorkshire, on the river Dearne, 10 miles S. of Wakefield, and 15 N. of Sheffield by rail. Standing high, in the midst of a rich mineral district, it has manufactures of linen, iron, steel, and glass, bleaching and dye works, &c. Besides ample railway communication, it has the advantage of a canal. The county court was built in 1861; and in the same year a pretty public park of 20 acres was given to the town. Barnsley became a municipal borough in 1869, a parliamentary (with Darton, &c.) in 1918. Pop. 54,000.

Barnstable, a port of entry, with coasting and fishing trade, in Massachusetts, U.S., situated on the south side of Barnstable Bay, 65 miles SE. of Boston. Pop. 5000.

Barnstaple, a town of Devonshire, on the right bank of the tidal Taw, 6 miles from its mouth, and 39½ NW. of Exeter by rail. The Taw is here crossed by a 13th-century bridge of 16 arches, which in 1834 was widened by iron-work on either side. Owing to the silting up of the river and harbour, much of the trade of Barnstaple has been transferred to Bideford. It has manufactures of lace and pottery. Barnstaple has existed since the reign of Athelstan, who built a castle here. The poet Gay was educated at the grammar-school, a pre-Reformation chapel. The parish church is of 14th-century date; and there are a town-hall (1855), an Albert memorial tower (1863), &c. Till 1885 Barnstaple returned two members to parliament. Pop. 14,500.

Barnum, PHINEAS TAYLOR, American showman, was born at Bethel, Connecticut, July 5, 1810. His father was tailor, farmer, and tavern-keeper in turn. At thirteen young Barnum was employed in a country store; and about five years afterwards, went largely into the lottery business. When only nineteen, he married clandestinely, and then moved to Danbury, where he edited *The Herald of Freedom*, and was imprisoned 60 days for a libel. In 1834 he removed to New York, where hearing of Joice Heth, the reputed nurse of General Washington, he bought her for 1000 dollars, and with the aid of wholesale advertising, exhibited her to considerable profit. He continued in the show business from 1836 to 1839, but reduced again to poverty, he sold Bibles, exhibited negro dancers, and wrote for newspapers, until in 1841 he bought Souders's American Museum in New York, which he raised at once to prosperity by exhibiting a Japanese mermaid, made of a fish and monkey, a white negress, a woolly horse, and finally, a noted dwarf (Charles S. Stratton, of Bridgeport), styled General Tom Thumb, whom he exhibited in Europe in 1844. In 1847 he offered Jenny Lind 1000 dollars a night for 150 nights, and received 700,000 dollars—the concert tickets being sold at auction, in one case as high as 650 dollars for a single ticket. He built a villa at Bridgeport, in imitation of the Brighton Pavilion, and engaged in various speculations, one of which—a clock-factory—made him bankrupt. Settling with his creditors in 1857, he engaged anew in his career of audacious enterprises, and made another fortune. In 1866 he stood as a candidate for a seat in congress, but was unsuccessful. His *Autobiography* (1854, since greatly enlarged) has the merit at least of frankness. In 1865 he published *The Humbugs of the World*; in 1869, *Struggles and Triumphs*; and in 1883, *Money-getting*. In 1868 he relinquished the business of showman, resuming it, however, in 1871, when he organised a museum, menagerie, circus, &c., which required 500 men and horses to transport it through the country. For his hippodrome in New York he purchased for £33,000 from Messrs Sanger, London, in 1874, a duplicate of the whole plant for the pageant 'Congress of Monarchs.' His 'Greatest Show on Earth' required 100 railway cars for its conveyance. In 1879 he estimated the number of his patrons up to date as 90,000,000. In 1882 a day's receipts for his Great Show in Boston amounted to over £3000. The elephant 'Jumbo,' purchased in 1882 from the London Zoo, for £2000, was killed in 1885; and in 1887 Barnum's menagerie was destroyed by fire. In 1889 his show appeared at the Olympia in London. He died 7th April 1891, worth \$5,000,000.

Baroche, PIERRE-JULES, a French politician, born at Paris, November 18, 1802. He was elected in 1847 to the Chamber of Deputies, and was made Procureur-général. In March 1850 he became Minister of the Interior, and a decided Bonapartist. He was appointed Minister of Foreign Affairs in 1860, and Minister of Justice and Public Worship in 1863. He died October 29, 1870.

Baro'da, the second city of Guzerat, capital of the territory of the Gáekwár (Guicowar), in the state of the same name, 248 miles N. of Bombay. It stands to the east of the Viswamitri, which is crossed by four stone bridges, one of which is of singular construction—an upper range of arches resting on a lower one. It has several palaces, Hindu and other temples, and the chief court of the state. Most of the houses are mean and overcrowded. Baroda occupies an important position between the coast and the interior, and the trade is considerable. Pop. 100,000.—The Mahratta state of Baroda, the political control of which in 1875

was transferred from Bombay to the government of India, includes the territories of the Gáekwár in various parts of Guzerat. Area, 8200 sq. m. (larger than Wales). The northern districts, which form a wide plain, are drained by the Nerbudda, Tapti, Mahi, and other rivers. The soil is fertile; ruined temples, deserted towns, and tanks half filled with mud, are a witness of former prosperity. There is a famous breed of large white cattle; grain, cotton, opium, tobacco, sugar-cane, and oil-seeds are the chief agricultural products, and grow luxuriantly. The Gáekwár, Malhar Rao, installed in 1871, was deposed by the British government for obvious misrule (1873-75) and a suspected attempt to poison the British resident; and another member of the Baroda family was, in 1881, appointed in his stead. Pop. 2,000,000—five-sixths Hindus.

Baroja, Pío, Spanish novelist, born in 1872, a Basque with some Lombard blood, is by his own declaration an enemy of the past, 'antihistorical, antirhetorical, antitraditionalist.' His novels, dealing with affairs of the moment in Spanish life, are vividly impressionistic and somewhat formlessly picaresque. In the mediæval *Legenda de Jauri de Alzate* (1922) his mind has taken a new direction.

Barometer, an instrument for measuring the weight or pressure of the atmosphere, invented in 1643 by Torricelli (q.v.). The term is generally understood to refer to one in which the measure is the height of a column of liquid sustained by atmospheric pressure. The fundamental principle of the construction of the barometer is best shown in the experiment which led Torricelli to the discovery of the pressure of the air. A glass tube, about 33 inches in length, open at one end, is completely filled with mercury, and, being firmly closed by the thumb, is inverted and placed vertically in a cup containing mercury. When the thumb is removed, the mercury sinks in the tube till it stands, generally, about 30 inches above the level of the mercury in the cup, leaving in the upper part a space free of air, which receives the name of the Torricellian vacuum (fig. 1). The mercury within the tube being thus removed from the pressure of the air, while that in the cup is exposed to it, the column falls, till the pressure at the section of the whole, in the same plane as the surface of the mercury in the cup, is the same within and without the tube. A similar experiment is seen when, in a U-shaped tube, having one branch much wider than the other, a column of mercury in the narrow branch balances a column of water nearly 14 times as high in the other. In the Torricellian experiment, we have the air and the space occupied by it taking the place of the wide water branch of the U-shaped tube, and the glass tube and mercury forming the narrow branch, as before; the narrow branch, however, in this case being closed above, to prevent the air from filling, as it were, both branches. In both cases, the heights of the columns are inversely as the specific gravities of the liquids of which they consist; and as air is about 10,000 times lighter than mercury, we should have the aerial column 10,000 times 30 inches high. It will be found, under ATMOSPHERE, that from the air lessening in density as it ascends, the height is considerably greater. Any changes that take place in the density of the aerial column will be met by corresponding changes in the height of the mercurial column, so that as the latter rises or falls, the former increases or diminishes. We have, then, in this simple tube, an infallible index of the varying amount of atmospheric pressure, and, in fact, a perfect barometer. The changes, however, are indicated on a scale at least 10,000 times diminished, so that the variations in the tube show very considerable changes in the weight

of the atmosphere. If water be used instead of mercury, the water column would be 14, or, more correctly, 13.6 times as high as the mercurial column, or about 34 feet; and the scale on which the changes take place would be correspondingly magnified, so that a water barometer should be much more delicate than a mercurial one. Water is, however, exposed to this serious objection, that its vapour rises into the empty space above, and causes by its elasticity a depression of the column, the depressions being different for different temperatures. At zero, Fahrenheit, for instance, the depression thus arising would be half an inch, and at 77°, more than 1 foot. It would be doubtful, likewise, at the time of any observation, whether the space referred to was filled with vapour of the elasticity corresponding to the observed external temperature or not, so that the necessary correction could not with certainty be made. The vapour of mercury, on the other hand, at 77° F.—a temperature considerably above the average—produces in the barometer a depression of only $\frac{1}{115}$ of an inch, an amount practically inappreciable. After 200 years of experience and invention, we have yet no better index of the pressure of the atmosphere than the simple mercurial column of Torricelli, and in all exact observations it is, in one modification or another, taken as the only reliable standard.

Simple as the barometer is, its construction demands considerable care and experience. It is of the first importance that the mercury to be used is chemically pure, otherwise its specific gravity and fluidity are impaired, and the inside of the tube becomes coated with impurities in such a way as to render correct observation impossible. Mercury as usually sold, is not pure; and before being employed for barometers, must be shaken well with highly dilute but pure nitric acid, to remove extraneous metals and oxides. The same object is effected more thoroughly by keeping it several weeks in contact with the dilute acid, stirring every now and then. After either process, the metal must be thoroughly washed with distilled water, and dried. In filling the tube, it is essentially necessary to get the column free from air and moisture. To effect this, the mercury, after filling, is boiled in the tube, so that air and moisture may be expelled, partly by the heat, and partly by the vapour of the mercury. This process demands great experience and skill, but the same end may be more easily and as effectually attained by boiling the mercury, in the first instance, in an atmosphere of carbonic acid, and then pouring it into the previously heated tube by a filler reaching to the bottom of it. Such care is only expended on the best instruments; ordinary weather-glasses, not needing to be quite accurate, are more simply filled. Notwithstanding all these precautions, minute bubbles of air may manage to keep secreted, and creep up in the course of time into the Torricellian vacuum. To obviate this risk of error, an air-trap is recommended by which any air that may accidentally find its way into the tube, or may be left in it, is arrested in its ascent to the top, and any damage to the instrument averted.

Barometers are usually divided into two classes—cistern barometers, and siphon barometers. The simplest form of the cistern barometer is that shown in fig. 1, which only requires to be set properly in a frame, and provided with a scale, to make it complete. Fig. 2 presents another form of that class, being that generally seen in weather-glasses or ordinary barometers. The tube is bent at the bottom, and the cistern is merely an expansion of the lower end. Very generally, the cistern is hidden from view, and protected from

injury by a wooden cover in front. There are two causes of inaccuracy in cistern barometers—one being the capillarity, which tends to lower the

Figs. 1,

2,

3,

4,

5.

column; and the other being the difference of level in the cistern caused by the fluctuations in the tube, which renders the readings on the fixed scale at one time too great, and at another too small, according as this level rises above or falls below the original level, or zero-point, from which the scale is measured. The effect of capillarity may be avoided by using tubes of more than half an inch in bore, in which the depression becomes so small that it may be left out of account. In smaller tubes it is estimated from tables constructed for the purpose. Wide tubes have the additional advantage, that atmospheric changes are seen earlier in them than in narrow tubes, there being less friction in the wider than in the narrow. With reference to the error of level, it must be borne in mind that the height of the column sustained by the atmosphere is always to be reckoned from the surface level of the mercury in the cistern. The larger the capacity of the cistern compared with that of the tube, the less becomes this error; for then a very considerable rise or fall in the tube, when spread over the surface of the cistern, makes only a slight difference of level. Care should then be taken to make the cistern as large as possible. The barometer in which the error of level is completely obviated, is that invented by Fortin, which, from its being in every respect the most perfect cistern barometer, deserves particular notice. The cistern, and the lower portion of the tube of this barometer, are shown in fig. 6. The cistern is made of boxwood, with a movable leather bottom, *bb*, and a glass cylinder is inserted into it above, all except the glass being encased in brass. In the bottom of the brass box a screw works, on the upper end of which the leather rests, so that by the sending in or taking out the screw, the bottom of the cistern, and with it the cistern level of the mercury, can be raised or depressed at will. A small ivory pin, *p*, ending in a fine point, is fixed to the upper frame of the cistern; and when an observation is made, the surface of the mercury is made to coincide with the point of the pin as the standard level or zero-point from which the barometric column is to be measured. The tube of the barometer—the upper part of which is shown in fig. 3—is inclosed in one of brass, which has two directly opposite slits in it for showing the height of the column, and on the sides of these the graduation is marked. A

brass collar, *cc*, slides upon the tube with a Vernier (*q.v.*), *vv*, marked on it for reading the height with great exactness, and in which two oblong openings are cut, a little wider than the slits in the

Figs. 6,

7,

8.

brass tube. When a reading is taken, the collar is so placed that the last streak of light is cut off by the two upper edges of the openings, or until they form a tangent to the convex mercurial curve. By this means, the observer is sure that his eye is on a level with the top of the column, and that the reading is taken exactly for this point. This is the contrivance usually adopted to prevent the error of parallax, or that caused by the eye being slightly above or below the top of the column, by which the scale and the top of the column are projected too high or too low, the one upon the other, as the case may be. The only other arrangement worthy of mention for effecting the same object is that by Weber, who etches the scale on a piece of silvered glass placed over one side of the tube; and when—the mirror and tube being vertical—the image of the eye appears along with the vertex of the column, the eye is in the same horizontal line with it. Fortin's barometer is generally arranged so as to be portable, in which case the screw, *s*, is sent in until the mercury fills very nearly the whole cistern, by which the air is kept from entering the tube during transport, the leather yielding sufficiently at the same time to allow for expansion from increase of temperature. It packs in a case, which serves as a tripod when the instrument is mounted for use. On this tripod it is suspended about the middle, swinging upon two axes at right angles to each other, so that the cistern may act the part of a plummet in keeping the tube vertical—the position essential to all correct measurements.

The siphon barometer consists of a tube bent in the form of a siphon, having the same diameter at the lower as at the upper end. Fig. 7 represents a simple form of it. The tube travels along the board on which it is placed by passing easily through fixed rings or collars of brass. A scale, divided in inches and parts of an inch, is fixed on the upper part of the board; and when an observation is taken, the tube is adjusted by the screw, *s*, working below it, so that the top of the lower mercurial column

may be on a level with the fixed mark, *a*, or the point from which the fixed scale is measured. In the best forms of the siphon barometer, both tube and scale are fixed, the latter being graduated upwards and downwards from a zero-point near the middle of the tube, and the height of the column is ascertained by adding the distances from it of the upper and lower levels. The siphon barometer is in some respects preferable to the cistern barometer. In the first place, the bore at the upper and lower ends of the tube being the same, the depression arising from capillarity is alike for both, and the error from this cause disappears in taking the difference of the heights. In the second place, since the final reading is got from a reference to both upper and lower surfaces, the error in the cistern barometer produced by the different capacities of the tube and cistern is effectually avoided. Gay-Lussac's siphon barometer (fig. 4) is bent near the bottom, so as to allow of the lower branch being placed in the same straight line as the upper one. When constructed for transport, the tube at the bend is narrowed, as in the figure, to a capillary width, which effectually excludes the air; and when the tube is inverted (fig. 5)—that being the position in which it is carried—the mercury is nearly all held in the longer branch. The wheel barometer, originally invented by Hook, and generally seen as a hall or parlour ornament, has nothing to recommend it as a trustworthy instrument. Fig. 8 shows the main features of its construction. See ANEROID.

Until recently barometric readings in Great Britain and other countries not employing the metric system were expressed in inches of mercury. Since 1st May 1914, however, the barometric pressures given in the 'Daily Weather Report' of the Meteorological Office are quoted in a new term, viz. millibars. The millibar is derived from the centimetre-gramme-second system of units employed generally in physics, the absolute unit of pressure on this system being the dyne per square centimetre. As this unit is exceedingly small, a practical unit one million times as great has been suggested. This unit, the megadyne per square centimetre, is called a 'bar.' On this system the value of the standard atmosphere or mean sea-level pressure, the equivalent of which is 29·92 mercury inches, is 101·32 centibars or 1013·2 millibars. On the ordinary dial barometer the word 'change' is placed opposite the reading of 29·5 inches. On the new system the reading 1000 would be substituted for the above value. It is hoped that the new system will soon be universally employed, and meteorology thus brought into line with other branches of physics, the units of which are the same in all countries.

The correction of the barometer for temperature is essential. Mercury expands $\frac{1}{1000}$ of its bulk for every degree of Fahrenheit's thermometer; if, then, a barometer stands at a height of 30 inches when the temperature of the whole instrument is 32°, it will stand at 30 $\frac{1}{10}$ if its temperature be raised to 69°. This increase of the length of the column by the tenth of an inch is not due to any increased pressure, but solely to the expansion of the mercury under a higher temperature. In order, therefore, that all observations may be compared correctly with each other, the observed heights are reduced to what they would be, if the temperature of the whole instrument with its contained mercury was at 32°. The rule for reduction is very simple: Multiply the number of degrees above or below 32° F. by the observed height, divide the product by 9990, and subtract or add the quotient from or to the observed height for the reduced height. Tables for this purpose have been published by the Royal Society, from which the corrections are found at once.

The variations of the barometer are both periodical and irregular. Periodical variations are those taking place at stated and regular intervals, and irregular, such as have no regular period of recurrence. Perhaps the only truly periodical variation is the daily one, which varies from about 0.150 to 0.001 inch. In most regions of the globe there is also a well-marked annual variation, widely different for different regions. Accidental variations give a range of about $4\frac{1}{2}$ inches. The lowest hitherto observed is 27.333 inches, reduced to sea-level, or 925.5 millibars, at Ochertyre, Perthshire, on January 26, 1884 (see ATMOSPHERE); at Bannaul, in Siberia, a pressure of 31.630 inches (1077.1 millibars) was recorded on December 16, 1877, where the temperature on that day fell to $-54^{\circ}4'$.

The uses of the barometer may be classified into physical, hypsometrical, and meteorological. It is of essential use in all physical researches where the mechanical, optical, acoustical, and chemical properties of air or other gases are dependent on the pressure of the atmosphere. Its use in hypsometry, or the art of measuring the heights of mountains, is very valuable. When a barometer is at the foot of a mountain, the pressure it sustains is greater than that which is at the top by the weight of the column of air intervening between the top and bottom. A formula of considerable complexity is given by mathematicians for finding approximately the true height of a mountain from barometrical and thermometrical observations made at its base and summit, the interpretation of which does not come within the compass of this work. The following rules give very nearly the same result: (1) Reduce the mercurial heights at both stations to 32° F. (2) Take the logarithms of the corrected heights, subtract them, and multiply the result by 10,000, to give the approximate height in fathoms of the upper above the lower station. (3) Take the mean of the temperature at both stations, take the difference between this mean and 32, multiply the difference by the approximate height, and divide the product by 435. This last result is to be added to the approximate height, if the mean temperature is above 32, and subtracted, if below, to find the true height in fathoms.

The best known use of the barometer is as a meteorological instrument or as a weather-glass. Opticians sometimes attach to certain heights of the barometer particular states of weather, and at certain points of the scale the words 'Rain,' 'Changeable,' 'Fair,' &c., are marked; but the connection thus instituted is very misleading. All who would examine carefully the connection of barometric heights with changes of the weather, must discard entirely the use of these terms, seeing that it is not the actual height of the barometer at any place, but this height as compared with that of immediately surrounding regions, which indicates the weather and the strength of wind accompanying it. Several elaborate codes of rules have been drawn up to serve as a key to the variations, but as these are more or less of a local and hypothetical character, they would be here out of place. Generally speaking, a falling barometer indicates rain; a rising barometer, fair weather. A steady barometer foretells a continuance of the weather at the time; when low, this is generally broken or bad, and when high, fair. A sudden fall usually precedes a storm, and the violence of the wind is in proportion to the barometric gradient. An unsteady barometer indicates unsettled weather; gradual changes, the approach of some permanent condition of it. The variations must also be interpreted with reference to the prevailing winds, each different wind having some peculiar rules. The connection between changes of weather and the pressure of the atmo-

sphere is by no means well understood. One or two points may, however, be stated. Since, as has been shown by Dalton, moist air is lighter than dry air, the barometric column will read relatively low wherever a large amount of aqueous vapour has displaced a part of the drier air. The south and south-west winds, which are, in Western Europe, more than any other, the rain-bringing winds, are warm and moist winds. Now, a column of such air, to be of the same weight as one of cold dry air, must be higher; but this cannot occur in the atmosphere, for no sooner does the warm moist column, by its lightness, ascend to a height where the pressure of the surrounding air is less than its own, than it ceases to rise farther, and thence flows over as an upper current in the directions where pressure is less. It follows that pressure is relatively low over any region where for the time the air is moister and warmer than in adjoining regions. On the other hand, the northerly and easterly winds, being comparatively cold and dry, are accompanied with fair weather and a high barometer. The rain attendant on a low barometer, as well as the fine weather accompanying a high barometer, are in a considerable degree to be regarded as the necessary concomitants of our geographical position—of our having the land to the east, and the ocean, with its large evaporating surface, to the west of us. In Great Britain a high and rising barometer frequently accompanies east winds with a drenching drizzle. On the La Plata River, on the other hand, matters are often the reverse of what they are with us; for there the cold south-east wind, coming from the ocean, brings rain with a high barometer, and the land winds, heated by the plains of South America, maintain fine weather with a low barometer. That the temperature, as well as the moisture of the air, is an important cause of the changes of the barometer, is also shown by the fact that, in the tropics, where the variations of the temperature are slight compared with the temperate zones, the barometer shows almost no change; and also that the region of lowest mean barometer in Asia in summer is not the region of largest rainfall, but the region of highest temperature. See the standard works on Meteorology, such as the books by Archibald, Buchan, Davis, Dickson, Moore, and Waldo.

Bar'ometz, or Tartarian or Scythian Lamb, the prostrate stem of a fern (*Aspidium barometz*) which grows in the salt-plains near the Caspian Sea. It is shaggy with yellow silken down, from which the ancients are said to have woven costly garments. The hairy covering, and a rough resemblance to an animal, seem to have formed the basis of the extraordinary opinions which were current in Russia and elsewhere, as late as a century ago, in regard to this fern. It was believed to be at once plant and animal, to grow on a stalk, but yet to have head, eyes, ears, and limbs like a lamb, to eat grass, and in other marvellous ways to show forth 'the glory of the Creator to whom all things are possible' (Herberstein, 1563). The word is an erroneous form of the Russian *baranetz*, diminutive of *baran*, 'ram.' Erman (*Travels in Siberia*, vol. i. p. 111) supposes that these fables simply originated from embellished accounts of the cotton-plant. The red viscid juice is sometimes used as an astringent.

Baron, a term originally derived from late Lat. *baro*, 'a man,' acquired, like *homo*, under the feudal system, the meaning of a vassal, 'homage' (*hominium*) being the ceremony by which the vassal became the man of his lord. By the 13th century in England the highest class of the king's tenants-in-chief, all of whom were holders of several knight's fees, had come in a more restricted sense

to be called barons, the term sometimes including earls and spiritual lords, besides those who were barons and nothing more. Barons possessed a civil and criminal jurisdiction, and were liable, or entitled, to take part in the general council of the nation. The provisions of the Great Charter show that in the time of King John a distinction was recognised between two classes of barons; the right of the 'barones majores' being secured to a personal summons to parliament, along with the archbishops, bishops, abbots, and earls; while the other tenants-in-chief of the crown were summoned generally by the sheriff. This personal summons became the means of defining who were great barons; and in the course of time the right to it came to be regarded as hereditary, a quality thoroughly established in the reign of Edward I. The term baron came more and more to mean the holder of a seat in the House of Lords; the existence of territorial barons, who had no seat in parliament, passed out of mind; and the word baronage came to be regarded as an equivalent for the peerage generally, members of the higher orders of the peerage being all barons. Barons who were such in virtue of their summons were known as barons by writ; and their baronies were inherited by heirs male and female. When parted between two or more co-heiresses, such a barony falls into abeyance, until one, or the sole heir of one of the co-heiresses only survives. It is held that the crown can at any time terminate the abeyance in favour of one of the co-heirs. The creation of barons by patent, first introduced in the reign of Richard II., made the dignity personal, the patent limiting the succession to it. John de Beauchamp of Holt, the first baron by patent, was created Baron of Kidderminster by letters-patent, dated 10th October 1387, to himself and the heirs-male of his body. It was not till the twenty-fourth year of Henry VI. that the practice of creating barons in this way became general; but the creation of barons by writ has now been long discontinued, except in the case of the eldest son of a peer of a higher grade, who is occasionally summoned to parliament in right of his father's barony.

In Scotland, as in England, the term baron at first included all crown vassals—but it came in the course of time to be applied in a more restricted way to such of them as had had their lands erected by the king in *liberam baroniam*. The whole barons, even in the wider sense of the word, were, theoretically at least, under the obligation to attend the council of the nation. By the less considerable landholders (even such as were in this stricter sense barons) this obligation was felt a grievous burden, and doubtless it was not very rigidly enforced. A statute of James I. in March 1427-28 enacted that the 'small barons' should be excused from attending parliament, provided they sent two or more wise men from each sheriffdom to represent them. Though this act was a failure in its main object, the introduction of parliamentary representation (which was not actually established till 1587), it seems to have afforded a quasi-sanction to the habitual absence from parliament of all but the largest landowners. The hereditary title of lord of parliament, first introduced in the 15th century, was in Scotland by no means correlative with the status of baron, it being but a small proportion of the holders of charters of barony who were invested with that dignity. About the end of the 16th century, lords of parliament began occasionally to be styled 'barones majores' in contradistinction to other holders of these lands by barony, who were 'barones minores'; and when, with the more intimate intercourse between the two countries, something like the English idea of peerage sprang up in Scotland, the position of the former was

accounted analogous to that of English barons; their proper designation, however, continuing to be lords, not barons, as distinctly recognised even after the Union of 1707 had put them in possession of all the privileges of peers of England, except the right to sit in parliament and on the trial of peers.

Down to the Restoration the English barons had no coronet, but wore crimson velvet caps turned up with ermine, and at an earlier date, scarlet caps turned up with white fur. Charles II. assigned to them for coronet a circlet of gold, having six large pearls set on it, of which four are seen in the cut, the cap being of crimson velvet guarded with ermine with a gold tassel. The mantle of state is scarlet, with two doublings of ermine. In 1665, when the coronets Baron's Coronet, of the peers of Scotland were assimilated to those of England, a royal warrant extended the use of this coronet to Scottish lords of parliament.

Scottish barons (not lords) had in virtue of their charters of barony very extensive rights of jurisdiction, civil and criminal, including 'pit and gallows,' power over life and limb: the gallows-hill is still an object of interest near some baronial mansions. That jurisdiction might be exercised either by the baron himself or by his bailie. Act 20 Geo. II., chap. 43, reduced the jurisdiction of a baron in civil matters to the right of recovering from vassals and tenants the feu-duties and rents of their lands, and of compelling them to perform the services to which they were bound; he could also entertain civil questions generally when the amount did not exceed 40s. His criminal jurisdiction was at the same time restricted to the power of inflicting a fine of 20s. for assaults. This limited jurisdiction soon fell into desuetude. The same statute further provided that no future charter of barony should confer any higher jurisdiction than the power to recover rents, multures, and will services. Some Scottish peers of higher title sit in the House of Lords as barons of the United Kingdom; thus the Duke of Argyll sits as Baron Sundridge.

The judges in the Court of Exchequer (q.v.) were from a very early period called Barons of Exchequer. The name probably meant no more than *men*, chief men, of exchequer. The parliamentary representatives of the Cinque Ports (q.v.), who sat in the House of Commons till 1831, were also called barons.

In Germany, the term baron originally meant, as it did elsewhere, a tenant-in-chief of the crown; but its signification, instead of becoming restricted, as in England, became extended. The greater barons, or dynasty-barons, who had seats in the estates of the realm, were all in the earlier part of the 18th century elevated to higher titles. Every descendant of the Knights of the Holy Roman Empire, who ranked among the lower nobility, took the style of baron; and a large number became barons in virtue of a diploma from some reigning prince, the title being used by all the descendants of the patentees.

In France, very few barons belonging to the old *noblesse* remain; most of the titles of baron now enjoyed, date from the First Empire or the Restoration. A very few were creations of Louis-Philippe. French barons bear, by way of augmentation, a sinister canton in their arms.

Baron and Femme, or **FEME**, are Norman. French words, used in English law to denote Husband and Wife (q.v.). See also MARRIAGE. The words are also used in Heraldry to designate the bearing by which the arms of husband and wife

are carried per pale, or marshalled side by side on the same shield (the husband's being on the dexter side).

Baronet, a hereditary title which, etymologically signifying a little baron, seems to have originated in a misapprehension of the derivation of the word *Banneret* (q.v.), sometimes called in Latin *baronetus*. This dignity was instituted by James I. in 1611, avowedly for the defence of the new plantation of Ulster, but really to replenish the king's exchequer, and was bestowed by letters-patent. The recipient of it was to be a gentleman of coat-armour for at least three descents, with a clear revenue of £1000 from lands. His patent specified his precedence as before all knights, including Knights of the Bath, and such bannerets as were not made in the field in presence of the king: the style was given him of Baronet, and the prefix 'Sir' before his name, while his wife was to have a precedence corresponding to his own, with the style of 'Lady,' 'Madame,' or 'Dame.' Each baronet came under an obligation to maintain thirty soldiers in Ireland for three years, at the rate of 8d. per day for each, the wages of a year being paid into exchequer on the passing of the patent. The sum thus exacted, with the fees of honour due to the officers, exceeded £1000 on each patent. It was stipulated that the number of baronets should not exceed 200, and that on the extinction of a baronetcy, no other should be created to fill up the vacancy. The original baronets were among the most considerable landed gentlemen in England, the first being Sir Nicholas Bacon of Redgrave, Suffolk, Knight, whose patent is dated 22d May 1611, and whose descendant is still the premier baronet. All the original patents were granted to the recipient and the heirs-male of his body. King James never exceeded the 200, except by five creations in room of five baronets who were elevated to the peerage; but his successors disregarded the restriction, and the number became unlimited. The qualifications regarding birth, estate, &c. have not been rigidly adhered to in later times, though it is still required that each baronet, before his patent be issued, shall be certified by the proper authorities to be a gentleman of coat-armour. In 1612 a dispute for precedence between baronets and the younger sons of viscounts and barons was decided by the king in favour of the latter; and it was at the same time directed that baronets might bear in their shield of arms, in a canton or inescutcheon, the arms of Ulster, argent, a sinister hand erect couped at the wrist gules—the 'bloody hand' (fig. 1). In the same year, the king knighted the heirs of the existing baronets, and ordained that the eldest sons of baronets might in future claim knighthood on attaining majority, a provision also set forth in the earlier patents, which, after falling into disuse, was recognised in three instances, in 1824, 1827, and 1835, but disallowed in the case of the eldest son of Sir James Broun, a Nova Scotia baronet, in 1836.

Fig. 1.

An order of baronets similar to that of England was instituted in Ireland in 1619, the arms of Ulster being also allowed them, and the money going to the Irish exchequer. The first baronet of Ireland was Sir Dominick Sarsfield, then Chief-justice of the Common Pleas in Ireland, whose patent was dated October 14, 1619.

The institution of the degree of baronet in Scotland, contemplated by James I., was carried out by his successor, the avowed object being to aid Sir William Alexander's scheme for the colonisation of Nova Scotia. The number was not to exceed

150; the sum payable was £3000, and the patents at first included grants of specified lands in that colony. As the lands conveyed and described had no actual existence, the grants were illusory; and the practice of including such grants in the patents continued down to 1638, though Nova Scotia had long before that date passed into the hands of the French. Baronets of Scotland are often called baronets of Nova Scotia; but the name can hardly be given with propriety to those created after 1638. The first creation was that of Sir Robert Gordon of Gordonstone, second son of Alexander, eleventh Earl of Sutherland, whose patent bore date 26th May 1625. The later creations of Charles I. included gentlemen unconnected with Scotland, and in one instance a lady, Dame Maria Bolles, of Osberton, Notts. In almost all patents by Charles I. the limitation was to heirs-male whomsoever; afterwards, though there was considerable variety, the most common limitation was to heirs-male of the body. It was at first provided that baronets of Scotland should charge their coat-armour with the arms, supporters, and crest of Nova Scotia on a canton or inescutcheon. In 1629 they became entitled to wear a personal decoration or badge pendent from an orange-tawny ribbon—viz. in an escutcheon argent, a saltire azure, thereon an inescutcheon of the arms of Scotland, an imperial crown above the escutcheon, and round the whole the motto, *Fax mentis honestæ gloria* (fig. 2). The wearing of this badge, having fallen into disuse after the Civil War, was revived at a meeting of the baronets of Scotland in 1775. In representations of the arms of a baronet of Scotland, it is usual to place this badge below the shield, hanging from an orange-tawny ribbon surrounding it.

Fig. 2.

No baronets of Scotland have been created since 1707, and of Ireland since 1801. Later baronets are of Great Britain or of the United Kingdom.

Baronets take rank immediately after the younger sons of barons; and they take precedence among themselves as follows: Baronets of England; of Scotland; of Great Britain; of Ireland; of the United Kingdom. The historic rights of a number of baronetcies have been called in question (notably by Dr J. H. Round). And a royal warrant of February 1910 commanded an official list of baronets to be prepared and kept at the Home Office, and revised in consultation with one of the kings of arms. Henceforth none shall be recognised as a baronet who is not in this list. Claims may, however, be submitted to one of the law officers of the crown and referred to the Privy-council.

Baronius, CÆSAR, church historian, born at Sora, in Naples, 30th August 1538, was one of the first pupils of St Philip Neri, and attached himself to his Congregation of the Oratory, of which he afterwards became superior (1593). He became famous by his *Annales Ecclesiastici a Christo nato ad annum 1198* (12 vols. 1588-93), a reply to the *Magdeburg Centuries* of the Protestant Flacius (q.v.), aiming to prove that the Church of Rome was identical in doctrine and constitution with the Christian Church of the 1st century. Honours were now showered upon his head. He became confessor to the Pope, apostolical protonotary, cardinal in 1596, librarian of the Vatican Library, and would have been elected pope on the death of Clement VIII. in 1605 but

for the opposition of the Spaniards, who were indignant at him for his treatise, *Tractatus de Monarchia Siciliæ* (in vol. xi. of his great history), in which he argued against Spain's claim to Sicily. He died June 30, 1607. The best complete edition of the *Annales* (not unaffected by polemical purpose) is that edited by Mansi (38 vols. Lucca, 1738-59), which contains Pagi's *Critica*. Odoricus Raynaldus wrote a continuation down to the year 1565 (9 vols. 1646-76). A new edition of the work, with the continuations of Raynaldus and others, is that of A. Theiner (37 vols., Bar le Duc, 1864-83), who himself wrote a continuation for the years 1572-85 (Rome, 3 vols. 1857). Amongst other works of Baronius, his publication of the *Martyrologium Romanum* deserves to be noticed (Rome, 1586, and often reprinted).

Baron of Beef, a large piece of beef, consisting of both sides of the back, or a double sirloin, and weighing, according to the size of the animal, from 50 to 100 lb. This monstrously large piece of beef, roasted, is served only on particular festive occasions at the English court, and at great public entertainments. When served according to ancient custom at civic feasts in Guildhall, London, the baron of beef is honoured with a distinguished place on a kind of elevated rostrum, where it is ceremoniously carved for the assembled guests. The derivation of the term is unknown.

Barons' War. See MONTFORT.

Barony is, or, it may rather be said, was a manorial and hereditary right arising out of land, known to the law both of England and Scotland. In England, manors were formerly called baronies. In the Scots law, a right of barony is a right in relation to lands which have been erected by a crown-charter making the grant *in liberam baroniam*. It involved a civil and criminal jurisdiction to which, in theory, all the inhabitants of the barony lands were amenable, but this was greatly reduced by the Heritable Jurisdictions Act passed after the Rebellion of 1745, and now exists only on the civil side for the purpose of recovering rents and duties, &c. The barons had also powers with reference to the trading privileges and municipal government of certain burghs, but trading privileges were abolished in 1847, and nearly all the older burghs have now adopted modern Police Acts (see BOROUGH). The barony grant placed the baron in an exceptionally favourable position for acquiring by prescriptive possession such rights as salmon-fishing, mussel scalps, submarine minerals, &c. Indeed, where the barony is stated to be bounded by the sea, the foreshore and the privilege of collecting seaware belong to the baron, apart from possession. See *The Picture of a Scottish Baron Court*, by Patrick Anderson (reprinted Edin. 1821). For the English Court Baron, see MANOR. In Ireland the barony is the largest subdivision of the county.

Baroque (Portuguese *barroco*, 'a rough, irregular pearl'), originally a mere jewellers' term, but soon extended in sense, and applied in art to ornamental designs of an extravagant or incongruous character. The style followed the Renaissance in Italy, and was much in vogue from the middle of the 16th to the end of the 18th century. Aiming at surprises and general oddness, baroque depends entirely on the fancy and caprice of the architect, and, by means of over-accentuation and distortion of all straight lines, produces an effect often bold and sometimes picturesque, but always opposed to the established rules of art. See ROCOCO; and Ricci, *Baroque Architecture and Sculpture in Italy* (1912).

Barosma. See BUCKU.

Barossa, a quite unjustifiable English spelling of Barrosa (q.v.).

Barotse, or MAROTSE, a Bechuan (Bantu) tribe, who early in the 19th century overran the country on both sides of the Upper Zambezi now known as Barotseland (proper), then occupied by Bantu tribes akin to those of the Upper Congo. By-and-by the Bechuan Barotse were driven from power by the Makololo, a Basuto people who migrated northwards under Sebituane; but the Barotse soon re-established their power, and practically exterminated the Makololo. The present inhabitants are known as Barotse, though strictly the name belongs only to an oligarchy. At King Lewanika's request the country came under British protection. The Barotse have a large measure of local autonomy, under the advice of a Rhodesian resident, and the whole of North-Western Rhodesia (182,000 sq. m.) is called Barotseland in the wider sense of the word. See RHODESIA.

Barque, or BARK, a general name frequently given to small ships, square-sterned, without head-rails; but specially applied to a three-masted vessel whose mizzen-mast is 'fore-and-aft' rigged instead of being, like the fore and main masts, square-rigged. A 'barquentine' (on the analogy of 'brigantine') differs from a barque in that its foremast alone is square-rigged. See SHIP, SAILS.

Barquisime'to, a town of Venezuela, on a fertile and healthy plain 1700 feet above sea-level, was founded in 1522, and destroyed in 1812 by earthquake; pop. 40,000.

Barra, a small island of Inverness-shire, near the southern extremity of the Outer Hebrides, 42 miles W. of Ardnamurchan Point. It is 8 miles long, and 2 to 5 broad, with deep inlets of the sea; its area is 25 sq. m. A low sandy isthmus, over which the sea nearly breaks at high-water, connects the two parts into which Barra is divided. The south or larger part contains a rocky mountain, 2000 feet high, and is divided into small valleys. Pop. 2300, Gaelic-speaking, largely Catholic, and among the most industrious of Scottish fishermen.

Barra, a pleasant suburban town about 3 miles E. of Naples, with a pop. of 10,000.

Barra, a petty Mandingo kingdom of Gambia (q.v.), near the mouth of the Gambia, with an estimated pop. of 200,000, the men being remarkable for their fine proportions. The surface, which is fertile, but rather marshy, is well cultivated. In Barra is the port of Albreda, from which considerable trade is carried on. The chief town is Baurinding, where the so-called king resides.

Barrackpur, a native town and military cantonment, Bengal, on the E. bank of the Hughli, and 15 miles up the stream from Calcutta. It is a favourite retreat for Europeans from Calcutta; and to the south is its park, containing the suburban residence, formerly of the Viceroy of India, now of the Governor of Bengal. Two sepooy mutinies have occurred here, the first in 1824, when a regiment of Bengal infantry refused to go for service in the Burmese war; the second in the famous mutiny of 1857. Pop. about 11,500.

Barracks (originally derived through the Fr. *baraque*, from the Ital. *baracca*, or the Span. *barraca*) are permanent structures for the accommodation of soldiers, sailors, or police. Great opposition was made in this country to the introduction of permanent barracks during the early part of the last century, on the ground that the liberty of the subject might possibly be endangered by thus separating the soldiery so completely from the citizens, and placing them in the hands of the ruling power. On the other hand, it was contended that the older system of

billeting the soldiers on the people is vexatious and burdensome; and that the morals of towns people and villagers are liable to be vitiated by the constant presence of soldiers. The permanent barracks were few in number down to the year 1792, when George III. obtained the consent of parliament for the construction of several new ones, and for the founding of the office of barrackmaster-general. Various changes in the arrangements were made from time to time. The expenditure for barracks, in building, rebuilding, enlarging, and repairing, between 1793 and 1804, was £4,100,000; between 1804 and 1819, £3,220,000; and between 1819 and 1859 (including Aldershot Barracks, q.v.), upwards of £7,000,000. The cost varied from £27 to £209 per soldier accommodated, according to the inclusion or exclusion of officers' quarters, &c. The barrackmaster-general was replaced at the beginning of this century by commissioners for barracks, whose functions were absorbed in 1822 by the now extinct Board of Ordnance. A committee of inquiry on barrack accommodation was appointed in 1855, and a Royal Commission in 1857; the Barrack and Hospital Improvement Committee was made a permanent body in 1862, and, more than once reconstituted, is now merged in the office of the Director of Barrack Construction, a civilian whose office is under the Master-general of the Ordnance. The Military Works Acts of 1897, 1899, 1901, 1903, voted a total sum of over £14,000,000 for barrack construction, including large camps. The 1899 vote included a sum of £1,600,000 for infantry and artillery barracks at Salisbury Plain; and in the 1903 vote was a sum of £2,300,000 for barracks in South Africa. The estimate for 'Works and Buildings' was, for 1911-12, £2,591,000, and this may be taken as a fair average of recent years; but this includes nearly a million for repayment of old loans. The cost is provided out of revenue, and not by loan, as was done on some former occasions. The duty of designing and estimating for new military barracks was until lately in the hands of the Corps of Royal Engineers, but is now entrusted to a number of civilian architects, working under the Director mentioned above.

The type of barracks is continually evolving, based on the synopsis of barracks laid down by the War Office. This lays down the accommodation required and allowed for each kind of unit, with further details of floor-space and cubic space per man, all the accessories and offices, such as guard-rooms, canteens, recreation-rooms, lavatories, laundries, drying-grounds, cook-houses, stores, sheds. A certain percentage of the rank and file are on the 'married strength,' and these, being thus recognised, are provided with separate quarters of one to three rooms. Everything has, in fact, been done to render life in barracks as healthy as possible, and a great success has been achieved in this direction, the death-rate and the percentage of admissions into hospital, even in India and other tropical parts, having diminished to less than one-half of what they were in 1880. The general site is chosen in a healthy part. Plenty of space is allowed for between buildings. The greatest care is taken to have ample water-supply of the best quality. Access must be had to drill and manoeuvre grounds of suitable size. Recreation-grounds are provided, and, where possible, soldiers' gardens. Senior officers have substantial villas, field-officers two rooms, junior officers one room, and quarters for married officers are often available. The officers' mess, which is essentially a club, is where they practically live. Besides the mess-room it has anterooms, billiard-room, library, and offices. Warrant-officers have separate quarters of a superior kind. Sergeants, in addition

to their sleeping-rooms, have a mess containing dining and reading rooms and kitchen. Both the officers' and sergeants' messes are maintained by monthly subscription. The hospitals are separate buildings, constructed and equipped on the very best methods. The accommodation gives from 900 cubic feet of space for each light case to 1500 cubic feet for infectious cases. School-rooms are also provided both for the men and for the children. In addition there are the guard and orderly rooms, store rooms, workshops, and accommodation for all the multitudinous requirements of army life. The personal comfort of the soldier is catered for by the regimental institute, consisting of the canteen and the recreation establishment. The latter has recreation and reading rooms, lecture-room, library, coffee-room, billiard-room, skittle-ground, gymnasium, and everything tending to render the life of a soldier attractive. For cavalry and artillery the barracks are on a similar plan, with additional accommodation for horses, wagons, guns, stores and shops, and riding-schools. See **ALDERSHOT**.

Barraconda. See **GAMBIA**.

Barraconda, or **BARRAQUDA**, a voracious fish of the perch family, 8-10 feet long, found in West Indian waters. The name is also given to a *Thyrmites* found in the Southern Ocean anywhere between the Cape of Good Hope and New Zealand.

Barrafranca, a town of Sicily, 10 miles SE. of Caltanissetta, with a pop. of 10,000.

Barranquilla, the principal port of the United States of Colombia, lies near the left bank of the main channel of the Magdalena, 15 miles distant from the sea. A railway runs to the coast at Puerto Colombia, some 17 miles westward, and recently the bar at the mouth of the river has been partially removed, so as to enable sea-going vessels to come up to Barranquilla, which possesses excellent wharfage accommodation. The inland traffic by river-steamers is important. The trade is mainly in the hands of Germans. Pop. about 66,000.

Barrantes, **VICENTE**, a Spanish writer, born at Badajoz, 29th March 1829. He early made a reputation by his dramatic pieces, political satires, stories, and ballads. In 1858 he entered the cortes, and in 1872 was elected to the Spanish Academy. Amongst his works are *Viaje a los Infernos*, a political satire, and an historical work on the Philippine Islands. He died in 1898.

Barras, **PAUL - JEAN - FRANÇOIS - NICOLAS**, **COMTE DE**, a prominent figure in the French Revolution, was born June 30, 1755, at Fos-Emphoux in Var, of one of its oldest noble families. In his youth he served against the English in India, but soon returning home, plunged into a life of reckless dissipation at Paris. But he soon found novel impulses in the fever of revolution. A member of the Jacobin Club from the outset, he represented Var in the National Convention, voted for the execution of the king without delay, and had a share in the downfall of the Girondists. He conducted the siege of Toulon, and suppressed, not without great cruelty, the revolt in the south of France. Hated by Robespierre as not decided enough, he attached himself to his opponents, and played the chief part in the tyrant's downfall, being appointed by the terrified Convention virtual dictator for the time. In this capacity he crushed the intrigues of the Terrorists with decision and vigour, and his humanity was said to have saved the reaction from being bloodier than it was. On subsequent occasions he acted with decision both against the intrigues of the Royalists and the excesses of the Jacobins; and on 13th Vendémiaire (5th October)

1795, being again appointed commander-in-chief by the Convention, he called his young friend Bonaparte to his aid, who crushed the insurgent sections, and assured his own future with the historical 'whiff of grape-shot.' The Directory being appointed in November 1795, Barras was nominated one of the five members. On 18th Fructidor (4th September) 1797, he was again made dictator, whereupon he removed his opponents, whom he accused of royalism, from both councils. From this time he guided the state almost alone, until his covetousness and love of pleasure had rendered him so unpopular that Bonaparte, with the help of Sièyes, was able to overthrow him easily on the 18th Brumaire (November 9) 1799. Compelled to remove from the neighbourhood of Paris, he resided in Brussels, then in Marseilles, but was banished to Rome, and thence sent to Montpellier, being kept under constant surveillance of the police, who actually found him to have been engaged in conspiracies for the bringing back of the Bourbons. After the Restoration he returned to Paris, and purchased an estate near the city with part of the great fortune he had acquired in the Revolution. He died 29th January 1829. See his *Memoirs*, edit. by Duruy (trans. 1895).

Barratry, COMMON, or *Barretrie*, is the offence of inciting and stirring up suits and quarrels among the king's subjects. It must be shown that the party accused *frequently*, or at least on more than one occasion, conducted himself in the way imputed. The term is probably the same as the French *baraterie*, which Littré derives from a root *barat* meaning 'fraud.' The punishment for this offence is fine and imprisonment; but if the offender belongs to the profession of the law, he may besides be disabled from practising his profession for the future. And, indeed, it is the existing statute law of England, that if any one who has been convicted of barratry shall practise as an attorney, solicitor, or agent in any suit, he may be kept in penal servitude for not more than seven or less than three years.

Akin to this offence is that of suing another in the name of a fictitious plaintiff. If committed in any of the superior courts, this offence is treated as a high contempt, punishable at discretion, and in inferior courts, by six months' imprisonment, and treble damages to the party injured.

Barratry, in the sense above explained, is not a technical term in the law of Scotland. But in that system there is a word *Baratry*, which is defined as the crime committed by a judge who is induced by a bribe to pronounce a judgment, or who barter justice for money.

There is also *Baratry of Mariners*, which signifies—in the law not only of England and Scotland, but also of France and other European states—the fraud or wrongful act of the master or mariners of a ship tending to the prejudice of the owners of the ship or cargo. Such conduct is one of those risks which are usually insured against in marine policies of insurance. See **INSURANCE**.

Barré, ISAAC, British soldier and politician, was born at Dublin in 1726. Gazetted as an ensign in 1746, he became friendly with General Wolfe, under whom he rose to the rank of lieutenant-colonel. He was wounded in the cheek at Quebec, was beside Wolfe when he fell, and figures in West's picture of 'The Death of Wolfe.' He entered parliament in 1761, and held office successively under Lord Bute, Pitt, Rockingham, and Lord Shelburne. In Pitt's second administration he exposed the corruptions of the ministry, was a strong opponent of Lord North's ministry, and opposed the taxation of America. He died in London, 20th July 1802.

Barrel, primarily a large vessel for holding liquids, next a *measure* for various wares and quantities. The barrel of ale and beer contains 36 imperial gallons. The barrel of herring contains about 800 herrings. *Barrel* also signifies a certain *weight* or other quantity of goods usually sold in casks called barrels; of salt meat, 200 lb.; butter (4 firkins), 224 lb.; soap, 256 lb.; gunpowder, 100 lb.; flour, 196 lb.; and raisins, 112 lb. In America, flour and beef are sold on the large scale in barrels: a barrel of flour must contain 196 lb.; of beef, 200 lb. A barrel of rice contains 600 lb.; of gunpowder, 25 lb.; of fish, salt meat, or bacon, 200 lb.

Barrel-organ, a mechanical organ whose music is produced by a barrel or cylinder, set with pins and staples, which, when driven round by the hand, opens the valves for admitting the wind to the pipes according to the notes of the music. The number of tunes that any one instrument can play is, of course, very limited. Barrel-organs are generally portable, and mostly used by street-musicians; though they were not unknown in English country churches in the 19th century. Superior barrel-organs are driven by a motive-power, but the instrument has been largely superseded by the barrel-piano.

Barren Island, a volcanic islet 60 miles E. of the Andaman Islands, with a diameter of about 2 miles, and a cone reaching a height of 1015 feet. The volcano was active in 1803, and still emits occasionally hot water and sulphureous fumes.

Barrenness. See **STERILITY**.

Barres, MAURICE (1862-1923), French novelist, literary artist, politician, apostle of nationalism, individualism, provincial patriotism, and national energy, was born at Charnes-sur-Moselle.

Barrett, ELIZABETH. See **BROWNING**.

Barthead, in Renfrewshire, 8 miles SW. of Glasgow, has cotton-mills, bleaching, dyeing, print, and sanitary works; pop. 11,500.

Barricades, defence-works formed in streets and roads of beams, chains, *chevaux-de-frise*, and other obstacles, as a defence against besiegers, or as a shelter to insurgents. As early as 1358 the streets of Paris were barricaded against the Dauphin, afterwards Charles V. In 1588 a body of 4000 Swiss soldiers, meant to overawe the Council of Sixteen, were marched into Paris by Henry III., and would have been utterly destroyed by the populace, firing from behind barricades, had the court not consented to negotiation. During the three days of the revolution of 1830, the number of barricades erected across the streets amounted to several thousands. They were formed of the most heterogeneous materials—overturned vehicles, trees, scaffolding-poles, planks, building-materials, and street paving-stones—men, women, and children taking part in their erection. In February 1848, the insurrection against Louis-Philippe commenced with the erection of barricades; but the most celebrated and bloody barricade-fight was that between the populace and the Provisional Government, 23d-26th June 1848, which ended in the defeat of the people. The national losses by this fight were estimated at 30,000,000 francs; 16,000 persons were killed and wounded, and 8000 taken prisoners. Napoleon III. widened and macadamised many of the principal streets of Paris, partly with the express purpose of rendering the successful erection of barricades next to impossible; but in the second siege of Paris (1871), the Communards threw up numbers of strong barricades. There was a remarkable barricade-erection in London in 1821. The ministry desired that the body of Queen Caroline should be conveyed out of

the country to Germany, for interment, without the populace having the opportunity of making any demonstration. On the matter becoming known, a vast barricade was erected at the point where the Hampstead Road joins the New Road, and the officer in charge of the funeral changed his course. In 1848 and 1849 barricades were carried in Paris, Berlin, Vienna, and Dresden, by taking the defenders in the rear.

Barrie, SIR JAMES MATTHEW, baronet 1913, O.M. 1922, was born 9th May 1860, at Kirriemuir, in Forfarshire, and educated there and at Dumfries Academy and Edinburgh University. After some practice as a journalist in Nottingham, he settled in London, and became a regular contributor to the *St James's Gazette*, the *British Weekly* (under the pseudonym of 'Gavin Ogilvy'), the *National Observer*, the *Speaker*, &c. His first volume, *Better Dead* (1887), was largely a satire on London life; in *Auld Licht Idylls* (1888) he opened a new and rich vein, the humour and the pathos of a typical Scottish village; 'Thrums,' his native village, still furnishes the keynote to *When a Man's Single* (1888), nominally a tale of literary life in London; and still more to *A Window in Thrums* (1889). By these three works he was rapidly raised to a front place in contemporary literature. *An Edinburgh Eleven* (1888) contains sketches of Professors Masson and Blackie, Lord Rosebery, and others, and was followed by the slight and sportive *My Lady Nicotine* (1890). *The Little Minister* (1891), his first lengthy story, appeared first as a serial in *Good Words*, and showed his characteristic excellences—grim humour, pathos, power of character-sketching and nature-description, and the gift of veracious and vivacious dialogue, but was fantastic and less true to nature than his shorter tales and sketches. *Walker, London*, a farcical comedy, had a prodigious run at Toole's Theatre in 1892. In 1894 *The Professor's Love Story* was produced on the stage. *Sentimental Tommy* appeared first in *Scribner's* in 1896, and was followed by a second part in 1899. *Margaret Ogilvy* (1896) was a biography of his own mother, and was read with as much interest as the novels. *The Little Minister* was dramatised in 1897. *The Admirable Crichton* was produced in 1903. *Peter Pan* (1904), with its delicate fancy, whimsical humour, and insight into the boy's mind, is the culmination of his dramatic work. Later plays include *What Every Woman Knows* (1908), *Dear Brutus* (1917), *Mary Rose* (1920).

Barrie, a town of Ontario, on Kempenfeldt Bay, Lake Simcoe, with woollen-mills, boiler-works, flour-mills, and breweries; pop. 7000.

Barrier Act. See SCOTLAND (*Ecclesiastical History*).

Barrier Reef, THE GREAT, an immense coral-reef extending along the NE. coast of Australia about 1200 miles, at a distance from the shore of from 10 to upwards of 100 miles, with but seven safe passages for ships (Raines Inlet, &c.) See CORAL, AUSTRALIA, QUEENSLAND.

Barring Out, a practice once common in schools, which consisted in the scholars fastening the doors against the master. The usual time for it was immediately prior to the vacations; and it seems to have been an understood rule that if the scholars could sustain a three days' siege, they were entitled to dictate terms regarding the number of holidays, hours of recreation, &c. for the ensuing year. The masters, in most cases, appear to have acquiesced good-humouredly in the custom; but some chafed at it and exerted their ingenuity; and force to storm or surprise the garrison. Addison, according to Johnson, was the leader of a barring out at Lichfield about the year 1686. One

remarkable and fatal case of barring out occurred at the High School, Edinburgh, in 1595. The town council refused to grant more than three of the eight holidays which the boys demanded as their privilege. They accordingly took advantage of the master's temporary absence to lay in a store of provisions, and having done so, barricaded the doors. The magistrates, the patrons of the school, in vain sought admission, the boys saying they would treat with their master only; and after a day and night had passed, it was resolved to force an entrance. The result was that one of them, Bailie Macmoran, was shot dead on the spot by a scholar named Sinclair. The statutes of Wotton School, Cheshire, founded by Sir John Deane in 1558, ordained that 'a week before Christmas and Easter, according to the old custom, the scholars bar and keep forth the school the schoolmaster, in such sort as other scholars do in great schools.' A barring out forms the theme of one of Miss Edgeworth's stories.

Barrington, GEORGE, pickpocket and convict, was born in 1755 at Maynooth, Ireland, the son of a silversmith named Henry Waldron. In 1771 he ran away from school, and coming to London, turned pickpocket, on one occasion robbing Prince Orloff of a snuff-box, set with brilliants, valued at £30,000. Twice previously convicted, he was finally sentenced in 1790 to transportation to Botany Bay, but having on the voyage out frustrated a conspiracy amongst the convicts, he was emancipated in 1792. He became superintendent of the convicts and high constable of Paramatta in New South Wales, where he died 28th December 1804. His literary achievements are mere fables. He was erroneously credited with a famous prologue to Young's tragedy, *The Revenge*, for a representation at Sydney in 1796 (see *Athenæum*, Feb. 1898, p. 216):

From distant climes, o'er widespread seas, we come,
Though not with much *décor* or beat of drum;
True patriots we, for be it understood,
We left our country for our country's good.
No private views disgraced our generous zeal,
What urged our travels was our country's weal;
And none will doubt but that our emigration
Has proved most useful to the British nation.

Nor was he author of *A Voyage to Botany Bay* (1801), *The History of New South Wales* (1802), and *The History of New Holland* (1808).

Barrington, (1) JOHN SHUTE, 1st VISCOUNT BARRINGTON, the son of a London merchant, was born in 1678, and called to the bar in 1699. In 1704-5 he published his *Rights of Protestant Dissenters*, which gained him the confidence of the Presbyterians. His *Dissuasive from Jacobitism* (1713) recommended him to George I., and he was raised to the Irish peerage as baron and viscount in 1720. He was returned for Berwick in 1715, and again in 1722, but was expelled from the House of Commons in 1723 on account of his connection with a bubble speculation of the time. This excessive punishment was generally ascribed to the malice of Walpole. He died in 1734. His works, mostly theological, were published in 3 vols. in 1828. Of his six sons, the following deserve notice.—(2) WILLIAM WILDMAN, 2d VISCOUNT, his eldest son, born in 1717, sat for Berwick-upon-Tweed in 1740, and until 1778 constantly held office, either in the Admiralty, the War Office, the Exchequer, or the Post-office. He died in 1793.—(3) DAINES, the fourth son, born in 1727, was called to the bar, where he attained a considerable position. His numerous writings embrace law, antiquities, and natural history, but his only important work is his *Observations on the Statutes* (1766). He died in 1800.—(4) SAMUEL, a distinguished naval officer, was the fifth son. In 1787 he was made admiral, and he died in 1800.—(5) SHUTE

(1734–1826), the youngest son, was Bishop of Llandaff, of Salisbury, and (1791) of Durham.

Barringtonia, a genus of Lecythidaceæ (or Myrtaceæ) ranging from East Africa to Samoa. Some species yield oil-seeds and timber.

Barrique, an old French wine-measure. The barrique of Bordeaux was equal to 228 litres.

Barrister is the distinctive name by which the advocates or pleaders at the English and Irish bars are known; and thus its derivation is perhaps sufficiently accounted for. They are admitted to their office under the rules and regulations of the Inns of Court (q.v.), and they are entitled to exclusive audience in all the superior courts of law and equity, and generally in all courts, civil and criminal, presided over by a superior judge. In the whole of the county courts solicitors are allowed to practise without the assistance of counsel; also at petty sessions, though at the quarter sessions where four counsel attend, the justices always give them exclusive audience (see SOLICITORS).

Barristers were first styled *Apprentices*, who answered to the bachelors of the universities, as the state and degree of a serjeant did to that of a doctor. These apprentices or barristers seem to have been first appointed by an ordinance of King Edward I. in parliament, in the twentieth year of his reign (Stephen's *Commentaries*, and authorities there referred to). Of barristers, there are various ranks and degrees, and among each other they take precedence accordingly; the general name, 'counsel,' being, in the practice of the court, common to them all. But they may be divided into two groups—*baristers* and *King's Counsel*. (The ancient order of *serjeants-at-law*, formerly a well-marked third group, was distinguished by the *coif* and other peculiarities, but has now ceased to exist. See *SERJEANT-AT-LAW*.) Barristers simply—technically utter *baristers*—occupy the position of junior counsel, wearing a plain stuff-gown and a short wig; Counsel, King's Counsel—His Majesty's Counsel learned in the law, as they are more formally called—are selected from the outer or junior bar. They are the leaders of the bar, and are distinguished by a silk gown; on state occasions, and always in the House of Lords, they wear a full-bottomed wig. For further details, see *KING'S COUNSEL*. Besides these three orders, the crown sometimes grants letters-patent of precedence, whereby the grantee is entitled to such precedence as may be assigned to him (see *PRECEDENCE*).

Barristers have exclusive audience in all the superior courts, where upon terms and conditions, and according to an etiquette, which are all well understood, they take upon themselves the protection and defence of any suitor, whether plaintiff or defendant. With the *Brief* (q.v.), or other instructions, barristers receive a *fee*, or such fee is indorsed on the brief or instructions, and afterwards paid. Such, generally, is the existing practice at the English bar, differing in this respect from the practice of the bar in Scotland—and, we believe, to a great extent in Ireland also—where prepayment of the fee is the rigid etiquette. The barrister's fee is not a matter of express contract or stipulation, recoverable at law like a solicitor's bill of costs, but is regarded as a mere honorary reward—*quiddam honorarium*, as it is called in law-books. There is therefore no means of enforcing its payment; but where it can be proved that the client or party gave money to the solicitor with which to fee the counsel, the latter may maintain an action against the former for the amount in some special cases.

In order to encourage due freedom of speech in

the lawful defence of their clients, and at the same time to give a check to unseemly licentiousness, it has been held that a counsel is not answerable for any matter by him spoken, relative to the cause in hand, and suggested in his client's instructions, although it should reflect upon the reputation of another, and even prove absolutely groundless (though the publication of the counsel's statement by a *third party* may expose such third party to an action); but if he mentions an untruth of his own invention, or even upon instructions, if it be impertinent to the cause in hand, he is then liable to an action from the party injured; and counsel guilty of deceit or collusion are punishable by the statute Westm. I. (3 Edw. I. chap. 29) with imprisonment for a year and a day, and perpetual silence in the courts—a punishment which may be inflicted for gross misdemeanours in practice, although the course usually resorted to is for the Benchers of the Inn of Court to which the person so offending belongs, to *disbar* him (see *INNS OF COURT*, *DISBAR*).

Besides advocacy and forensic disputation, barristers in England advise on the law by giving an opinion on a case stated—'opinion of counsel;' they also draw or prepare the pleadings or statements of fact on which an action is founded; and they prepare or revise the drafts of deeds and other instruments and of private bills (see the article *CONVEYANCING*). As a correlative privilege of the position in which they stand in respect of their fees, barristers are not personally liable for the injurious consequences of any erroneous advice they may give; and they claim absolute control over the conduct of all litigation in which they may be engaged, even to withdrawing it from court, unless the client expressly dissent; and until lately, it was the opinion of the profession that counsel might at any time, during the progress of a cause, compromise the matter in dispute; but the exercise of such discretion has been successfully opposed, and it is now admitted that barristers have no *ex officio* privilege beyond the guidance and conduct of actual litigation in court.

It is from the body of barristers that all the judges in England, superior and inferior, are appointed; and barristers are also always chosen for the office of paid magistrate. The only exception to the exclusive appointment of barristers to judicial offices is the case of justices of the peace (see *QUARTER SESSIONS*).

The bar in Ireland stands on the same footing, and has the same ranks and degrees, and is subject very much to the same rules and regulations, as the English bar; and in that country, barrister also is the name by which the profession of an advocate is distinguished. In Scotland, the same office is simply called by its own name of *Advocate* (see *ADVOCATES*, *FACULTY OF*).

At the bar of the House of Lords, and before parliament generally, before the privy-council, and also, it is believed, in all trials for high treason, whether in England, Ireland, or Scotland, the three bars rank on a footing of equality, taking precedence according to the date of their call and admission to their own respective bars, with the exception of King's Counsel. In Scotland, the latter are next in precedence to the Lord Advocate (see *ADVOCATE*, *LORD*), the Solicitor-general of Scotland (q.v.), and the Dean of the Faculty of Advocates. It was at one time disputed between the Lord Advocate of Scotland and the Attorney-general of England, which of them should lead the other at the bar of the House of Lords; and a struggle for precedence occurred in 1834 in the House of Lords, before Lord Chancellor Brougham, between Campbell (afterwards Chancellor) as Attorney-general, and Jeffrey as Lord Advocate. The

latter contended that as he was not only the first law-officer of the crown in Scotland, but also a high political officer, he was entitled to lead the former. But the House decided that the Attorney-general of England has precedence over the Lord Advocate of Scotland, in all matters in which they may appear as counsel at their lordships' bar. The relative rank of the *Irish* law-officers to English is the same. It only remains to add, that as the three bars are on a footing of equality in the House of Lords, and before the other imperial tribunals above mentioned, the English bar have no exclusive audience in these, even in English cases.

Revising Barrister was a barrister appointed annually by the English judges to revise the lists and settle who were the persons entitled to vote for members of parliament. For this purpose England was subdivided into districts, and a barrister appointed for each district by the senior judge of assize. The powers and duties of the revising barrister were defined by the Registration Act of 1878. Under the Representation of the People Acts (1918-21), the revising barrister has gone and his duties have been taken over by the county court, the clerk to the county council in the county, or the town clerk of a municipal borough. There are now two revisions yearly, the autumn revision commencing on the 15th October, and the other on the 15th April.—Similar duties are performed in Scotland by the sheriffs.

Barros, João de, the most distinguished of Portuguese historians, was born at Vizeu in 1496, and died in 1570. He wrote an historical romance which attracted much admiration, and in 1522 he was appointed governor of the Portuguese settlements in Guinea, in 1532 treasurer of the Indies. Hereupon the king assigned him the task of writing the history of the Portuguese in India, which he undertook. But only the first four decades, down to 1526, proceeded from his pen, under the title of *Asia Portuguesa*; the continuation was the work of Diego de Couto.

Barro'sa, a village of Spain, 16 miles SSE. of Cadiz, celebrated in history as the place where General Graham (afterwards Lord Lynedoch), March 5, 1811, with a handful of English troops, brilliantly defeated the French. The name is in Britain often incorrectly spelt Barossa.

Barrot, Camille Hyacinthe Odilon, a prominent French statesman, born at Villefort, Lozère, 19th July 1791. At nineteen he pleaded before the ordinary tribunals, and at twenty-three, by a special dispensation, before the Court of Cassation, Paris, and early acquired a high reputation for eloquence. In the political arena also, his oratory soon made him one of the most influential leaders of the liberal opposition. He became president of the 'Aide-toi' Society in 1830, and at the July revolution in that year, was one of the three commissioners appointed to conduct the dethroned Charles X. to Cherbourg, on his way to England. On his return he was appointed prefect of the department of the Seine, and member of the Council of State, but in a few months resigned his offices to lead the opposition to Casimir Périer and the reactionary ministers who followed him. He supported Thiers from his accession to office in March 1840 to his fall in October, when he resumed his opposition to the ministry of Guizot. He took a conspicuous part in the reform movement of 1847, and spoke eloquently at several of the provincial reform banquets which led to the revolution of February 1848. Made president by Thiers in his short-lived ministry, he advised the king to withdraw his troops and thus remove the last obstacle to the downfall of his throne. In the last sitting of the

Chamber of Deputies, he supported the claim of the Count de Paris to the throne, and the regency of the Duchess of Orleans. The February revolution considerably abated his ardour for public liberty. He held office for some time under the presidency of Louis Napoleon, but retired from active political life after the *coup d'état*, 2d December 1851. In July 1872 he was made a councillor of state and vice-president of the council; but he died at Bougival, near Paris, 6th August 1873. His *Mémoires Posthumes* appeared at Paris (4 vols. 1875-76).

Barrow, a sepulchral mound of earth or stones raised over the site of a burial as a mark of honour to the dead. The barrows of the Stone Age in Europe are mostly constructions of stones, oblong, oval, or circular on the ground-plan, and containing chambers for the reception of the burials. A passage opening from the exterior gives access to the chamber, which is usually situated at or near the centre of the barrow. The chambered barrows, which are peculiar to the Stone Age of Britain, are

Plan of Chambered Barrow or Cairn, at Garrywhin, Caithness.

now structureless heaps in external appearance, but were originally faced with dry-walling on the external outline of the ground-plan. The oblong variety is occasionally from 200 to 300 feet in length, and sometimes contains several chambers. Commonly, however, the chamber is situated at one end of the barrow, which in many cases faces the east, and is usually higher than the other end. The passage leading into the chamber starts from between two concave or convex projections of the end of the barrow. It is commonly low and narrow towards the exterior, increasing in height and width as it approaches the chamber. The framework, so to speak, of the chamber and passage is commonly constructed of very large stones, and hence these chambers are often referred to as *megolithic*, and the framework of such a chamber, whether covered with a mass of smaller stones and earth, or uncovered, is called a *dolmen*, and often, erroneously, a *cromlech*. The passages are usually lintelled over with great flat stones, but the roof of the chamber is constructed of beehive vaulting (see BEEHIVE HOUSES). The chamber is often divided into compartments by partitions of slabs, or has smaller chambers opening from its sides. The burials in the chambered barrows are mostly after cremation, accompanied by urns of dark-coloured, hard-baked paste, with rounded or hemispherical bottoms.

The oval and circular barrows with internal chambers are smaller, and probably later than the long barrows. They also have their external outline defined by dry-walling, and are sometimes surrounded by a trench, or by a ring-fence of standing stones. The mode of burial is the same as in the long barrows, chiefly after cremation, accompanied by urns of the same character, and by implements, weapons, and ornaments of stone and bone. Indications of funeral feasts occur in all the chambered barrows, the deposits being intermixed with bones of the domestic animals—the horse, ox, dog, sheep, swine, and occasionally the red-deer, and various species of fish and fowl. The chambered barrows of Brittany and Denmark differ from those of Britain in having their chambers flat-roofed, often with a single stone of enormous size.

The barrows of the Bronze Age in Europe are circular in form and unchambered. They are characterised by single burials, placed in cists, or simple inclosures of flat stones, like chests, the sides, ends, and cover each formed of a single slab. A barrow may contain one or many cists, but the principal burial is usually near the centre. The cists may be placed on the original surface, or at some depth beneath it. The burials in them are commonly burnt, but often unburnt, this varying with the locality. Both burnt and unburnt interments may be accompanied by urns, but occasionally no urn is present. Sometimes a barrow may contain no cists, but simply deposits of burnt bones inclosed in large cinerary urns set in the soil, or with the urns inverted over them. The urns associated with burnt burial differ in form and purpose from those usually found with unburnt burial. The cinerary urn in Britain is large and wide-mouthed, and ornamented only on the upper part. The urns set in the cists with unburnt bodies are of two varieties—one somewhat bowl-shaped, tapering to a narrow base, nearly as wide as it is high; and the other tall, thin-lipped, and bulging below. Both varieties are usually ornamented over the whole surface.

The barrows of the Iron Age in Europe are mostly earthen mounds. In Britain they are few in number. The Anglo-Saxon burial-places of the heathen time are often cemeteries of graves undistinguished by barrows or mounds upon the surface. In Scandinavia, some of the larger barrows have chambers constructed of timber, but without passages. Such was the barrow of Queen Thyra at Jellinge, in Jutland, erected in the 10th century. The three great mounds or barrows at Uppsala, in Sweden, contained burnt burials of the early Iron Age. In the later 'Viking time,' unburnt burial was the common practice. Some of the larger Viking barrows contained the ship, fully equipped as she rode the sea, and the owner laid in state in a house constructed on the deck, as in the case of the Viking ship discovered in 1880 at Gokstad Sandefjord, and now in the museum at Christiania.

The erection of barrows as marks of distinction in burial appears to have been a common custom among the early races, whether of high or of low culture and civilisation. It is repeatedly referred to in the Homeric poems. The barrows raised over the burnt bones of Hector and of Achilles and Patroclus are described as constructed of stones and earth, like those of prehistoric times, but unchambered. Herodotus describes the Scythian custom of barrow-burial as existing in his time; and in the case of the barrow raised over Hephæstion, the friend of Alexander the Great, we have the cost of its construction stated at 1200 talents, which has been computed as equivalent to something like £232,500 sterling. See Canon Greenwell's *British Barrows* (Oxford, Clarendon Press, 1877), and other works cited at *ARCHÆOLOGY*; also *BURIAL*.

Barrow, a term applied to three prominent localities of the Arctic Ocean, in honour of Sir John Barrow.—(1) *Point Barrow*, on the northern coast of Alaska, in 71° 23' N. lat. and 156° 31' W. long., long received as the most northerly spot on the American mainland (but see BELLOT STRAIT, BOOTHIA).—(2) *Cape Barrow*, on the northern coast of Canada, or Coronation Gulf, 68° N. lat., 111° W. long.—(3) *Barrow Strait*, the earliest of Parry's discoveries, leading to the west out of Lancaster Sound, which Parry's immediate predecessor, Captain, afterwards Sir John Ross, had pronounced to be landlocked in that direction. Besides its main course to Melville Sound, Barrow Strait throws off Prince Regent's Inlet to the south, and Wellington Channel to the north. The passage averages about 50 miles in breadth, extending pretty nearly along the parallel of 74° N., from 85° to 100° W.

Barrow, a river in the south-east of Ireland. Of the Irish rivers, it is in importance next to the Shannon. It rises in the north of Queen's County, on the north-east slope of the Slieve Bloom ridge of mountains. It flows first east past Portarlington to the border of County Kildare, and then southward, passing the towns of Athy, Carlow, and New Ross. It has a course of 100 miles through a carboniferous, granitic, and silurian basin. Two miles above New Ross it receives the Nore, and 8 miles east of Waterford, it is joined by the Suir (q.v.). These three rivers (called the Three Sisters) form, near the sea, the large and secure estuary of Waterford harbour, 9 miles long. The Barrow is navigable for ships of 300 tons to New Ross, 25 miles up, and for barges to Athy, 65 miles up, whence the Grand Canal communicates with Dublin.

Barrow, ISAAC, a mathematician and divine, was born in 1630 in London, where his father was linen-draper to Charles I. At the Charterhouse he was chiefly distinguished for pugnacity; but at Felstead, in Essex, his next school, he greatly improved; and in 1643 he was entered at Peterhouse, Cambridge, under his uncle, Isaac Barrow, then a fellow of that college, and finally Bishop of St Asaph. In 1645, before he had come into residence, his uncle was ejected; so he went instead to Trinity College, where he became B.A. in 1648, fellow in 1649, and M.A. in 1652. Finding that to be a good theologian he must know chronology, that chronology implies astronomy, and astronomy mathematics, he applied himself to the latter science with distinguished success. To the classics he had already devoted much study, and on the vacancy of the Greek chair (1654), he was recommended for the office; but a suspicion of Arminianism is said to have interfered with his success. After this disappointment he went abroad (1655), and travelled four years through France and Italy, to Smyrna and Constantinople, back to Venice, and home through Germany and Holland. On the voyage from Leghorn to Smyrna, his determined personal courage seems to have been instrumental in scaring away an Algerine pirate, after a brisk exchange of shots. Soon after his return he took orders (1659), and in the following year was appointed professor of Greek. In 1662 he received the chair of Geometry at Gresham College, London, which, on his appointment to the Lucasian professorship of Mathematics at Cambridge (1663), he thought it his duty to resign. The latter also he resigned in 1669, in favour of his pupil Isaac Newton. On quitting his professorship, he obtained from his uncle a small sinecure in Wales, and from Dr Seth Ward, Bishop of Salisbury, a prebend in that cathedral. He devoted the revenues of both to charitable purposes, and resigned them in 1672, on being appointed by the king Master of Trinity College. To him, while in this office, is

due the foundation of the Trinity library, which is one of the chief ornaments of Cambridge. In 1675 he was nominated vice-chancellor of the university; in 1677 he died on a visit to London, and was buried in Westminster Abbey. He was only 47, but by his writings and the force of his personal character, he had achieved a reputation which time has left unimpaired. Of his mathematical works, the principal are his *Lectiones Geometricæ* and *Lectiones Opticæ*, on which his contemporary fame was chiefly based, and which show him as an immediate precursor of Newton and Leibnitz. As a theologian, his fame rests mainly on his posthumous *Treatise on the Pope's Supremacy*, and on his eloquent sermons, unmatched as specimens of clear, exhaustive, vigorous discussion. Their length, we may add, was excessive. One, on charity, lasted three hours and a half; and at Westminster Abbey, he once detained the audience so long that they got the organ to play 'till they had blowed him down.' Far the best edition of Barrow's English theological works is that by the Rev. A. Napier (9 vols. Camb. 1859), with a memoir by Dr Whewell, who in 1860 also edited his Latin mathematical works, some of which have been translated.

Barrow, SIR JOHN, was born of humble parentage at Dragley Beck, Lancashire, in 1764, and educated at Ulverston. Having for three years been timekeeper in a Liverpool iron-foundry, he made a voyage (1781) on a Greenland whaler, and after his return taught mathematics in a school at Greenwich. In 1792 he received the post of private secretary to Lord Macartney, ambassador to China; and he availed himself of his residence in China to learn the Chinese language, and to collect valuable materials, which he afterwards gave to the world, partly in articles in the *Quarterly Review*, and partly in his *Travels in China* (1804). When in 1797 Lord Macartney became governor of Cape Colony, Barrow made extensive excursions in the interior, which he described in his still valuable *Travels in Southern Africa* (1803). In 1804 he was appointed by Lord Melville secretary to the Admiralty, which situation he retained till 1845, except for a short time in 1806. Barrow also published *A Voyage to Cochin-China* (1806), *The Life of Macartney* (1807), *A Chronological History of Voyages into the Arctic Regions* (1818), *Voyages of Arctic Discovery* (1846), besides a series of lives of naval worthies. Under Peel's ministry, in 1835, he received a baronetcy. In 1845 he retired from public service, and he died in London, 23d November 1848. He rendered signal service to geographical science by suggesting and promoting Arctic expeditions; and Barrow Strait, Cape Barrow, and Point Barrow preserve his memory. He may also be claimed as the founder of the Geographical Society (1830), of which he was vice-president till his death. See his Autobiography (1847), and the Memoir by Staunton (1852).

Barrow-in-Furness, a seaport and manufacturing town of North Lancashire, situated on the south-western coast of the peninsula of Furness, opposite a small island called Barrow Island (traditionally a burial-place of Norse rovers), now forming part of the port. Barrow-in-Furness is 20 miles WNW. of Lancaster, and 265 NNW. of London. In 1847 it was a fishing-village of 325 inhabitants; in 1864 the population had risen to 10,608, in 1871 to 18,245, in 1881 to 47,111, and in 1921 to 74,254. This rapid increase, matched in Great Britain by few towns far from London, is owing to Mr H. W. Schneider's discovery in 1840 of extensive deposits of rich hæmatite ore at Park, near Barrow; to the establishment of mines, smelting-works, shipbuilding yards, &c.; and to the laying of railways throughout the district (famed

for its lake scenery), the Furness Railway Company having constructed 108 miles of line during 1846-47. In 1859 smelting-works were established; in 1866 these were amalgamated with the Bessemer Steel Company, founded three years before, as the Barrow Hæmatite Iron and Steel Company, which ere long had 14 blast-furnaces in operation, turning out yearly 360,000 tons of pig-iron and 220,000 tons of Bessemer steel. Copper and slate are also found in the neighbourhood.

The town is built on a regular plan, mostly in rectangles, with broad streets, traversed by electric tramways. In 1872 a statue was unveiled of the first mayor, Sir James Ramsden, and in 1885 one of Lord Frederick Cavendish. The town-hall was built in 1887. There are a technical school (1911), a school of science and art, besides higher-grade schools and girls' schools.

The Dukes of Devonshire and Buccleuch are the principal landowners of the town and neighbourhood. The docks, covering 278 acres of water-space and 24 feet in depth, belong to the Furness Railway Company. The Devonshire (32½ acres) and Buccleuch (31 acres) docks were opened by Mr Gladstone in 1867; in 1877 were added the Ramsden Dock (60 acres), used by the Anchor Line, and the Cavendish Dock (146 acres), which was leased to Messrs Vickers for airship purposes. Among other equipments there are large lifting and graving docks and cranes. Barrow Island has since 1871 become the seat of great shipbuilding yards, Messrs Vickers' works on the island extend over 100 acres. This firm, which employs thousands of hands, has accommodation for building, at one time, about a score of merchant or war ships of the largest type, and turns out in addition boilers, oil-engines, huge guns, shells, and all manner of machinery and munitions on a vast scale. On Walney Island it has an airship factory and a colony, Vickerstown (founded 1901), for its work-people. Walney Island (ten miles long by one wide) is separated from the mainland at Barrow by a narrow strait, which in 1908 was bridged by a great structure, 1123 feet long, with an opening span of 120 feet. Flax and jute works were erected in 1872. There are besides engineering, furnace-building, boiler-making, paper pulp, and other works, brewing, petroleum-stores, timber-yards. The imports include timber, ore, coal, flour, grain, petroleum, and preserved provisions. The chief exports are ore, steel rails, and pig-iron. A regular passenger service is maintained with Belfast. Thanks to its docks, railway, mineral wealth, and industries, Barrow may claim to command the 'sinews of war' and the material sources of permanent peace-time well-being for its inhabitants. The interesting ruins of Furness Abbey lie within 2 miles of the town; while on Piel Island there are the ruins of the Pile of Fouldrey, built in Stephen's reign by the Abbot of Furness. A municipal borough (1867), county borough (1888), Barrow since 1885 has returned one member to parliament.

Barry, (1) a small island in the Bristol Channel, off the south coast of Glamorganshire, 12 miles SW. of Cardiff. It has the ruins of an ancient castle and of two chapels.—(2) A town and important seaport opposite Barry Island, 7 miles SW. of Cardiff by rail, in the Llandaff and Barry parliamentary division of Glamorganshire. It has extensive docks, covering an area of 120 acres between the town and the island, with about 40 coaling-tips, and having direct railway communication with all the South Wales coalfields. The first dock was opened in 1889, when Barry was a village with 70 inhabitants. Since that time the coal traffic has increased manifold. The docks are open at all states of the tide, and there is extensive graving accommodation. The municipality

owns the gas and water works, maintains public schools, libraries and reading-rooms, public parks, hospitals, and a sanatorium. The town, with the island, is also becoming a favourite seaside resort. Pop. 40,000.

Barry, COMTESSE DU. See DU BARRY.

Barry, Sir Charles, R.A., F.R.S., architect, was born at Westminster in 1795, visited Italy, and by 1823 was a well-known architect. He built Manchester Athenæum, Grammar-school at Birmingham, the Travellers' Club and the Reform Club, and the College of Surgeons. His design for the new houses of parliament was selected (1836), but he died (12th May 1860) before their completion by his son, Edward Middleton Barry (1830-80). See the Life of Sir Charles Barry by his second son, Alfred Barry, Bishop of Sydney and Primate of Australia.—Another son, Sir John Wolfe Wolfe-Barry, K.C.B., F.R.S., born in 1836, became one of the most eminent engineers of his time, his works including the Blackfriars and Tower bridges, docks at Barry, Hull, and Middlesbrough, and railway works in India, China, and elsewhere. He died 22d January 1918.

Barry, Elizabeth (1658-1713), created over 100 rôles in tragedy and comedy, including some of the most famous characters of Otway's and Congreve's plays. Of her life little is known. She is said to have been introduced to the stage by Rochester, and to have been a very unpromising pupil.

Barry, James, an historical painter, born at Cork, 11th October 1741. He was a protégé of Edmund Burke, through whose liberality he studied for about four years in Italy (1766-70). On his return he was chosen a member of the Royal Academy, and in 1782 professor of Painting. He was of irritable temper, quarrelled with the Royal Academy, and was expelled. He died in poverty on 22d February 1806. His *chef-d'œuvre* is the 'Victors at Olympia,' one of six paintings to ornament the room of the Society of Arts. His letters and writings on art were published with a memoir by Fryer in 1809.

Barry, Martin, a physiologist of eminence, was born at Fratton, Hampshire, in 1802. He studied at the medical schools of London, and at several on the Continent, and took his degree of M.D. in Edinburgh in 1833. He wrote much on physiological subjects, and especially on animal development and embryology. He was elected a member of the Royal Society in 1840. In 1844 he was appointed house-surgeon to the Royal Maternity Hospital, Edinburgh. His means being ample, he gave his professional services largely to the poor. In 1853 he settled at Beccles, in Suffolk, where he died in April 1855.

Barry, Spranger (1719-77), born in Dublin, was first a silversmith, then a successful actor, came to London and acted with Garrick, whose rival he subsequently became. He was great in *Hamlet* and *Macbeth*, and as Romeo (to Mrs Cibber's Juliet). His wife, Ann Street (1734-1801), widow of an actor named Dancer, was a distinguished actress.

Barry. See HERALDRY.

Barry Cornwall. See PROCTER (BRYAN WALLER).

Bar-sinister. See BATON-SINISTER.

Bar-sur-Aube, a small town of France, in the department of Aube, situated on the right bank of the river of that name, 137 miles ESE. of Paris by rail. It has a pop. of 4000, employed in weaving and the manufacture of brandy. Here a council of the allied sovereigns was held on 25th February 1814; and here, two days after, the French were defeated by the allies.

Bar-sur-Seine, an ancient town of France, in the department of Aube, pleasantly situated on the left bank of the Seine, 21 miles SE. of Troyes by rail. Dyeing, and the manufacture of paper and brandy, are its industries. Pop. 3000.

Bartas, Guillaume de Saluste du, soldier, diplomatist, and man of letters, was born at Montfort, in Armagnac, in 1544, and died in 1590 of wounds received at the battle of Ivry. His chief poem, *La Sepmaine*, gives an account of the creation, and is said to have had a considerable influence on Milton's *Paradise Lost*. Thirty editions of the work passed through the press in six years. Joshua Sylvester (1563-1618) Englished *Du Bartas his Divine Weeks and Works* (1598).

Barter, in commerce and political economy, a term used to express the exchange of one commodity for another, as contrasted with the sale of commodities for money. It is simply a primitive form of exchange carried on in countries in which the use of money has not yet been introduced or is not prevalent. It was an economic stage through which all communities must have passed. Even yet in many rude countries barter is very common; and European travellers find it convenient to take with them weapons, tools, and ornaments to exchange with the natives for their commodities. In civilised communities barter is a very exceptional thing, having been superseded by the use of money in various forms.

In law, barter, or exchange, as it is now more generally called in law-books, is a contract for transferring property, the consideration being some other commodity; or it may be described as a contract for the exchange of two subjects or commodities. It thus differs from *sale*, which is a contract for the transference of property in consideration of a price in *money*. See EXCHANGE; SALE OF GOODS.

Bártfa, Bartfeld, or Bardiov, a small but very old town of Czechoslovakia, on the river Topla, near the borders of Galicia. Its hot baths have properties like those at Spa. Pop. 7000.

Barth, a seaport town of Prussia, 21 miles W. of Stralsund, at the mouth of the Barth, which forms its harbour; pop. 10,000.

Barth, Heinrich, one of the greatest modern scientific travellers, was born at Hamburg, 16th February 1821. He studied at Berlin, and, after visiting Italy and Sicily, in 1845 passed over to Tangier in Africa, and made excursions into the interior, to Tunis, Tripoli, and Bengazi. On his journey thence to Cairo, he was attacked, wounded, and plundered by a band of Arab robbers. He afterwards extended his researches into Egypt, Sinai, Palestine, Asia Minor, and Greece. An account of part of these travels appears in his *Wanderungen durch die Küstenländer des Mittelmeeres* (1849). He was next appointed by the British government, along with Dr Overweg, scientific companion to Mr James Richardson, at that time charged with a political and commercial mission to Central Africa. Starting from Tripoli early in 1850, Dr Barth and his companions crossed the Great Desert amid many difficulties and dangers. Barth soon separated from his friends, who both succumbed to the climate, and continued his explorations, which extended from Tripoli in the north to Adamawa in the south, and from Bagirmi in the east to Timbuktu in the west, upwards of 12,000 miles. The result of his researches appeared in his *Travels and Discoveries in Central Africa*, 5 vols. (1857-58). Afterwards he made several journeys in Greece, Turkey, and Asia Minor. He died at Berlin, November 25, 1865. In 1858 appeared a book on his travels in Asia Minor, and in 1862-66 his great

work on the vocabularies of the Central African tribes.

Barth, or **BART, JEAN**, a French naval hero, the son of a fisherman, born in 1651 at Dunkirk, served first in the Dutch navy under De Ruyter, but on the commencement of the war with Holland passed over to the French service. As his humble birth made promotion hopeless, he became captain of a privateer, and distinguished himself so greatly that Louis XIV. at last appointed him lieutenant of a man-of-war. In 1691 he commanded a small squadron in the North Sea, where he destroyed many English vessels, and made a descent on the coast near Newcastle. In 1694, after a desperate struggle with a superior Dutch fleet, he recaptured a large flotilla of corn-ships, and steered them safely into Dunkirk. Soon after, being caught at a disadvantage by the English, he was taken prisoner and carried to Plymouth, but he soon managed to make his escape in an open fishing-boat to France. The king received him with distinction at Versailles, but at the same time spoke continually of the mischance which had befallen him the year before. Stung by this, Barth hastened to Dunkirk, and in spite of the blockade of the harbour by the English, undertook a cruise in which he was remarkably successful. At a personal audience in 1697, Louis XIV. appointed him to the command of a squadron, on which the honest seaman bluntly thanked the king in the words: 'Sire, you have done well in this.' The courtiers were shocked at the freedom of the speech; but the king took the answer in good part, and Barth soon justified his confidence. The peace of Ryswick terminated his active career. He died at Dunkirk, April 27, 1702. His rough frankness and coarse wit, which spared neither high nor low, made him popular, no less than his boldness and readiness for battle.

Barthélemy, **AUGUSTE MARSEILLE**, a French poet and politician, was born at Marseilles in 1796. Educated at the Jesuit College of Juilly, he came to Paris in 1822, and soon made himself famous by a series of vigorous and pointed political satires in verse, directed against the Bourbons, and full of suggestive regrets for the glories of the empire. In *Napoléon en Égypte* (1828), and still more in his elegy for Napoleon's son, *Le Fils de l'Homme* (1829), he spoke out his imperialism more boldly, and the latter occasioned his imprisonment on the eve of the revolution of July. His liberation of course was immediate; and along with his friend Méry, he celebrated the victory of the people in a poem dedicated to the Parisians, and entitled *L'Insurrection*. During all the changes which followed, Barthélemy was indefatigable as a brilliant versifier on the political events of the day; though, in his later years, his popularity somewhat declined. He was, from the first, a warm supporter of the second Napoleonic régime. Some of his sayings are memorable, as the oft-quoted, 'L'homme absurde est celui qui ne change jamais.' His death took place, 23d August 1867, at Marseilles, of which city he was librarian.

Barthélemy, **JEAN JACQUES**, a learned French antiquary, born 20th January 1716, at Cassis, in Provence. Educated for the church, he early devoted himself entirely to the study of oriental antiquities, especially numismatics, but he retained the dress and title of an abbé. In 1745 he became attached to the Royal Cabinet of Medals, and in 1753 was appointed its director. Next year he visited Rome in the suite of M. de Stainville, the French ambassador, who, as Duc de Choiseul, became French minister in 1758, and soon after, by means of a liberal pension, placed Barthélemy in a position to devote himself entirely

to learned researches, which he quietly pursued till the revolution of 1789 deprived him of his offices. In September 1793 he was imprisoned on charge of being an aristocrat, but almost immediately released. Shortly after, he was offered the situation of national librarian then vacant, but his age and infirmities compelled him to decline it. He died April 30, 1795.

His most celebrated and popular work is the *Voyage du jeune Anacharsis en Grèce dans le Milieu du quatrième Siècle avant l'Ère Chrétienne* (4 vols. 1788), which shows an extensive knowledge of the ancient world, especially of Greece and its colonies, and abounds in observations which, if not profound, are at least judicious. Later and more severe criticism has, however, pointed out many deficiencies and anachronisms. It has been translated into almost every European language. Among Barthélemy's other works may be mentioned *Réflexion sur quelques Monuments Phéniciens* (1750), and *Réflexion sur l'Alphabet et la Langue de Palmyre* (1754). The first complete edition of his works was that of Villenave (4 vols. 1821), with a biography.

Barthélemy Saint-Hilaire, **JULES**, French savant and statesman, was born at Paris on the 19th of August 1805. On the completion of his studies he filled for some time a subordinate office under the minister of finance, while actively contributing as a liberal publicist to such newspapers as the *Globe* and the *Nation*. About the close of 1833 he turned from political strife to quieter studies, and in 1838 was appointed to the chair of Greek and Roman Philosophy in the Collège de France. In 1839 he became a member of the Academy. The revolution of February 1848 brought him once more into the political arena. He entered the Assembly, and became one of the leaders of the moderate party. At the *coup d'état* he was one of the patriots who were arrested and flung into prison. On his release he resigned his chair, as he could not take the oath of allegiance to Napoleon III., and returned to his studies, especially Sanskrit and ancient Indian philosophy. Elected in 1871 to the Assembly at Bordeaux, he gave constant support to Thiers. In 1876 he was elected a life-senator by the Assembly; and he held the portfolio of foreign affairs in Ferry's ministry, 1880-81.

His most important work is his French translation of Aristotle, various parts of which appeared from 1837 to 1883. Next to this are his contributions to western knowledge of Indian philosophy in the works, *Sur les Védas* (1854), *Du Bouddhisme* (1855), *Le Bouddha et sa Religion* (1859), and in numerous contributions to the *Mémoires* of the Academy and the *Journal des Savants*. He translated the *Iliad* in verse (1869), and wrote on the Alexandrian school, on Mohammed, on British India (1887), on science and religion (1889), and on Lord Bacon (1890); and at his death, 25th November 1895, was finishing a translation of Plato.

Barthez, **PAUL JOSEPH**, a French physician, was born December 11, 1734, at Montpellier, where he settled as a professor, in 1785 as chancellor of the university, and where consultations with him on serious cases were sought from all parts of the civilised world. The Revolution deprived him of the greater part of his property; but Napoleon heaped honours and dignities upon him in his old age. He died October 15, 1806. Of his numerous writings, his *Nouveaux Éléments de la Science de l'Homme* (Montpell. 1778; 3d ed. Paris, 1858) was translated into most of the languages of Europe, and strongly supports the theory of vitalism and formative force.

Bartholdi, AUGUSTE, sculptor, a native of Colmar, Alsace, of Italian ancestry on his father's side, was trained in the studio of Ary Scheffer, and amongst other works has executed the Lafayette statue, New York; Vercingetorix, the Gaulish leader, now in the galleries of the French government; the 'Lion of Belfort,' and 'Grief.' That France should present to America some symbol in connection with the centenary of American independence occurred to him in 1874; the scheme took shape, and in November 1886 the gigantic bronze statue, 220 feet high, of 'Liberty enlightening the World,' completed in 1884, was unveiled on Bedloe's Island, New York Harbour. Bartholdi, who was born in 1834 and died in October 1904, received the cross of the Legion of Honour in 1887.

Bartholin, KASPAR, born in 1585 at Malmö; studied theology and philosophy at Rostock and Wittenberg, and in 1610 was made doctor of medicine at Basel. He practised for some time in Wittenberg, and in 1613 accepted an invitation to be professor of the Greek Language and of Medicine at Copenhagen, where in 1624 he became professor of Theology. He died at Sorø in 1629, after having written nearly fifty works on various subjects.—THOMAS BARTHOLIN, son of the above, and equally celebrated as a philologist, naturalist, and physician, was born in 1616. He became in 1647 professor of Mathematics at Copenhagen, and in 1648 was nominated to the chair of Anatomy. He died in 1680. He enlarged his father's *Anatomy* (1641) with new observations, and defended Harvey's doctrine of the circulation of the blood.

Bartholomæus Anglicus. See *ENCYCLOPÆDIA*; and Steele's *Medieval Lore* (1893).

Bartholomew, ST, one of the twelve apostles, supposed to be the same person as Nathanael, and was a native of Galilee. According to the traditionary record of Eusebius, he carried Christianity into India; Chrysostom speaks of him as a missionary in Armenia and Asia Minor. The church at Rome bearing his name claims to preserve his relics. The Roman Church holds his festival on the 24th August; the Greek on the 11th June. The primitive church possessed an apocryphal gospel under his name, but it is now lost.

Bartholomew, MASSACRE OF ST (Fr. *La St-Barthélémy*), the appellation given to the massacre of the Huguenots in Paris on the night of St Bartholomew's Day, 24th August 1572. After the death of Francis II. in 1560, Catharine de' Medici assumed the management of affairs, as regent for her son, Charles IX., and showed throughout a more than Italian craft and faithlessness, as well as a cruelty almost without parallel in modern history. In order to annoy the Catholic party of the Duke Francis of Guise, she granted an edict of toleration to the Reformed, at whose head was the Prince of Condé. Both parties took up arms, and there ensued a war which lasted for eight years, the cruelties of which, through mutual exasperation, are almost incredible. Guise was assassinated, and Condé was taken prisoner in the battle of Jarnac and shot (1569). His nephew, young Henry of Béarn, afterwards Henry IV., then became leader of the Huguenots, along with Admiral Coligny. It was not till the strength of both sides was exhausted, that the peace of St Germain-en-Laye was concluded in 1570, whereby the Huguenots obtained the free exercise of their religion. Catharine de' Medici, using one party after another for her own purposes, like the Machiavellian she was, pagan rather than Catholic, brought about the marriage of the youthful Henry of Béarn with her daughter Margaret, 18th August 1572. The king, a weakling easily swayed from

one side to another, at this time held Admiral Coligny in high favour, and had assigned him an important place in the council of state. When the marriage of Piince Henry had attracted the most eminent of the Huguenots to Paris, Admiral Coligny was shot in the street on 22d August 1572. The king swore to avenge him, but on the very same day was persuaded by his mother (who feared Coligny's influence over her son) that the admiral sought his life. 'By God's death!' he exclaimed, 'let the admiral be slain, and not him only, but all the Huguenots, till not one remains that can give us trouble!' That night Catharine held a council, resolved with the Guises to get their blow in first, and appointed St Bartholomew's Day for carrying into effect a massacre of Huguenots—now for the first time fairly contemplated. A bell in the tower of St Germain l'Auxerrois, at half-past one, summoned the citizens to arms, and rumours that the king was murdered led to the general massacre. The king himself is popularly represented as having fired from his palace upon those that were fleeing past. The Prince of Condé and the king of Navarre went to mass, and were said to have saved their lives by conforming to the Catholic church. The country was at the same time summoned to similar slaughter; and there were found bloodthirsty fanatics enough to perpetrate the greatest horrors for several weeks in almost all the provinces. The numbers of the slain as given by various reporters vary too widely—from 2000 to 100,000—to be very credible; doubtless the smaller figures are more probable. It was reported at home and abroad that an attack on the king had been repulsed with great loss to the Huguenots. Queen Elizabeth as well as Philip II. sent congratulations to the French court; and the pope celebrated St Bartholomew's Day by a procession to the church of St Louis, a grand *Te Deum*, the striking of a medal, and the proclamation of a year of jubilee. But the crime was useless. The Huguenots had lost their chiefs, but, the first moment of stupor past, they took up arms with all the fury of despair; the royal troops were once more foiled in their attempts to take Rochelle; and Charles found himself forced to grant liberty of conscience. See books by White (1868) and Baumgarten (1882); histories of France by Martin, Duruy, Lavisse, &c.; Sully's *Memoirs*; and the works cited at HUGUENOTS and at CATHARINE DE' MEDICI.

Bartholomew Fair, held at West Smithfield, London, from 1133 till 1855, the charter for it having been granted by Henry I. to a monk named Rahere, who had been his jester, and had founded the priory of St Bartholomew (see below). The fair was held annually at the festival of St Bartholomew (August 24, old style); but in 1753, owing to the alteration of the calendar, it was for the first time proclaimed on 3d September, having in 1691 been curtailed from fourteen to four days. In the first centuries of its existence, Bartholomew Fair was one of the great annual markets of the nation, and the chief cloth-fair of the kingdom. Its articles of traffic were besides cloth stuffs, leather, pewter, and live-stock; while it was rendered attractive to the crowds that attended it by a variety of popular amusements. All manner of shows, exhibitions, theatrical booths, &c. thronged the fair; and tumblers, acrobats, stilt-walkers, mummers, mountebanks, and merry-andrews resorted to it in great numbers. In 1685 the fair was leased by the city to the sword-bearer, and thenceforth it began to decay as a place of trade. In 1840 the exhibitions were removed to Islington; in 1850 the last proclamation by the lord mayor took place, and in 1855 the once famous fair came to an end. See Professor H. Morley's *Memoirs of Bartholomew Fair* (1859) and Ben Jonson's play.

Bartholomew's (ST) HOSPITAL, Smithfield, London, was founded in 1123 by Rahere, the first prior of the Convent of Augustinian Canons, which he founded on Smithfield. The present church of St Bartholomew the Great was the choir of the priory church. An ancient chapel originally dedicated to the Holy Cross, partly rebuilt in 1823, is now the parish church of St Bartholomew the Less. After the dissolution of the monasteries, the hospital stood empty for eight years; but it received fresh charters in 1544 and in 1547, escaped the fire of 1666, and was rebuilt in 1729, with additions in 1865 and 1881. On the migration of Christ's Hospital (q.v.) part of that property was acquired for much needed extensions and reconstructions. There is an important medical school attached.

Bartizan, a small, overhanging, battlemented, parapet turret, projecting from the angles on the top of a tower. It was generally pierced with apertures for cross-bowmen, called *balistraria*. *The New English Dictionary* says that the word is a spurious 'modern antique', which had no existence in the times to which it is attributed. It was apparently first used by Sir Walter Scott, and was due to a misconception of a 17th-century illiterate Scots spelling, *bertisene*, for 'bertising'—i.e. *brētising*, or *bratticing*, a *brattice* being a battlemented parapet, originally of wood, and temporary.

Bartizan.

Bartlett, JOHN RUSSELL, American author,

was born at Providence, Rhode Island, U.S., 23d October 1805. For a time in a banking-house there, in 1837 he became a bookseller in New York, giving his leisure to history and ethnology. He assisted in founding the American Ethnological Society, and was secretary of the New York Historical Society. He was employed by the United States government in 1850-53 as a commissioner for determining the Mexican boundary-line, and in 1854 published an account of his explorations and adventures in that capacity. In 1855 he became Secretary of State of Rhode Island, and in 1861-62 he was its acting governor. He was the author of *The Progress of Ethnology*, a *Dictionary of Americanisms* (enlarged ed. 1878), *Primeval Man* (1868), *Bibliotheca Americana* (4 vols. 1865-70), &c. He died 28th May 1886.

Bartlett, WILLIAM HENRY, artist, born in London in 1809, was a pupil of Britton, the architect, who afterwards employed him to make drawings for his *Cathedral Antiquities* and *Picturesque Antiquities of English Cities*. Subsequently Bartlett visited the Continent, the Holy Land, and America several times, on each occasion enriching his portfolio with innumerable interesting scenes. No fewer than nineteen quarto volumes, containing about 1000 engravings from his sketches, and letterpress from his own pen and those of his fellow-travellers, Dr W. Beattie, N. P. Willis, and Miss Pardoe, were devoted to these countries. Bartlett died on the voyage from Malta to Marseilles, 13th September 1854.

Bar'toli, TADDEO, an Italian painter of the Siennese school (1362-1422).—DANIELO BARTOLI, a learned Jesuit, was born at Ferrara in 1608, and died rector of the Jesuit College at Rome in 1685. His chief work is the *Istoria della Compagnia di*

Gesù (1653-73).—PIETRO SANTO BARTOLI (sometimes called 'Perugino'), born 1635, died 1700. He was a painter after the manner of Poussin, and a skilful etcher.

Bartol'ni, LORENZO, a celebrated Italian sculptor, was born at Vernio, in Tuscany, in 1777, and came to Paris while still a young man. His chief patron was Napoleon, who in 1808 sent him to Carrara, to establish a school of sculpture. After the battle of Waterloo he repaired to Florence, where he died in 1850. Besides an immense number of busts, he produced several groups, the most celebrated of which are his 'Charity' and 'Hercules and Lycus.'

Bartolommeo, FRA (properly Baccio della Porta), one of the most distinguished masters of the Florentine school of painting, was born at Florence, in Tuscany, in 1469. His first teacher was Cosimo Roselli; but he owed his higher cultivation to the study of the works of Leonardo da Vinci. His subjects are mostly religious, and by far the greater part of his pieces belong to the later years of his life. He was a warm adherent of Savonarola, after whose tragical end he in 1500 assumed the monkish habit. The visit of the young Raphael to Florence in 1504 seems to have been instrumental in stimulating him to resume his art. He imparted to Raphael his knowledge of colouring, and acquired from him a more perfect knowledge of perspective. The two remained constant friends.—Bartolommeo on one occasion finishing certain of Raphael's unfinished works, Raphael performing a like kindness for him at another time. Bartolommeo died at Florence, 1517. The greater number of his works are to be seen at Florence, in the gallery of the Pitti Palace, but the Louvre possesses a fine 'Annunciation' by him. See books by Fiantz (Ratisbon, 1879), Leader Scott (Lond. 1880), Gruyer (Paris, 1886), and Knapp (Halle, 1903).

Bartolozzi, FRANCESCO, an eminent engraver, was born in Florence, September 21, 1727. After practising his art under Joseph Wagner at Venice, he went to Rome, where he executed his admired plates from the life of St Vitus. He was afterwards commissioned by Mr Dalton, librarian of George III., to engrave a series of drawings by Guercino, and was induced by the same patron to settle in England. Here Bartolozzi produced his exquisite line engravings of 'The Silence' and 'Clytie,' after Annibale Carracci, which entitle him to occupy the front rank in his profession. He also engraved numerous specimens of the works of his friend Giovanni Cipriani, of Michelangelo, Carlo Dolci, Sirano, and others, with equal truth and effect. He likewise enriched Alderman Boydell's Shakespeare Gallery with many fine engravings. In 1769, on the formation of the Royal Academy, Bartolozzi was nominated one of the original members, and executed, from a design by his friend Cipriani, the diploma, which is still in use, and ranks as one of his masterpieces. In 1802 he accepted a flattering invitation from the Prince Regent of Portugal, to take the superintendence of a school of engravers at Lisbon, whither he repaired three years afterwards in his seventy-eighth year, and there resided until his death, March 7, 1815. He was the grandfather of the celebrated actress, Madame Vestris. His prints are said to be more numerous than those of any other engraver, and include line engravings and stippled works, printed in brown and red.

Bartolus of Sassoferrato, jurist, was born at Sassoferrato in 1314, studied at Perugia and Bologna, was professor of Civil Law at Perugia from 1343, and died there in 1357. He wrote on procedure and on evidence, and commented on Justinian's code. See a study by Woolf (1913).

Barton, ANDREW, a famous Scottish naval commander of the time of James IV., was killed in an engagement with two English ships in the Downs, 2d August 1511.

Barton, BERNARD, Quaker poet, and friend of Lamb, was born in 1784. In 1809 he became clerk to a bank at Woodbridge, a post which he held till within two days of his death, 19th February 1849. His *Metrical Effusions* (1812) brought him into correspondence with Southey; whilst *Poems by an Amateur* (1818), *Poems* (1820), and several more volumes of verse increased his reputation. His devotional poems have an echo of George Herbert, and some of his lyrics are graceful; but he is on the whole less a poet than a versifier, easy and pleasant withal. Lamb's advice to him was, 'Keep to your bank, and your bank will keep you;' and by Lamb's advice he accepted the sum of £1200, raised by Quaker friends in 1824. See his *Poems and Letters* (1849), selected by his daughter, with memoir by her husband, E. Fitz-Gerald, and Lucas's *Bernard Barton and his Friends* (1894).

Barton, SIR EDMUND, the first Prime-minister of the Commonwealth of Australia, was born in Sydney in 1849. He entered the State Parliament in 1879, and was Speaker of the Assembly in 1883-87. In 1891 he took a leading part in the debates of the first Federal Convention, and was elected at the head of the poll for delegates to the convention of 1897-98. His continuous active work in the federation campaign (of which he was the Aaron rather than the Moses) resulted in his being given the task of forming the first Federal Cabinet, over which he presided till 1903, being then made senior puisne judge of the new High Court. The distinguishing qualities which raised him from the rank of politicians to be one of the few genuine Australian statesmen were a dignity and a sagacity for whose development the federation campaign gave full opportunity; while his very concentration on this great work kept him too far aloof from ordinary political life to be, as prime-minister, a satisfactory representative of Australian ideas on current affairs. Hence the naval agreement of 1902, for which he was responsible, was in Australian eyes a failure, and the judgeship came as a fitting close to his political career. He died 6th January 1920.

Barton, ELIZABETH, the nun or maid of Kent, was born in 1506, and about 1525, when a domestic servant, in the course of recovery from an illness, fell into nervous derangement and religious mania. When her illness left her, she still continued her trances and prophetic utterances, and Archbishop Warham sent two monks to examine her. One of these, Edward Bocking, seeing here a rare opportunity for reviving popular respect for the Catholic Church, instructed her in the controversial points and in the legends of the saints. Soon afterwards she became an inmate of the priory of St Sepulchre at Canterbury, but Bocking continued to be inspirer of her revelations. As soon as the divorce of Henry VIII. began to be discussed, the nun denounced it 'in the name and by the authority of God,' and threatened the king with death if he persisted in his purpose. Warham was convinced by her earnestness, Wolsey gave her an audience, Sir Thomas More listened to her more than once, and Bishop Fisher wept with joy over her revelations. The king's marriage to Anne Boleyn (1533) and subsequent immunity destroyed her credit. Under Cranmer she was 'put to the question,' and ultimately confessed that 'she never had visions in all her life, but all that she ever said was feigned of her own imagination only, to satisfy the minds of those which resorted to her, and to obtain worldly praise.' Put on trial for high treason, she was con-

demned and executed at Tyburn with Bocking and four other accomplices on the 20th of April 1534.

Barton Clay. See EOCENE.

Barton-upon-Humber, an ancient town of Lincolnshire, on the south side of the Humber, $7\frac{1}{2}$ miles SW. of Hull; pop. 6500.

Bartram, JOHN (1699-1777), the first American botanist of eminence, was born of Quaker stock near Derby, Pa., was botanist in America to George III., corresponded with Linnæus from his home near Philadelphia, established in the Schuylkill the first botanic garden in the colony, and wrote on his observations. His son William (1739-1823) was a botanist and ornithologist.

Bartsch, KARL (1832-88), born at Sprottau, in Silesia, became professor of German and Romance Philology at Heidelberg, edited the *Nibelungenlied*, the songs of Poland, translated Burns and Dante, wrote poems, and was editor of *Germania*.

Bartsia, a widespread genus of Scrophulariaceæ, close akin to eyebright. Most species, including the British pink-flowered roadside weed *B. odontites*, are partial parasites on grass-roots.

Baru, a fine woolly substance found at the base of the leaves of *Arenga saccharifera*, a sago-palm of the Indian Archipelago, is employed in caulking ships, in stuffing cushions, and the like.

Baruch ('the Blessed'), the son of Neriah, the faithful friend and secretary of the prophet Jeremiah. During the siege of Jerusalem by Nebuchadnezzar he was flung into prison along with the prophet, and found release only on the fall of the city (586 B.C.). He afterwards accompanied his master to Egypt, but of his after-life nothing certain is known. An apocryphal work in the Greek language has come down to us bearing his name, which contains in noble and glowing language a promise of future glory for Israel, and predicts the rebuilding of Jerusalem. There is usually appended to it, as Chapter vi., a letter of the prophet Jeremiah to the exiles in Babylon. There is also an apocalypse, credited to Baruch, extant in a Syriac translation from a Greek version of the original Hebrew.

Barwood. See CAMWOOD.

Bary, HEINRICH ANTON DE (1831-88), born at Frankfort, became the supreme authority on algæ and fungi, was professor of botany at Freiburg, Halle, and Strasburg, and wrote important treatises.

Barye, ANTOINE LOUIS, a French sculptor, distinguished mainly for his bronze statues of animals and animal-groups, was born at Paris, 24th September 1795, and was at first an engraver and metal-worker. His famous bronze of a lion struggling with a snake secured for him the cross of the Legion of Honour. He died 27th June 1875.

Baryta, or BARYTES, or Oxide of Barium (q.v.)—symbol BaO—is the earth present in the minerals *witherite* (carbonate of barium) and *heavy spar* (sulphate of barium). It may be prepared in several ways: (1) By acting upon the carbonate of baryta, BaCO₃, by nitric acid, HNO₃, which causes the disengagement of the carbonic acid, CO₂, and the nitric acid combining with the baryta forms the nitrate of barium, Ba2NO₃. On evaporating the latter substance to dryness, and igniting the residue, the nitric acid volatilises, and leaves the baryta, BaO. (2) Another mode of preparing the same substance is to act upon a solution of sulphide of barium, BaS, by the black oxide of copper, CuO, when an interchange of elements occurs, the sulphur uniting with the copper, producing sulphide of copper, Cu₂S, and the oxygen with the barium, forming baryta, BaO, which remains dissolved in the water, and, on evaporation, deposits crystals in the hydrated condition, BaH₂O₂.8H₂O. Baryta belongs to the group of

alkaline earths, and has the property of acting like an Alkali (q.v.) on colouring matters. It has a very harsh taste, is highly caustic, and is very poisonous. The presence of carbonic acid gas may be detected by exposing a solution of baryta to the air, when carbonic acid combines with the baryta and forms a film of white carbonate of barium, BaCO_3 . Baryta exposed to air or oxygen absorbs oxygen, forming peroxide of barium. On this being heated, oxygen is liberated and baryta again produced. Till about 1870 it was found impossible to procure Oxygen (q.v.) by this simple method, as the action became weak when the process was repeated. But the brothers Brin discovered that by carefully removing all carbonic acid gas and water from the air before passing it over the

Crystal of Sulphate of Baryta.

barium, the difficulty is removed, and oxygen is thus economically produced. The *sulphate of baryta*, BaSO_4 , otherwise called *ponderous* or *heavy spar*, is found in fissures or cracks in other rocks. It is crystalline, and is sometimes found pure and white, but generally presents a flesh-red colour, from the red oxide of iron (rust) incorporated in it. The rust can be got quit of by reducing the sulphate of baryta to a fine powder under rollers or travelling-wheels, and subjecting the pulverised material to the action of dilute sulphuric acid, which dissolves the oxide of iron, and leaves the sulphate of baryta as a white dense powder. The principal use of *heavy spar* is as a pigment under the name of *permanent white*; but having little opacity, it cannot be employed by itself, but only when mixed with ordinary white-lead. When added to the latter, however, it must be regarded as an adulteration, for the little opacity it possesses renders it of service only as an increaser of the bulk of the white-lead. Several mixtures of sulphate of baryta and white-lead are manufactured, and are known in commerce. *Venice White* contains 1 part sulphate of baryta and 1 part white-lead. *Hamburg White* contains 2 parts sulphate of baryta and 1 part white-lead. *Dutch White* contains 3 parts sulphate of baryta and 1 part white-lead. The native sulphate of baryta has been employed by the celebrated potter Wedgwood in the manufacture of jasper ware, and for the formation of white figures, &c. on coloured jars and vessels. The *carbonate of baryta* found native as *witherite*, and the *nitrate of baryta*, have been previously referred to in this article and that on BARIUM.

Baryton (Viola di Bardone), an old chamber-instrument, somewhat like the viol di gamba in tone: had a broader finger-board, with six or seven gut-strings, while under the neck there were from nine to twenty-four strings of brass wire, which were pinched with the point of the thumb, to produce a sound, while the gut-strings were acted on by a bow. For the baryton voice, see BARITONE.

Bas, or **BATZ**, a small island in the English Channel, belonging to France, and situated off the north coast of the department of Finistère. Its length is about $2\frac{1}{2}$ miles, and its breadth about $1\frac{1}{2}$ mile. It has three villages; a fine haven, that of Kernoc, and a lighthouse. Pop. about 1200, whose chief occupation is fishing.

Basalt. Basalt-rocks are of igneous origin, and are composed essentially of plagioclase

felspar, augite, olivine, and generally magnetite or titaniferous iron. They show all varieties of texture, from smooth-compact up to coarsely crystalline, and vary in colour from pale blue up to dark grayish blue, brownish, and black. The vitreous varieties are *Tachylite* and *Hyalomelane*; compact or crypto-crystalline varieties are termed *Basalt*; fine-grained kinds are sometimes called *Anamesite*; while *Dolerite* is the name occasionally given to the more coarsely crystalline kinds. Seen under the microscope, the compact and fine-grained basalt-rocks often show a certain proportion of glassy or devitrified matter lying between the various crystalline minerals of which the rock is chiefly composed. Basalt-rocks are often vesicular and amygdaloidal. Sometimes they occur as lava-flows, at other times they appear as intrusive sheets, dikes, and masses. They are of common occurrence in Britain, more especially in Scotland. As examples of lava-form basalt-rocks may be cited those of Mull, Staffa, and other islands of the Inner Hebrides. Similar lava-form basalt-rocks are well developed in Antrim. Intrusive basalt-rocks are abundant in Central Scotland—Salisbury Craigs, Edinburgh Castle Rock, Dalmahoy Craigs, Abbey Craig, &c. are examples.

The older basalt-rocks have frequently undergone some changes, owing to the chemical action of percolating water. Such altered rocks have often a dull greenish colour, the greenish tinge being due to the conversion of the augite and olivine into green serpentinous and chloritic products. Such more or less altered varieties of basalt-rock sometimes acquire special names—the finer-grained kinds being called *melaphyre*, and the coarser-grained ones *diabase*. When basalt-rocks have been intruded amongst coals or black shales, they often become gray, white, or yellow in colour, and assume a dull earthy appearance. This is the so-called *white-trap*.

There are volcanic masses of Tertiary age which occur in such regions as the Thuringer Wald, Erzgebirge, the Eifel, Italy, &c. which closely resemble basalt-rocks. In these rocks, however, the minerals nepheline and leucite play the part of plagioclase felspar. The rocks, therefore, are known as *nepheline-basalt* and *leucite-basalt*, to distinguish them from ordinary basalt, or, as it is sometimes called, *plagioclase-basalt*. The latter ranges in age from Lower Carboniferous times at least, up to the present; the former are not as yet known from any older stage than the Tertiary.

Basalt-rocks, especially the compact varieties, often assume a columnar structure. This structure, however, is not confined to basalt-rocks. The columns vary in the number of their angles from 3 to 12, but they have most commonly from 5 to 7 sides. In some cases they are more or less perfectly hexagonal. They are generally divided transversely by joints at tolerably equal distances, and in the case of the more perfectly columnar rocks, these joints often show at each articulation a cup and ball socket. The columns are always arranged at right angles to the planes of cooling, so that in the case of an approximately horizontal bed or sheet the columns are vertical, while in the case of a vertical dike, they are horizontal. Various explanations of this remarkable structure have been advocated, none of which can be said to be perfectly satisfactory. The general belief, however, is that they are the result of contraction upon cooling. Two of the best known and finest examples of columnar structure in basalt-rocks are Fingal's Cave in the island of Staffa (q.v.), on the west coast of Scotland, and the Giants' Causeway (q.v.), on the north coast of Ireland.

Basalt-rocks, owing to their toughness and

hardness, and to the fact that their mineral ingredients yield unequally, are much employed for causeway-stones and 'road-metal.'

Base, in Chemistry, is a term applied to a compound body, generally consisting of a metal united with oxygen. Thus, the metal potassium, K, when it combines with oxygen, O, forms the oxide K_2O , which unites with water, yielding the base potash, or caustic potash, KOH; and similarly lead, Pb, and oxygen, yield the base oxide of lead, or litharge, PbO . A distinguishing feature of a base is that it is capable of entering into double decomposition with an acid, more or less neutralising its acid properties, and forming a Salt (q.v.) and water. Thus, the base potash combines with sulphuric acid to form the salt, sulphate of potash, and water, as represented by the equation:

So also potash and nitric acid, HNO_3 , yield the salt nitrate of potassium, or nitre, KNO_3 . The metal half of a base may be a compound radicle which, for the time, plays the part of a simple substance. Thus, in ammonium hydroxide, NH_4OH , the compound radicle ammonium, NH_4 , behaves as if it were a metal similar to potassium; when it reacts with an acid, a salt is formed with the NH_4 group still intact.

The bases potash, KOH, soda, NaOH, ammonia, NH_4OH , baryta, BaO, strontia, SiO , lime, CaO, and magnesia, MgO , are more or less soluble in water; whilst the oxide of iron or rust, Fe_2O_3 , and the red oxide of mercury, HgO , are insoluble in water, but soluble in acids. There are organic bases as well as inorganic bases. The more important organic bases are the Amines, Alkaloids, and Amides. They can unite with an acid to form a salt. Thus, aniline unites with hydrochloric acid to form aniline hydrochloride, which is a salt.

Base, in Architecture, the foot or lower member of a pillar, on which the shaft rests. See COLUMN.

Base, in Heraldry, the lower portion of the shield. Any figure placed on it is said to be in base. A small portion of the base of a shield parted off by a horizontal line is sometimes called a base.

Base-ball, the American national game, takes its name from the 'bases' arranged on, but is essentially an evolution from the old English school boy pastime of Rounders; but unlike the boyish pastime from which it had its origin, it requires mainly qualities to excel in it. In base-ball, as in rounders, the players use a bat and a ball, and run around bases, but there all resemblance between the two games ceases. As the game of base-ball is now played, it is full of excitement, and is engaged in with equal zest by schoolboys on an open field, and by trained professional experts on inclosed grounds, presenting to the latter full scope for the exercise of those mental and physical attributes which mark the intelligent and practised athlete.

Cricket and base-ball are coupled in Miss Austen's *Northanger Abbey*, which was written about 1798. In the States, the Knickerbocker Club was founded at New York in 1845, the Excelsior Club at Brooklyn in 1860; but it was not till 1865 that the game became universal.

The theory of base-ball may be briefly summed up as follows: A space of ground, in the form of a diamond, 90 feet square, is marked out on a level field of three or four acres in extent. Bases are

placed on or within each angle of the diamond, and are called respectively *home, first, second, and third bases*. Each team consists of nine players, its members taking the bat in regular succession. The man at the bat is termed the batsman, or striker, and his side may be regarded as the defensive force; the field side is the attacking party, and is disposed

Fig. 1.—Diagram of Base-ball Ground.

as follows: The pitcher, near the centre of the diamond; the catcher, behind the home base; the first baseman, near the first base. To the right of the catcher; the second and third basemen, near the second and third bases; and about midway between these, the short-stop; with out-fielders at right, centre, and left fields, more or less in line with first, second, and third bases respectively.

When play begins, the pitcher delivers the ball, a fair ball being one that passes over the home base, and not lower than the batsman's knee nor higher than his shoulder. Should the batsman fail to strike at a fair ball, or strike at any ball, fair or otherwise, and fail to hit it, or make a foul hit—a hit falling outside the lines of the diamond between the home and first and third bases or continuations of them marked in white on the grass—a 'strike' is called, and after three strikes, the third not being called on a foul hit, the batsman is obliged to run or is put out; on the other hand, four unfair balls delivered by the pitcher entitle the batsman to a base. The batsman endeavours to send the ball out of the reach of the fielders, and far enough out in the field to enable him to make the round of the four bases without being put out, in which case he scores a run. Each base, however, is a resting-place, and he may stop on any base until either he sees an opportunity to steal to the next, or a succeeding batsman sends the ball far enough to enable him to run with safety—for, except when occupying a base, the runner touched with the ball by a fielder is out. All three bases may thus be occupied at once; but when the next batsman becomes a base-runner, the runner on first base must pass on to

second base, which must be vacated to receive him, otherwise he is put out. This rule and another, obliging runners to return and touch the base last occupied when a striker's ball is caught before touching the ground, afford scope for 'double-play,' as a fielder may catch the striker out, and then throw the ball to a base-keeper before another of the same side who is running bases can return. A batsman can only run on a fair hit, but he may be caught out on a foul hit just as on a fair, and if, after a fair hit or three strikes, the ball is fielded to first base before he arrives there, he is out. The first striker is followed by others in rotation at the bat, until three of the batting side are put out, when the field side take their turn at the bat. This goes on until nine equal innings have been played, and then the side scoring the most runs wins the game. It will be readily seen that the theory of the game is very simple, and it is this simplicity of construction which forms one of its chief attractions; and yet to excel in the playing of all the points of the game requires not only the possession of the physical attributes of endurance, agility, and strength, together with good throwing and running powers, and plenty of courage, pluck, and nerve, but also the mental powers of quick perception, thorough control of temper, and the presence of mind to act promptly in critical emergencies of the game.

The weight of the ball used is 5 to 5½ ounces, its circumference 9 to 9½ inches; and it is much more elastic than a cricket ball. The bat is round, not more than 2½ inches in diameter at the thickest part, and must not exceed 42 inches in length.

Fig. 2.—Base-ball Bat.

The ball is delivered by the pitcher with great swiftness, an underhand throw being allowable and very generally employed; and this high speed attained enables a skilful player to send the ball with such a twist or *curve* as will deceive the batsman, and make him think a fair ball bad and an unfair ball good. This effect is obtained by the resistance offered to the ball by the air, and a rotary motion of the ball on its own axis, supplied by the pitcher; and the direction of the curve is determined by the manner in which the ball is delivered from his hand. Curved pitching has been brought to considerable perfection of late years, but a certain want of accuracy makes it advisable for the catcher, when playing close behind the batsman, to wear a strong wire mask, and has produced a rule entitling a batsman who is struck by the ball to take his first base therefor. Prior to 1887, there were no less than four special professional codes of playing rules in use, besides those governing amateurs; but since the beginning of that year, the game has been played under a set of 'National Rules,' agreed to by all players.

The great popularity of base-ball in America has led to the establishment of regular stock-companies, employing a large amount of capital in the business of 'running' professional club teams, whose games are witnessed by many thousands of spectators. What with the college clubs and the amateur organisations of the country, it is safe to say that hundreds of thousands of young men participate in base-ball games during each season, from April to October. Outside of the United States, the game has become popular in Canada, Australia, and Japan; and in the 20th century it has made some advance in England. See books by Chadwick.

Base-bed. See PORTLAND (ISLE OF).

Base-court (Fr. *basse cour*, 'low court'), the lower or outer court of a castle, with offices.

Basedow, JOHANN BERNHARD, educationist, was born 11th September 1723, at Hamburg, where his father was a peruke-maker. He studied at the Johanneum there, and at the university of Leipzig. After tutoring for a time in Holstein, he was in the year 1753 appointed professor of moral philosophy and belles-lettres in an academy at Sorø in Denmark. In 1761 he was removed to the gymnasium at Altona, where, on account of heterodox opinions in theology, he was soon forbidden to teach. Jean-Jacques Rousseau's *Emile* awakened in him, in 1762, the thought of improving the method of education, and of reducing to practice Rousseau's maxims and those of Comenius. Contributions from princes and private persons, amounting to 15,000 thalers (about £2200), covered the cost of his *Elementarwerk*, which was illustrated with 100 copperplates, and was intended to bring the minds of children into contact with realities, and not mere words. As a model school on this method, he established in 1774 the *Philanthropin* at Dessau; but his restlessness of disposition, and his quarrels with his colleagues, led to his withdrawal, and it was finally shut up in 1793. Basedow died at Magdeburg, July 25, 1790. His influence on the public mind of his age, particularly in Germany, was very great, and his numerous works powerfully awakened attention and interest in the much-neglected subject of education. See his *Life* by Meyer (2 vols. Hamburg, 1792).

Bas'el (Fr. *Bâle*; older Fr. *Basle*), a city and canton of Switzerland. The canton was divided in 1833 into two independent half-cantons, called *Basel-city* and *Basel-country*. The urban half-canton consists only of the city, with its precincts, and three villages on the right bank of the Rhine; the remainder forms the half-canton of Basel-country. The canton of Basel borders on Alsace-Lorraine and Baden, and has an area of 177 sq. m.—but little larger than the county of Rutland. Lying on the northern slope of the Jura, it is a country of hills and valleys. The mountains attain an elevation of over 3400 feet. The chief rivers of Basel are the Rhine and its tributaries, the Birz and Ergolz. The soil is fertile and well cultivated. The climate, except in elevated situations, is very mild. The inhabitants are chiefly employed in agriculture, the cultivation of fruit-trees and of the vine, cattle-husbandry, fishing, salt-works, the spinning of waste silk, the manufacture of silk ribbons, chemicals, colours and dyes.

The city of Basel arose out of a Roman fortified post, known as *Basilia* after an imperial visit in 374. From an early period it was the seat of a bishop, and in the beginning of the 10th century the Emperor Henry I. rebuilt the town, which then became a place of importance, and after 1032 formed part of the German empire. The centuries that follow are marked by a steady extension of the authority of the burghers, whose repeated efforts to break the power of the bishop and the nobles fill up the history of the period. Involved in many feuds with the House of Hapsburg, Basel formally joined the Swiss Confederacy in 1501. From 1519 onwards, Luther's writings were printed here; and at the end of twenty years from that time, the reformed doctrine had become generally prevalent. After the union with Switzerland, the triumph of the burgher party became also more complete; but the peace of the city was often disturbed by strife caused by the assertion of undue authority by the magistrates. All parties in the city, however, combined against the country district; and persons

belonging to the city were appointed to all offices, civil and ecclesiastical. Under the impulse communicated by the French Revolution, equality of rights was conceded in 1798; but in 1814 the new constitution made the city again supreme. After unsuccessful attempts to obtain redress of grievances by petition, civil war broke out in 1831, which did not cease till the troops of the Swiss Confederation took possession of the canton, and the diet recognised the separation of the city and the country district in 1833. The constitutions of the two half-cantons are in most respects similar, and are framed on the basis of the old constitution, modified in accordance with the principle of universal suffrage. In 1920 the half-canton of Basel-city contained 140,112 inhabitants, and Basel-country 82,033—in both cases more than two-thirds being Protestants. The capital of Basel-country is Liestal. Both Roman Catholic and Protestant clergy are paid by the state, and the parishes of the Reformed Church choose their own pastors.

The city of Basel was relatively much more important in the middle ages than now, and this though its population has grown from 29,555 in 1850 to 135,000 in 1920, and though in proportion to its population it is one of the wealthiest cities of Europe. In the 14th century, the number of its inhabitants was greatly reduced by the plague, or 'Black Death' (q. v.), which raged in it with terrible severity, and is sometimes mentioned as the 'death of Basel.' The town is well built and clean, but its appearance does not proclaim it the wealthiest city in Switzerland, as it is. The Rhine, here spanned by three bridges, 200 yards long, divides the city into two parts—Great Basel on the south side, and Little Basel on the north. The minster, a cathedral till 1528, was founded by the Emperor Henry II. in 1010, but not completed till 1500. It was restored in 1852–56, and has two conspicuous towers, 218 feet high. Other buildings are the town-hall (1508); the university, founded in 1460; a museum, in which there are thirty-two pictures by the younger Holbein, who lived thirteen years in Basel, though a native he was not; and a public university library of 160,000 volumes and 4000 manuscripts. During the Reformation, the university was a central point of spiritual life, and it has numbered among its professors men of great eminence in learning and science, including Erasmus and Eccolampadius, both of whom died here, and the mathematicians Euler and Bernoulli, who were natives of Basel. It has now some 100 professors and lecturers, and about 1000 students.—At Basel was concluded on 5th April and 22d July 1795 a treaty between the French Republic, Prussia, and Spain, Prussia withdrawing from the coalition against France.

Basel, COUNCIL OF (1431–43), the last of the three great reforming councils of the 15th century, was summoned by Pope Martin V., and opened under his successor Eugenius IV., 23d July 1431. Its first session was held at Basel on 14th December 1431. Instead of the method followed at Constance, where the members deliberated and voted by nations, the council was divided into four departments, each with its own organisation, and each investigating a special class of subjects, its decision and reasons being communicated to the others. If three agreed in their opinions, the matter was brought before the whole council for final discussion and judgment. In this way the influence and intrigues of the Italian bishops were neutralised. The council addressed itself to the reconciliation of the Hussites, and to the reform of abuses in the church itself. But the first attempt to conciliate the Hussites was met with resistance by the pope, who not only refused his sanction, but empowered the cardinal legate to dissolve

the council. The council strongly repelled the pope's pretension of right to dissolve it, and proceeded with its business. His injunctions that it should remove to Italy were equally disregarded. It renewed the decree of the Council of Constance, asserting the right of a General Council to exercise authority over the pope himself, and on his persevering to issue bulls for its dissolution, caused a formal process to be commenced against him, and cited him to appear at its bar. It assumed the papal powers, and exercised them in France and Germany, where its authority was acknowledged. It concluded a peace, in name of the church, with the Calixtines, the most powerful section of the Hussites, by the Prague Compact of 20th November 1433, granting them the use of the cup in the Lord's Supper. At length, Eugenius IV., being hard pressed by insurrections in the States of the Church, and afraid of losing his whole influence in France and Germany, solemnly ratified all its decrees, by a bull dated 15th December 1433. Desirous, however, of limiting the papal prerogatives, the council restricted the power of granting interdicts, abolished *annats* and other grievous exactions, and prohibited the bestowal of reversions to ecclesiastical offices. It also appointed punishments for certain immoralities in the clergy, and prohibited Festivals of Fools, and all the indecorous proceedings which had been commonly practised in churches at Christmas; and it adopted decrees concerning the election of popes, and for the regulation of the College of Cardinals.

At this time, a prospect was opened up of the union of the distressed Greeks with the Church of Rome, and a council was proposed to this end. The Basel fathers refused to meet in Ferrara, and having again cited the pope to its bar, not only, on his failing to appear, declared him contumacious, but on his opening an opposition council at Ferrara, went so far as, on January 24, 1438, to decree his suspension from the functions of his office. His party, however, was so strong that this decree could not be carried into effect; and the cardinal legate, with the greater number of the Italians, left Basel, and went over to his side. All the more resolutely did Cardinal Louis Allemand, Archbishop of Arles, a man of high courage and eloquence, now guide the proceedings of the council, which on May 16, 1439, declared the pope a heretic, for his obstinate disobedience to its decrees; and in the following session, formally deposed him for simony, perjury, and other offences. On November 5, 1439, it elected Duke Amadeus of Savoy to be pope, who styled himself Felix V., but was recognised only by a few princes, cities, and universities. France and Germany accepted the reforming decrees of the council, but remained neutral in the question regarding the popedom. The friendship of the Emperor Frederick III. strengthened the party of Eugenius; and the council gradually melted away, and its members, after three years of inactivity, held its last session at Basel on May 16, 1443, and removed its seat to Lausanne. Here a few prelates still remained together under the presidency of Cardinal Allemand, till in 1449, after the death of Eugenius, and the resignation of the antipope Felix, a compromise was effected, by which the fathers directed the church to obey the new pope, Nicholas V., who in return confirmed the acts of the council. Thus ended the last attempt to reform the church from within, and on its old basis. The Basel reforming decrees are contained in no Roman Catholic collection, and are held to be invalid by the canonists of Rome; yet they are of authority in canon law in France and Germany, although their application has been modified by recent concordats. See vol. vii. of Hefele's *Konziengeschichte* (Freiburg, 1869).

Base-line. See ORDNANCE SURVEY.

Basella, a tropical genus of Chenopodiaceae (q.v.). *B. alba* and *B. rubra* are known in Britain as stove biennials. They are plants with twining stems, in common use as pot-herbs in the East Indies, and cultivated in China; also sometimes in France as a substitute for spinach. *B. rubra* yields a rich purple dye. The great fleshy root of *B. tuberosa*, a South American twiner, is edible.

Base of Operations, in warfare, is the place, or the sum of the places, from which an army in the field obtains, or can obtain, its necessary supplies of all kinds, and its reinforcements. It is common to talk of ultimate base, intermediate base, advanced base, temporary base; these adjectives explain themselves. In a British campaign abroad, we have our islands as ultimate base. This, and the communications to it, being unassailable by the enemy as long as we have command of the sea, affords us the valuable advantage of fighting 'with limited liability.' A broad base is of very great value, as its possession affords a commander a wide freedom for his strategical movements. A narrow base, with a single route leading from it, seriously hampers strategical freedom, for the commander is compelled to cover continuously the single route. Its loss would paralyse the army. A force operating temporarily without a base—that is, carrying all its requirements with it—is called a flying column.

Bashahr, one of the Punjab Hill-states, on the lower slopes of the Himalayas, traversed from east to west by the Sutlej; area, 3820 sq. m. The raja and upper classes in the southern parts are Rajputs, and the people generally are of Hindu race, but their observance of Hinduism is very partial. The raja pays tribute to the British government, for which he is required to raise troops in time of war, and by which his sentences of death must be confirmed. Pop. 100,000.

Ba'shan, a country of south-west Syria, east of the Jordan, is a volcanic plateau rising in the Jebel-ed-Druz to 8000 feet, extends 60 miles north and south, and about 40 miles east and west. Josephus mentions four provinces: Gaulonitis, a western division, the territory of Golan, the ancient Hebrew city of refuge; Trachonitis (ancient Argob), to the north-east, the remarkable volcanic region of the Lejah; Auranitis, comprising the fertile Hauran plain; and Batanea, to the east, the seat of the Druses (q.v.). In the time of Abraham, Bashan was occupied by the Rephaim ('giants'). Ashteroth-Karnaim, identified with Busrah; Edrei, identified with Derat; and Kenath, with Kunawat, were its chief cities; the first two being the residence of its kings during the Amorite dynasty. The last of its Amorite rulers was Og, who with all his sons was killed by the Israelites under Moses, at the battle of Edrei, when the half-tribe of Manasseh settled in the land. The men of Bashan were remarkable for their stature, its soil and pastures for their richness, and its sheep and oxen for their size and fatness. Bashan is covered with the ruins of the so-called 'giant cities,' which, however, according to Conder, date only from the early Christian centuries; their roofs, doors, stairs, and windows are of stone, some of them as perfect as when first built. Bashan belonged to the tetrarchy of Philip, and afterwards to that of Agrippa II. See works by Porter, Conder, De Vogüé, and Wright.

Bashaw. See PASHA.

Bashi, or BATANES ISLANDS, are politically a dependency of the Philippine Islands (q.v.), physically a link in the vast archipelago extending from Formosa to Sumatra. There are three larger and many smaller islets. Area, 127 sq. m.; pop. 10,000.

Bashi-bazouks', a name once given to irregular troops in the pay of the sultan. They were brave, but wild and turbulent infantry or cavalry.

Bashkirs, a Turko-Tatar people of Perm, Orenburg, Viatka, and Ufa. Sunnite Mohammedans and partly nomadic, they number three-quarters of a million. A Tatar-Bashkir republic (Samara, Orenburg, and Ufa) was formed after the Russian revolution, and a Bashkir republic (parts of Orenburg and Ufa; capital, Sterlitamak) was set up by the Moscow government in 1919-20.

Bashkirtseff, MARIE, artist and diarist, was born of noble family at Poltava in the Ukraine, 11th November 1860, and died of consumption, on the 31st October 1884, at Paris, where she had become famous as a brilliant member of society, a woman of marvellous accomplishments, and a painter of very high promise. Her *Journal* (trans. from the French by Miss Blind, 1890) is a startling, sincere, vivid, and pathetic record of a life in which strenuous labour was but an element in a whirl of the keenest joys and griefs, the triumphs and disappointments of a nature singularly impressionable and sensitive, as well as vain and ambitious. Her *Letters* (Eng. trans. by Miss Serrano, 1891) have also been published, and a *Nouvel Journal inédit* (1901).

Basic Slag, Basic Steel. See IRON AND STEEL, SLAGS, MANURE.

Basil, surnamed THE GREAT, and called St Basil, one of the most eminent and eloquent of the Greek Fathers, was born about 329 at Cæsarea, in Cappadocia; studied under the heathen philosophers at Athens, where he began a lifelong friendship with Gregory Nazianzen, his later letters to whom are full of information about contemporary times; became an advocate in his native city, but afterwards founded a monastic society; was ordained a presbyter in 364; and succeeded Eusebius as Bishop of Cæsarea in 370, in which office he continued till his death in 379. He resolutely resisted invitations to the court of Julian the Apostate, with whom he had contracted an intimacy as a fellow-student at Athens, and displayed great constancy when the Emperor Valens began to persecute him on account of his opposition to Arianism. He was engaged in most of the controversies of his time, but conducted controversy in a gentle and generous manner. His rules of monastic life are still followed in the Greek and other oriental churches, in which he is highly honoured as one of the greatest of saints. In the Roman Catholic Church, also, they are followed in a few convents, styled of the order of *Basilians*. He is also the author of a revised liturgy, still in use in the East, known as the *Liturgy of the Holy Basil*; but his chief services to the church were in defence of the Nicene creed against the Arians. The best editions of his works are those of the Benedictines (3 vols. Par. 1739), and that of Migne in 4 vols. (29-32) of his *Patrologia Græco-Latina* (Par. 1866); but the authenticity of many of his moral and ascetic pieces is doubtful. His anniversary is celebrated, in the Greek Church, on the 1st of January—the day of his death; in the Latin Church, on the 14th of June—the day of his ordination. See a book by E. F. Morison (1912).

Basil I., 'the Macedonian,' Byzantine emperor 867-886, came to Constantinople when still a young man, and was in 861 appointed chamberlain to the Emperor Michael III. After the assassination of this monarch in 867, Basil became sole emperor of the East. His first care was to heal the wounds of the state; and, as the prodigality of Michael had exhausted the public treasury, he took means to refill it by a wise economy. His valour made

him the terror of the Saracens, from whom he reconquered Asia Minor. He sent missionaries to the Russians of Kiev, who, from that time, began to embrace Christianity and acknowledge the authority of the Greek Church. He died in 886. Basil founded a pure despotism, and, as part of a system of centralisation, placed eunuchs at the head of the departments of state, who, as they could not found a dynasty, would be less tempted to rebellion. He also introduced the principle of legitimacy in succession, and initiated the custom of having his descendants born in the 'porphyry chamber,' so that the title Porphyrogenitus might be equivalent to Prince Royal. He left his dynasty so secure that it reigned in greater or less prosperity for 200 years.

Bas'il (*Ocymum*), a mainly tropical or subtropical genus of Labiatae (q.v.), characterised by a pleasant aromatic smell and taste, and reckoned among *sweet herbs*.—**SWEET BASIL** (*O. basilicum*) is an Indian annual which has long been cultivated in Europe for seasoning purposes. It was formerly also of some medicinal repute, and is doubtless a gentle carminative. Many superstitions attach to it. The ancients asserted that the plant had the power of propagating scorpions, even in the brains of men. The belief that it thrives especially on the brains of murdered men occurs in the *Decameron*, and is rendered familiar by Holman Hunt's picture.—**BUSH BASIL** (*O. minimum*) is of similar origin and uses. The seed of both species should be sown on a hotbed, and subsequently planted out.—**WILD BASIL** and **BASIL THYME** are species of Calamint (q.v.).—**Basil Vinegar** is made like Mint Vinegar, by steeping the leaves in vinegar. Basil is said to be protective against mosquitoes and malaria.

Basilica (Gr. *basilikē*, from *basileus*, 'king'), a market-place, exchange, and place of meeting. According to Sir A. Evans, the royal villa to the N.E. of Knossos was the prototype of the house of the Athenian archon basileus, and thereby of the basilica. The first basilica we hear of at Rome is the Basilica Porcia in 182 B.C. Till the time of Constantine, they were constructed in great numbers. Some twenty are known to have existed in Rome, and latterly every provincial town, even those of small extent, had each its basilica, as that of

court of justice. It has generally been supposed that the prætor's apse and seat were at one end of the central division, immediately opposite the entrance at the other, but this is now disputed (see *APSE*). The form of the basilica was not always

Fig. 2.—Ground-plan of Basilica of St Paul, Rome.

the same. Sometimes there was no hemicycle or apse, as in the basilica at Pompeii, in which case the tribunal was cut off from the nave; sometimes there were two, as in the basilica of Trajan. Again, the basilica was sometimes entered, not from the end, but from the sides, where the transepts of a modern church are situated; and at the end opposite that in which the tribunal was placed there was often a row of small chambers, the uses of which do not seem to be very accurately ascertained, and probably were not invariable. In the basilica of Pompeii there was an outside stair which led to the upper gallery, which in this case passed entirely round the building. The gallery was the place to which loiterers usually resorted for the purpose of watching the business proceedings below; and the one half of it is said to have been devoted to men, the other to women. The large churches of the Christians, erected after the religion was adopted in the empire, had a considerable general resemblance to the Roman basilica, and those churches have always gone by the name of basilicas. But Professor Baldwin Brown disputes this, and maintains that the early church was rather an enlarged schola (or guild-hall) than a basilica. Probably the professor's view is right as regards the churches of the first three centuries, but when thereafter the congregations largely increased, the churches were enlarged after the idea of the basilica.

Fig. 2 shows the usual plan of these Christian basilicas—a large oblong space, divided into central nave and side aisles by two or four rows of columns, preceded at the entrance end by a porch or narthex (to which alone the neophytes and penitents were admitted), and terminated at the opposite end with a cross wall, containing in the centre a great triumphal arch which led into the

Fig. 1.—Section of Trajan's Basilica, Rome.

Pompeii, which is now the most perfect example, still testifies. The earliest basilicas were entirely open to the external air, and were surrounded with a portico under which shelter could be obtained; but in course of time the central space was also covered in. The basilica then became an oblong hall, divided by rows of columns into a wide central nave and lower side aisles, over which there was frequently a gallery. The central space was lighted by windows in the upper part of its side walls (like the clerestory of a church). Amongst its other uses, the basilica contained an apse, in which the prætor conducted his

transept or sanctuary reserved for the clergy, out of which opened the apse, with the bishop's throne in the centre, raised some steps above the floor, and the seats of the presbyters and deacons on each side. Between the bishop and the people stood the altar, generally raised over the crypt which contained the body of the saint to whom the building was dedicated. The narthex was usually preceded by an open court with colonnade and fountain. Attached to this was the Baptistry (q.v.).

A large number of basilicas still exist in Rome, dating from the 5th and 6th centuries up to the 10th. Churches in France and England were sometimes honoured by the pope's permission to assume the title of basilica.

Basilica, a code of laws of the Byzantine empire, the compilation of which was begun in the reign of the Emperor Basil I., the Macedonian, completed by his son Leo, the Philosopher, and first published in 60 books in 887. Constantine Porphyrogenitus, the son of Leo, prepared an official commentary to it, as well as a revised edition of the work itself. It was very much an adaptation of the code of Justinian to altered circumstances, and is of great value for the interpretation of the *Corpus Juris*. Apparently the code was at first called *The Revision of the Ancient Laws*, next *Herikontabiblos*, from its division into sixty books; and finally, before the end of the tenth century, it came to be called by its present name—apparently an elliptical form of *basilika nomima* ('imperial constitutions'). Some have supposed, however, that the name was derived from that of the Emperor Basil, as those legal forms instituted by his son were originally initiated by him. There are editions by Fabrot (7 vols. fol. Paris, 1647) and Heimbach (6 vols. Leip. 1833-70; with supplements by Zacharia, Ferrini, and Mercati, 1846-97).

Basilicata, one of the 'compartimenti' of the kingdom of Italy, touching the Gulf of Taranto. It exactly corresponds with the official 'province' of Potenza (q.v.), the province being the administrative unit, the compartimento usually a conventional grouping of several provinces.

Basilicon (Gr., 'royal,' or 'of great virtue'), a name given to four kinds of ointment, all of which contain the substances yellow wax, resin, and olive oil, along with other ingredients. Basilicon proper differs from *Yellow Basilicon* in containing suet and turpentine in addition to the above ingredients, while Burgundy pitch is also used in the preparation of the yellow ointment. *Black Basilicon*, or *Unguentum Tetrapharmacum* (*tettara pharmaka*, 'four drugs'), derives its name from containing one fifth of black pitch along with the three drugs above mentioned. *Green Basilicon* contained verdigris, but has quite fallen into disuse. The resin, wax, and other ingredients of basilicon are melted together over a slow fire; the oil is then added, and the mixture, while hot, strained through linen. The straining is directed in consequence of the impurities which resin often contains. Basilicon ointment, or resin cerate, as it is usually called, is much used as a gentle stimulant application to blistered surfaces, indolent ulcers, burns, scalds, and chilblains.

Basilicon Doron (Gr., 'royal gift') is the name of a work written in 1599 by James I. of England (then James VI. of Scotland) for his eldest son, Prince Henry. It expounds James's views as to the divine right of kings.

Basilides, one of the greatest of the Gnostics, who flourished at Alexandria about the year 125 A.D. Many of his fantastic speculations bear greater resemblance to the doctrines of Zoroaster, and in some points to Indian philosophy, than to the religion of Jesus. The first principle of all

things is the unborn and unknown Father, from whom emanated in succession *nous* ('mind'), *logos* ('the word'), *phronesis* ('understanding'), *sophia* ('wisdom'), and *dynamis* ('power'). From the last sprung *dikaio synē* ('justice') and *eirēnē* ('peace'), and these seven with the Father formed the first Ogdoad, or octave of existence which originated the first heaven. From them emanated other powers which created the second heaven, and so on through the whole circle of emanations, which amount to 365, the mystic number so often inscribed on the symbolic stones in the Gnostic schools (see ABRAXAS STONES). Each of these angelic powers governs a world. There are, consequently, 365 worlds, to each of which Basilides gave a name. The *archōn* or head of the 365th, or lowest world, rules the material universe, which he also created. He is the God or Jehovah of the Old Testament, and when the earth was divided among the rulers of the material universe, the Jewish nation fell to the share of himself, who was the prince of the lowest class of angels. But wishing to absorb all power himself, he strove against the other angels, and to make them subject to his 'chosen people,' the result of which was war, strife, division in the world, together with the loss of the true religion, to restore which the Supreme God sent *Nous*, the first emanation who became incarnate in Jesus at his baptism. His disciples (Basilidians) were numerous in Egypt, Syria, Italy, and even in Gaul, where they continued to exist till the 4th century. Such mainly is the account of the teaching of Basilides given by Irenæus, and accepted by all until the discovery of the *Philosophoumena* of Hippolytus in 1842. According to this, Basilides started with a God unknown and unknowable by human faculties, rather than with a dualism of God and matter or evil, or with a theory of emanation. This non-existent God by his volition created the *panspērma*, or seed, the germ of all things, containing within itself three degrees of divine sonship: one pure, the second gross, the third requiring purification. The great *archōn*, sometimes called Abraxas, next sprung from the *panspērma*, ascended into the firmament, and produced a son greater than himself, by whose help he framed the world. Their rule—the Ogdoad—extends through all the etherial region down to the moon's sphere, where the grosser air begins—the Hebdomad, ruled by an inferior *archōn*, the God of the Jews. The process of enlightenment is thus: first, the mind of the son of the great *archōn* is illuminated; next, the light passes to the son of the *archōn* of the Hebdomad, then to Jesus, who instructs such of mankind as are capable of truth. Their souls go upwards; their bodies return to the primeval chaos. The three progressive periods of human enlightenment are thus the Ante-Jewish, the Jewish, and the Christian. Of all the Gnostic systems, that of Basilides came nearest the dualism of Persia; and latterly it had degraded into actual magic, though it is doubtful how far Basilides was himself responsible. Clemens Alexandrinus charged him with deifying the Devil—thus representing or misrepresenting his dualism. See Gnosticism, and books there cited; also 'Basilides' in Hauck-Herzog.

Basiliscus, brother-in-law of Leo I., shared in the defeat of Heraclius by Genesic (q.v.). After Leo's death he seized the Byzantine throne (475), but, his followers falling away, was taken by Zeno, and died in Cappadocia (477).

Basilisk (*Basiliscus*), a genus of Central American lizards, in the family Iguanidae, remarkable for the erectile crests which the males bear on the back and tail, and sometimes on the head also. A common species, *B. americanus*, may grow to almost

a yard in length; it is predominantly green and brown; it frequents the banks of the rivers in Mexico and Guatemala, and is equally at home on

Basilisk (*Basiliscus nigratus*).

the trees and in the water beneath. The diet is exclusively vegetarian, and the tender flesh of some species is much appreciated. The animals are lively and quite harmless, only in their form suggesting the mythical basilisk. See IGUANA, LIZARD.

The fabulous BASILISK (Gr. *basilikos*, diminutive of *basileus*, 'a king,' so named, according to

The Mythical Basilisk.

Pliny, from the spot on the head like a crown) was by ancient and medieval authors believed to be hatched by a serpent from an egg laid by a cock. It inhabited the deserts of Africa, and, indeed, could inhabit only a desert, for its breath burned up all vegetation; the flesh fell from the bones of any animal with which it came in contact, and its very look was fatal to life; but brave men could venture into cautious contest with it by the use of a mirror, which reflected back its deadly glance upon itself. Trevisa calls it the 'king of serpents that with smile and sight slayeth beasts.' It is described as about a foot long, with a black and yellow skin, and fiery red eyes; and its blood was supposed to be of great value to magicians. The weasel alone could contend with it, curing and reinvigorating itself during the combat by eating rue. The crowing of the cock was also obnoxious to the basilisk.

The word *basilisk* and its equivalent *regulus* are sometimes used in the Vulgate. The authorised English version of the Old Testament sometimes reads *adder*, and sometimes *cockatrice* (as in Isaiah xl. 8). The revised version reads *basilisk*.

The name was anciently applied to a large cannon, usually of brass, throwing a shot of about 200 lb. weight.

Basim, or BASSIM, a town of India, in Berar, 413 miles E. by N. of Bombay; pop. 9000. The former district of Basim was divided in 1905 between Akola and Yeotmal. The town is in Akola.

Basin, in Geology, is a term applied to depressions in the strata, in which beds of a later age have been deposited. Thus, the London basin, consisting of tertiary sands and clays, occupies a hollow in the chalk, which is bounded by the North Downs on the south, and by the chalk-hills of Berks, Wilts, Bucks, and Herts on the north. The term has also been applied to synclinal depressions of strata, as the coal-basin of South Wales. Such

synclinal basins do not necessarily give rise to any corresponding depression at the surface of the ground. See ANTICLINE.

Basin of a river, in Geography, is the whole tract of country drained by that river. The line or boundary which separates one river-basin from another is called the watershed. By tracing these watersheds, the whole of a country or continent may be divided into a number of distinct basins; the basin of a lake or sea being made up of the basins of all the rivers that flow into it.

Basingstoke, a town in the north of Hampshire, 48 miles WSW. of London. It is a place of much activity, being situated at the junction of five main roads to London from the south and west of England, and it is also an important railway centre. Its chief buildings are the fine Perpendicular parish church, the town-hall (1832), and the corn exchange (1885); and it has iron-foundries, clothing-factories, and breweries. Basing House, 1½ miles eastward, belonging to the Marquis of Winchester, for two years withstood the forces of the Commonwealth; but Cromwell at last took it by storm, and burned it to the ground, in 1645. The remains consist of the gate-house and a few walls and mounds. Pop. (municipal borough), 13,000.

Baskerville, JOHN, a celebrated English printer and letter-founder, was born in 1706 at Sion Hill, Wolverley, Worcestershire. A footman to start with, he afterwards became a writing-master in Birmingham, and from 1740 carried on the business of jappanning there with great success. About 1750 he began to make laborious and costly experiments in letter-founding, and succeeded in making types which have scarcely yet been excelled. The quarto *Virgil* printed by him at Birmingham (1756), in Macaulay's words 'was the first of those magnificent editions which went forth to astonish all the librarians of Europe,' and which, 55 in number, included Milton, Juvenal, Congreve, Addison, the Bible, a Greek New Testament, Horace, and Catullus. He died, bequeathing £12,000, 8th January 1775. A foe to all that he termed 'superstition,' he chose to be buried in his own garden, whence (to allow of building there) his remains were exhumed in 1826. See TYPES, and the Life by Straus and Dent (1907).

Basket, a vessel of wickerwork, made of willows, reeds, cane, straw, bast, or other materials, interwoven. The origin of the word is very obscure. It has been conjecturally allied with Lat. *bascauda*, used by Juvenal and Martial, and by the latter given as British; but at present there is no evidence to connect the words. It is found in English since the 13th century, but it does not occur in other Teutonic or in Romance tongues. In ancient Britain the shields of soldiers were formerly made of basket-work as well as their coracles or boats; the latter were made water-tight by being covered with the skins of animals. Similar boats are still used for crossing some of the rivers of India. Window-screens, chairs, pony-carriages, and screens are made of basket-work. Willows are largely grown in Holland, France, and Germany, though those most in request among basket-makers are grown in England in the valleys of the Thames and Trent. In several parts of England and Scotland, great attention is now paid to the cultivation of the willow; and judging from the statements of some of the cultivators, the returns yielded are very satisfactory (see OSIER, WILLOW). The tools required being few and inexpensive, a large number of poor persons are engaged in the manufacture of baskets, that are hawked about the streets by their wives and children. But a large proportion of these are of French manufacture, as is also the case with the

fancy baskets sold by blind asylums.—Basket-ball is a game in which each of two teams of players tries to bat with the hand a ball or inflated bladder into the basket—a net suspended at a height of 10 feet—of the other side. For Basket-fish, see BRITTLE-STARs.

Basle. See BASEL.

Basnage, JAKUES, the son of an able advocate in the parliament of Normandy, was born in 1653 at Rouen, where he became pastor of the Reformed church. On the revocation of the Edict of Nantes (1685) he retired to Holland, and finally settled as minister of the Walloon church in The Hague, having gained the friendship of the Grand Pensionary Heinsius. Here he was called upon to take an active part in negotiating the defensive alliance concluded by France, England, and the States-general in 1717. He was also famous as a writer of church history, especially of the Reformed church (in reply to Bossuet) and of the Jews. He died 22d September 1723.

Basoche. See BAZOCHE.

Basque Roads, or AIX ROADS, off the coast of Charente Inférieure, separated from the Bay of Biscay by the islands of Ré and Oléron, are sometimes named from the small island of Aix there. They were, in 1809, the scene of a naval battle, in which Lord Cochrane (see DUNDONALD) distinguished himself more than Lord Gambier (q.v.).

Basques (Spanish *Vascongados*), a curious people on both sides of the western Pyrenees, forming, despite its small numbers, one of the separate folk-stems of Europe. Whatever its ancient dimensions, its district is now limited to the Spanish provinces of Vizcaya (Biscay), Guipúzcoa, and Álava—the *Basque Provinces*—with northern Navarra; besides the French arrondissement of Mauléon and part of Bayonne, forming about a third of the department of Basses Pyrénées. The French part formed in ancient times three territorial divisions, *Le Labourd*, *La Basse-Navarre*, and *La Soule*, embracing the valleys of the Bidassoa, of the Nivelle, of the Nive, of the Bidouze, and of the Saison, an affluent of the Gave d'Oloron. The Basque country covers roughly an area of 3000 to 4000 sq. m., of which one-sixth is in France. The boundary on the French side is purely artificial. The orographic system is very complicated; it may be compared to an inextricable knot binding the great chain of the Pyrenees to the plateau of the Castiles. The whole country is a medley of valleys, gorges, *cols*, passes (or *ports*), heights, and plateaus. Its general aspect is smiling and gay. In the French provinces one sees indeed abrupt and bare hill-slopes, but side by side with these the plains are cultivated, the mountains covered with firs, beeches, oaks, and chestnuts, with here and there fields of wheat or maize. A large portion of the surface is still uncultivated; often the soil is clothed only with an abundant natural vegetation consisting of ferns, gorse, and heath, made use of to provide litter for the cattle which are kept indoors the greater part of the year. Here and there appears a smiling homestead, its door always open, round it almost always a kitchen-garden or an apple-orchard. Agriculture is in a backward state—the only plough in the Spanish provinces is still the *laza*, a clumsy two-pronged fork as old as the Roman epoch. From the point of view of cultivation, the surface may be divided into two distinct parts—the high mountains covered with rich forests, and the plains divided into fields of maize and wheat, vines, kitchen-gardens, with meadows here and there, as well as apple and chestnut orchards. Of all the crops, that of maize is the most important. The Spanish provinces produce wheat, cider, and those naturally heady

and well-coloured Navarre wines, stored in great goat-skin bottles, that have at least a high local reputation. Maize-bread (*metturre*), a poor quality of cider (*pittara*), a highly seasoned soup of vegetables (*eltzakarri*), and a dish of green cabbages (*gurbura*) are in general use. The foundries excepted, the industries are insignificant, and are mostly worked by strangers rather than the native race. There is a constant stream of emigration, chiefly to South America; and it has been estimated that there are some 200,000 Basques in Argentina alone. Many have gone to Mexico and Cuba. Besides, young persons of both sexes, but more particularly girls, are constantly finding their way (as they have done for centuries) to the large towns in both France and Spain, of whom many marry and never return.

Anthropological research (see Collignon, *La Race Basque*; Keane, *Man Past and Present*) associates the Basques (not as of old with Finns and Esthns, but) with the White Hamites of northern Africa, Egyptians, and Berbers. See the end of this article. The question is often asked, are the Basques ethnologically of a uniform type? It was long believed that they were all brachycephalic, but the researches of Dr Broca, Dr Velasco, Virchow, and Antoine d'Abbadie, both on exhumed skulls and on living subjects, have proved that among the Basques there are two distinct types: a *dolichocephalic*, with a mean cranial capacity larger than that of modern Parisians, and a *brachycephalic*, with a smaller cranial capacity. It is impossible to determine which of these two cranial forms is the characteristic type, and which is anterior to the other. The Basques, then, do not form a pure race, and accordingly we find great variation in height, form, and above all in the colour of the eyes and hair. The Basque, like most peasants of Southern France, is strongly imbued with prejudices, with ancient superstitions, which Catholicism has not been able to eradicate; he is devoted to his peculiar customs, soft and complacent in his manners, but irascible and formidable in his anger; ardent and enthusiastic, but habitually serious; proud and independent, and gifted with a high sense of his personal dignity. His morals are pure and simple; his religious convictions ardent and sincere—there are few families that do not count a priest among their members. His stubborn independence is shown by the tenacity of his assertion of his ancient rights, the *Fueros* ('privileges') (q.v.); and the noble loyalty of his nature by his reckless allegiance to lost causes, notably to that of the Carlists, grandfather and grandson, in 1833-37 and 1872-76, which cost the Basques the last of their ancient and distinctive privileges. The decree of 9th July 1876 destroyed the last remnant of ancient Basque nationality, by introducing the conscription and the same taxation as in the rest of Spain. Two hundred years ago most of the Basques were sailors; they fished the whale and the Newfoundland cod, and we are even told that theirs was the commercial language of Canada. They have produced a large number of great seamen. If we need not believe that they discovered America before Columbus, it is at least true that Sébastien d'Elcano, the lieutenant of Magellan, who actually circumnavigated the globe, was a countryman. To-day nine-tenths of the natives are devoted exclusively to agriculture. The few who devote themselves to liberal studies make indifferent mathematicians, but show much taste for purely literary studies, especially poetry and works of imagination. This race has produced some distinguished men of letters, as Alonso d'Ercilla, Pío Baroja, and Unamuno, and lays claim to the paternity of one of the most remarkable institutions of modern times—Ignatius Loyola, the

founder of the order of Jesus, and Francis Xavier, the most devoted of its missionaries, were Basques.

The Basque still preserves part of his ancient and characteristic costume in the *béret* (*boina*), a blue or red cap, like the Scottish broad bonnet; the belt (*zinta*)—almost always red in France and blue in Navarra—and the short jacket thrown over his shoulder. His shoes are the hempen *espartinac* (Fr. *espadrilles*, Span. *alpargatas*). He wears no cravat, and is usually closely shaved; indeed the first care of the young Basque soldier on his discharge is to cut off the compulsory moustaches of the service. The old men usually wear the hair long. Young and old are armed with the *makhila*, a staff of medlar, loaded at its lower end, which can be hung to the wrist by a leather knot, and which, in the hands of an active fellow, is a formidable weapon. They are passionately fond of games, especially dancing and hand-ball (*pelote*); and there is no village without its *rebot*, where not only young but middle-aged men play in organised matches in presence of the whole village with marvellous vigour and agility. The only one of their distinctive dances that still survives is the grave *matxako*, the so-called 'Basque dance,' reserved for men alone. They sing much, their original songs being mostly in a minor key, the tone sad and sweet, the words expressing usually the sorrows of love. But the most remarkable of their distinctive institutions are the *Pastorales*, or Basque dramas, which now survive, however, only in La Soule, in the two French cantons of Tardets and Mauléon, where they are played every year, on the occasion of some great festival, spite of the opposition of the cures. Each *pastorale* is preceded by a long prologue, and terminated by a morality appropriate to the subject. The emphasis, the gestures, and the rhythm, are traditional as well as the costumes of the actors. The action is always very lively; the movements follow the rhythm of the singing, and in the scenes representing battles the combatants advance and recede regularly, while they repeat the first two and the last two verses of a quatrain, which Wentworth Webster compares to the strophe and antistrophe of a Greek tragedy. The good march calmly and majestically; the bad, with great steps and with horrible gestures; while the devils dance, leap, and run about continually. Usually the spectacle, which is preceded by a promenade of the whole troupe through the village, does not last less than seven or eight hours, yet the attention of the auditors is unbroken. Their impressions betray themselves by expressive interruptions; the death of a hero is usually accompanied by universal cries of 'Ai, ai!' and the discharge of pistol-shots. These *pastorales* are learned by word of mouth during the long evenings of winter. They are all in Basque, from 3500 to 6500 lines in length (*Warwick* has 7116 lines), most of them in verses of eight feet, divided equally into strophes of four verses, of which the second rhymes with the fourth, the two others not rhyming. The measure is often very defective, and the rhyme merely a defective assonance. They are not divided into acts. The strangest anachronisms occur, and events succeed each other without the least transition. In *Claudius and Marsimissa* are found a Roman emperor, a king of France, a Duc de Richelieu, a Pope Julius, a King Nero, Cardinal Baronius, and the grand Turk Mustafa. Charlemagne is represented with blue spectacles, a blue dress, white cotton gloves, a *makhila*, two gold chains, and the cross of the Legion of Honour or a Crimean medal. All of them tend ingeniously to the honour of the Christian religion, and to the disgrace of Saracens and Mohammedanism. In all there figure pagan Turks, whom the devils aid,

and whom the Christians always conquer or convert in the end. Many of them are mere survivals of the old medieval mysteries and moralities, even down to the very buffooneries, more or less gross, which distract the attention of the auditor. Webster discovered that the *pastorales* are all composed directly from the French chap-books hawked about the country, the originals having actually been shown him by their authors. Of course, indirectly through these they go back to the old *chansons de geste*.

Language and Literature.—The wonderful language of the Basques (by themselves called *Eskuaara*, *Euskara*, *Uskara*, a word of uncertain origin, from which are formed the French adjective *Euscarien*, and the national name of the Basques, *Eskualdunak* or *Euskaldunak*, 'those who have the Enskara') stands as yet absolutely isolated from all the tongues of Europe, and furnishes perhaps the only example of a consistently incorporating language. It belongs to the agglutinative division of languages, joining on the varying to the permanent element of the word, and post-fixing for the most part the sounds which express the relations of grammar. It shows in some of its compounds a strange but merely casual analogy with the polysynthetic languages of America, and must be placed morphologically between the Finnic family, which is simply incorporating, and the North American incorporating and polysynthetic languages. Of course, this statement is quite a different thing from a conclusion that Basque has any relation other than a singular analogy either with the Finnic or Magyar on the one side, or the Algonquin or Irokese on the other. Basque employs the Roman character. Prince Louis-Lucien Bonaparte counts 13 simple vowels and 38 consonants, and to these 51 phonetic elements we must add 6 diphthong-vowels and the aspirated consonants. The doubling of consonants is not permitted, and in actual speech many soft consonants are dropped. The letter *r* cannot begin a word. The cases are formed by post-positions, which may be added one to the other, and in the modern dialects the singular is distinguished from the plural only in the definite declension, where the post-fixed article is *a* in the singular and *ak* in the plural; as *gizona*, 'the man,' *gizonak*, 'the men'; *emakumea*, 'the woman,' *emakumeak*, 'the women.' Some of the common suffixes are *k*, the mark of the plural and of the agent; *n*, 'in'; *i*, 'to'; *z*, 'by'; *ik*, 'some'; *ko*, *go*, *dik*, *til*, 'of'; *kotzat*, *tzat*, *tzako*, *kiko*, 'for'; *kin*, *kaz*, *gaz*, 'with'; *gatik*, 'for'; *gan*, *baithan*, 'in'; *gandik*, 'from'; *ra*, *rako*, *ronz*, 'towards'; *gana*, 'to,' 'at,' &c. Of these suffixes some are joined to the definite, others to the indefinite noun, or to both. The personal pronouns are *ni*, 'I'; *gu*, 'we'; *hi*, 'thou'; *zu*, 'you.' There are still four demonstrative pronouns: *a*, *hura*, *hau*, *hori*, but traces of others now lost are seen in the flexions of the verb; *d*, as a third person, subject and object; *t*, as a first person, subject; as *dakust*, 'it see I,' from *d-ikus-t*; *doa*, 'he goes,' from *d-oa*. The pronoun 'self' is rendered by *buru*, 'head.' The relative pronoun is rendered by the suffix *n* agglutinated to the verbal flexion; its oblique cases by the interrogative pronoun *zein*. Basque has no genders, but it uses verbal forms of address, in which the sex of the person addressed is indicated by a special suffix, thus: 'I do not know him,' spoken to a woman, is *eztaikinat*; to a man, *eztaikiat* (for *eztaikikat*). The grammar would be simple but for the verb, which in conjugation is exceedingly complicated.

In its present state Basque rarely employs its regular verbal inflections, and has practically but two verbs, 'to be' and 'to have,' all other verbs

being generally used as participles expressed in a periphrasis. This system consists in combining a verbal noun with an auxiliary verb, and for 'I see it,' saying 'I have it in seeing.' The number of forms possessed by the verbal noun and auxiliary verb is almost endless; not only is there a different form for each of the personal pronouns, whether in the objective or the dative case, but there are also different forms for addressing a woman, an equal, a superior, or an inferior. The verbal adjective is the form given in the dictionary, and corresponds to a past participle, as *ikusi*, 'seen,' followed by the suffix *ko* or *n*, it forms a future and a conditional, as *ikusiko dut*, or *ikusiren dut*, 'I shall see it,' the verbal substantive is merely a locative, as *ikusten*, 'in the sight,' 'in seeing.' The present tense forms of 'to have' are: for the singular, *daut*, *dauk*, *dau*; and for the plural, *dagugu*, *danzu*, *dave*; or, more generally, *dut*, *duk*, *du*, *dugu*, *duzu*, *dute*. The imperfect tense forms are: singular, *neban*, *eban*, *eban*; plural, *genduan*, *zenduan*, *eben*; or, more generally, *nuen*, *huen*, *zuen*, *ginduen*, *sinduen*, *zuten*. The present optative forms are: singular, *duket*, *dukek*, *duke*; plural, *dukegu*, *dukezu*, *dukete*; and imperfect: singular, *nuke*, *huke*, *luke*; plural, *ginkuke*, *zinkuke*, *lukete*. Such is the complete verb; its compound tenses are irregularly made up with the auxiliary *izan*, 'to be'; thus, 'I have had,' *izan dut*; 'I had had,' *izan nuen*. The transitive verbs are thus compounded after the periphrastic method—e.g. from the verbal adjective *ikusi*, 'seen'; 'I see it,' *ikusten dut*; 'I saw it,' *ikusten nuen*; 'I have seen it,' *ikusit dut*; 'I shall see it,' *ikusiren dut*; 'I should have seen it,' *ikusi izanen nuen*; 'that I may see it,' *ikusi dezadan*; 'I can see it,' *ikusi dezaket*; 'I could see it,' *ikusi nezake*. The only irregular verb is *izan*, 'to be.' Its present indicative is: singular, *naiz*, *aiz*, *da*; plural, *gara*, *zara*, *dirade*. The modern periphrastic conjugation, according to Prince Louis-Lucien Bonaparte, has developed in all its dialects eleven moods and ninety-one tenses (each of which has three persons in each number), variable according to the sex or rank of the person addressed; it receives besides a certain number of terminations, which perform the office of our conjunctions. The syntax of Basque, as of all agglutinative languages, is simple. The phrases are short. Composition is so common that it has caused several juxtaposed words to be contracted and reduced, so as to be partially confounded one with the other. This is the phenomenon known as *polysynthesism*, seen in the dialects of America, in which the words that make up a sentence are stripped of their grammatical terminations, and then fused into a single word of cumbersome length. Many words are simply formed thus: *odotsa*, 'thunder,' is made up of *odei*, 'cloud,' and *otsa*, 'noise'; and *illabete*, 'month,' seems to be a compound of *illargi-bete*, 'full moon'; *illargi*, 'moon,' itself being composed of *il* or *hil*, 'death,' and *argi*, 'light.' The vocabulary is poor.

The study of the language is rendered the more difficult by the extreme variability of its dialects. There are perhaps no two villages where it is spoken entirely alike. Prince Louis-Lucien Bonaparte recognises no less than twenty-five dialects, which, however, fall easily into eight great dialects, which again may be reduced to three, Eastern, Western, and Central. Whether or no it was spoken in Paradise, Basque at least baffled the Devil to acquire. After seven years' diligent study in the Labour country, he had only two words, *bai*, 'yes,' and *ez*, 'no,' and even these fled from his memory as he crossed the Pont Saint Esprit of Bayonne.

The history of Basque is very short, and the few

early allusions to it are meagre and uncertain. Beyond the eighteen words of Aimeric Picard's manuscript, discovered in 1881, and the few mentioned *en passant* by Lucio Marineo Siculo in his *Cosas ilustres y excellentes de España* (1539), we have scarce anything until the discourse of Panurge in chap. ix. of the second book of *Pantagruel*. This incomprehensible passage is not found in any edition anterior to Dolet's (1541). The oldest printed book in Basque is a collection of poems, half devout, half amorous, the work of Dechepare (1545), a curé of Lower Navarra. By far the most important is the New Testament, translated by Licarragne, and printed at La Rochelle in 1571 by order of Jeanne d'Albret. Axular's *Gueroco Guero* (1643) is perhaps the most readable.

Basque literature consists mostly of devout translations from French, Spanish, and Latin. Much more interesting than these is the oral literature of the country, though here there is little that is original and spontaneous, even in the songs, children's riddles, formulas for games, proverbs, and stories. The *pastorales*, already spoken of, come first in interest. This primitive people preserves its legends with striking tenacity. Its stories, still told by the peasants in the long winter nights, at their prolonged wedding or other feasts, or at the gatherings from time to time to strip the husks from the ears of maize, are still literally believed in, however much they may seem to contradict modern notions of everyday life. They are *lege zaharreko istorriak*, 'histories of the ancient law.'

History.—The early history of the Basque race is as yet entirely uncertain, but so far it appears that at no time in history was there any Basque nationality properly so called, nor can we go back with any kind of historical certainty to a time when they were more than a small tribe of rudimentary civilisation, located more or less widely in the valleys of the Western Pyrenees. The medieval historians speak of a mountain population, variously named *Cantabres*, *Vascons*, &c., but are unanimous only in the unflattering terms in which they describe them. The pilgrims who crossed the Pyrenees eight or nine centuries ago feared to meet them. In the year 1120 the Bishop of Porto assumed the disguise of a beggar in order to pass safe and sound through the midst of men who were 'murderers, always ready for mischief, cruel and unrestrained,' and who spoke 'an unknown tongue.' It was doubtless they who, three centuries before, had plundered the rear-guard of the Frankish army, and slain the Roland of romance. The French pilgrim, Aimeric Picard, already referred to, speaks of the plundering habits of the mountain people, and of the severe tolls they levied from wayfarers, but testifies that they were good Catholics withal. A formal sentence of excommunication was declared at the third Lateran Council in 1179 against 'the Basques and Navarrese,' who 'practise so many cruelties upon Christians, plundering and ravaging just like pagans . . . without regard to sex or age.' The evidence of the hagiographers is to the same effect: among the many martyrs was St Léon, the first Bishop of Bayonne, killed about the end of the 9th century by 'pirates very cruel and satellites of the devil.' In the pages of Gregory of Tours, Trédegair, Isidore, and others we find frequent notices of the plundering ravages of the mountaineers, and from time to time of more or less successful expeditions to punish them by the rulers on both sides of the Pyrenees. The waves of Moslem invasion hardly reached the base of their mountains, but hither fled the remnants of the routed Christian armies, and here began the reaction which was 'to

result in the 'reconquest.' The peoples who then inhabited the northern provinces of Spain, and who had remained independent, had at least hatred of the eastern conquerors in common, and gradually, under the guidance of enterprising leaders, they grouped themselves together, and formed a number of republics or federal states, from which grew the kingdoms of Asturias in the west; of the Sobrarbe, then of Navarra and Aragon, in the east; and the 'lordship' of Vizcaya. Alava, nearer the Moors, constituted a *Behetria*, a word not understood exactly, but at least the government of the province was essentially oligarchic. Guipúzcoa and Labourd do not appear to have been raised to the dignity of distinct states, but merely to have comprised a number of territorial federations designated by the Spanish name of *Hermanidades* ('fraternities'). La Soule and Lower Navarre were dependent upon the kingdom of Navarre and followed its fate; they comprised a number of vassal *vicomtes*, of which that of Soule had the longest history. The Labourd formed a *vicomté* under the dukes of Vasconie, afterwards of Aquitaine. Meantime the struggle with the Moors went on with varying issue—the most glorious day was the 16th of July 1212, when the kings of Navarra, Aragon, and Castile together overthrew the Mussulmans in the plain of Las Navas de Tolosa. Trophies of the victory may be still seen in the churches of Pampeluna and Roncevaux, and from that day on the shield of Navarra have figured the famous chains.

The fundamental history of all the Spanish states depends on the part they played in the 'reconquest.' Certain special privileges (Sp. *fueros*, Fr. *fors*) became attached to particular districts, dating from the time when these were granted in the face of a dangerous enemy, and later were exacted from the king or count at the settlement of the reconquered lands. All the provinces in the north of Spain had *fueros* of this nature, which ensured to them not merely exemption from particular imposts or burdens, but something like an actual autonomy, consisting chiefly in a more or less absolute exemption from compulsory military service, the right to free-trade, especially in tobacco and salt, the payment of taxes in a lump, and government through provincial *juntas* and officials born in the country. These *juntas*, which met every year at fixed times in some central building, or, as in Vizcaya, under the famous oak of Guernica, consisted of members elected by the countymen, and with them sat the *corregidor* or representative of the king, and the intermediary between the local and the central authority. In the French provinces a *syndic* corresponded to the *junta*; a royal *bailli*, to the *corregidor*. These provinces did not consider themselves as forming an integral part of France or Spain, but were connected by the personal bond of the sovereign alone. Thus the States of Lower Navarre refused in 1649 to send deputies to the States-general of France; and in 1789, when the unity of France and its division into departments had been decreed, the representatives of that little 'kingdom' withdrew from the National Assembly. The Spanish provinces long watched with the most jealous care any encroachment of the crown upon their *fueros*. It was only in 1812, at the time of the Napoleonic usurpation, that Navarra for the first time sent representatives to the general *cortes* of the kingdom—to the famous Cortes of Cadiz. Vizcaya was annexed to Spain by a treaty in 1356; the *hermandades* of Guipúzcoa finally united themselves with Castile in 1200; while Alava, long under a particular fraternity of nobles with an elective overlord, finally yielded its rights by formal treaty to the king of Castile in 1332. In virtue of these

conventions the kings of Navarra, and later, for the three other Basque provinces the kings of Spain, on their accession to the throne, swore solemnly to maintain the *fueros* of the provinces. In Vizcaya this ceremony took place under the oak of Guernica. During the insurrection of 1873-76 Don Carlos the younger revived the ancient ceremony. It was thus celebrated for the last time, for the Spanish government in 1876 suppressed the privileges of Alava, Guipúzcoa, and Vizcaya, just as it had those of Navarra in 1839, after the first Carlist insurrection.

The origin of the Basques is one of the most vexed questions of ethnology and philology alike. The controversy was first turned into a totally new direction by the publication at Berlin, in 1821, of W. von Humboldt's famous *Prüfung der Untersuchungen über die Urbewohner Hispaniens vermittelt der Waskischen Sprache*. The great German savant's argument was that the Iberians were a people spread over Sicily, Sardinia, Corsica, the Spanish Peninsula, southern France, and the British Isles, and that the modern Basques are the remnant of this race elsewhere expelled or absorbed. The main evidence offered was an attempted explanation of a large number of Spanish and other place-names by the known significations and forms of Basque words. This bold hypothesis long found enthusiastic support, but has since been much modified even by its own supporters. Anthropological research has proved the existence of a Neolithic race in Europe, of small stature, with long or oval skulls, and this race has been confidently identified with the Basques and Iberians. Sir W. Boyd Dawkins found the Iberian characteristics in 'the small dark Highlander,' 'the small swarthy Welshman,' and the 'Black Celts to the west of the Shannon.' Webster disposes of the identity between the dark Kelts and the Basques by proving that the Basques are a mixed race, exhibiting a fair as well as a dark variety, and that the former is on the whole the larger half of the present population. It must always be remembered that language and race are not convertible terms, and while the Iberians of ancient Spain may have spoken languages allied to the dialects of the Eskuara, there is no proof that all the tribes called Iberian by classical writers shared the heritage of a common speech. A flood of light may yet be poured on this question whenever the so-called Celtiberian inscriptions and coins—the *letras desconocidas*—shall be deciphered. But these still await their Champollion. There have been many clever theories and attempts at interpretation, but none as yet has gained a recognised authority. But when the day of true interpretation comes, it will mark a great advance in European archaeology, and especially in our knowledge of the Basque question. Mr Rice Holmes thinks that the Basques occupied Spain and southern Gaul before the true Iberians (who spoke the language or languages of the inscriptions) arrived. Anthropological evidence, quite apart from the resemblances that have been traced between the Basque and Berber languages, led Collignon to associate the Basques with the White Hamites of northern Africa, Egyptians, and Berbers, not with the Finns and Esths.

See works by Vinson, Van Eys, Prince Louis-Lucien Bonaparte, Collignon, and Wentworth Webster.

Basra (also *Bassora* or *Bussora*), a port of Iraq, on the western bank of the Euphrates, here called the Shatt-el-Arab, 59 miles from its mouth in the Persian Gulf. The former Turkish vilayet of Basia (53,600 sq. m.; pop. 800,000) lay between Baghdad vilayet and the Persian Gulf. The river (known to seamen as the Basra River) is navigable by ocean-going steamers to above Basra, whence

smaller vessels ascend the Euphrates and the Tigris to Baghdad. The population, once 150,000, had sunk in 1854 to 5000, but has risen again to 80,000, thanks to steamship developments and the Baghdad Railway (terminating at Basra). Its proximity to Persia, Mesopotamia, Arabia, and the Persian Gulf makes Basra a trading-centre of high importance. Its chief exports are dates, bailey, wheat, paddy, wool, seeds, opium, gall-nuts, carpets; imports include textiles, sugar, and wood for date-boxes. Basra was founded in 636 by the Khalif Omar, and soon became one of the most famous and opulent cities of the East. Subject of many contests between Turks and Persians, it is of great note in the history of Arabic literature. It was occupied by British troops on 21st Nov. 1914.

Bass, MICHAEL THOMAS (1799-1884), of the famous Burton brewing firm of Bass & Co., founded by William Bass in 1777, was the son of M. T. Bass; he joined the business on leaving school, and afterwards acted as traveller. From 1848 till 1883 Bass represented Derby in the Liberal interest. His benefactions were very numerous, and included the building and endowing of St Paul's, Burton, and recreation grounds, a free library, and swimming-baths for Derby. Of simple tastes, he declined more than once a baronetcy and a peerage. Both honours were conferred on his son, M. A. Bass (1837-1909)—the former in 1882, the latter in 1886, when he took the title of Baron Burton.

Bass, or BASE, in Music, is the deepest or lowest part, by whatever instrument it may be performed. Next to the upper part the bass is the most striking, the freest in its movements, and richest in effect. In respect to harmony, the bass is the most important part in music, containing more frequently the fundamental notes of the chords, while on it is formed that most important and effective figure in music called 'organ-point' or 'pedal-point'—i.e. the sustaining of one note by one part (ordinarily the bass) of the harmony, while the other parts go on independently.—Bass is also applied to the lowest and deepest male voice. The compass of a bass voice is generally from F below the bass clef to D above it, which should all be chest-notes, except, perhaps, the highest. Exceptionally deep voices are found in Russia, descending to C below the bass clef, and even farther. The bass voice begins to show itself only at the years of manhood, and is generally a change from the alto voice of a boy. It is much more largely used as a solo voice, especially in opera, since Mozart gave it prominence.—Bass or Bass Viol is also the name of an old stringed instrument, with from five to six strings, tuned variously to suit the music, and played with a bow. It was a sort of middle instrument between the contra-bass and violoncello, but is now out of use. Double Bass (q.v.) is the deepest-toned of stringed instruments. See also VIOL. For the Bass Tuba or bombardon, see SAXHORN; for the Bass Clarinet, Bass Drum, &c., see CLARINET, DRUM, &c. For the method of harmonising known as Figured Bass, see the article on Accompaniment, also those on Counterpoint, Harmony, Music, Orchestra, Voice.

Bass (*Morone labrax*), a fish of the sea-perch family (Serranidæ), somewhat perch-like in detailed structure, but salmon-like in shape and colour—blue-gray above, silvery below. It may attain a length of about 3 feet and a weight of nearly 30 pounds, but the measurements of most of those caught are much less. It occurs from the Mediterranean to the Atlantic coasts of Europe, and shoals often ascend rivers in the summer in pursuit of small fishes. It spawns in the sea near shore,

and the eggs float. Bass afford good sport, for they are strong and cunning, and in spite of their natural voracity are capricious as to bait. Ancients and moderns unite in praising the delicacy of the flesh, which is sometimes improved by keeping the fish in fresh-water ponds, as the Romans did. The two European species of Bass must be called maine, though they sometimes explore rivers; two of the North American species spawn in fresh water and return to the sea like the salmon; two others have become permanent inhabitants of fresh water. The American Black Bass belongs to a different genus (*Micropterus*); it has been introduced into some English rivers. The name Stone Bass is applied to various fishes, such as *Polyprion cernum*, a perch-like fish which occurs as a rarity on British coasts, but is abundant in more southern parts of the Atlantic and in the Mediterranean. It is sometimes called the Wreck-fish, in reference to the way in which it follows wreckage, or ships on which barnacles are growing, and this it does apparently for the sake of small animals associated with the barnacles. It is easily taken, and is esteemed excellent for the table.

Bassac, a protected state in the French territory of Laos.

Bassam, GRAND and PETIT, two ports of the Ivory Coast, at the sea-entrance of the Elbie lagoon. Grand Bassam was capital until superseded in 1900 by Bingerville, about 20 miles NW. On the landward side of the lagoon opposite Petit Bassam (renamed Port Bonet) is Abidjan or Abijeau, from which a railway runs inland.

Bassano, a walled town of Italy, in the province of Vicenza, on the Brenta, 30 miles N. by W. of Padua by rail. It has a cathedral, and in the tower of Ezzelino is a fine library. Printing is the chief industry; and there is some trade in wine, olives, silk, and leather. In the neighbourhood Napoleon defeated the Austrian field-marshal Wurmser in 1796. Pop. 10,000.

Bassano (or, more properly, GIACOMO DA PONTE), an artist of eminence, was born at Bassano in 1510, and studied for some time at Venice. He may be said to have founded a school, whose peculiarity was the delineation of common things, markets, fairs, cattle, and country scenes; but his famous altar-piece of the 'Nativity,' at Bassano, shows his power of handling sublime subjects. The special merits of his style are its vigorous and picturesque colouring, and its accurate imitation of nature. He died in 1592, leaving four sons, who all followed their father's profession, but were not marked by any special originality of manner.

Bassas, two ledges of rocks to the south-east of Ceylon, distinguished as *Great* and *Little*—the former group being more to the south-west, and the latter, the most dangerous of the two, more to the north-east. They lie in 6° 11'–6° 22' N. lat., and in 81° 28'–81° 43' E. long. On both are lighthouses.

Basse. See BASS.

Bassein, (1) a thriving town in Burma, on the left bank of the Bassein River, one of the mouths of the Irawadi, 75 miles from the sea, out accessible to large ships. It is an important centre of the rice trade, has considerable trade with Madras, and in a military view also is important, as it completely commands the navigation of the stream. It was captured by the British in 1852. Pop. 37,000. The district of Bassein has an area of 4200 sq. m., and a population of 440,000.—(2) Bassein, a decayed town of 10,000 inhabitants, 28 miles N. of Bombay. Ceded to the Portuguese in 1534, it was a place of much importance as late as 1720, when the population

was 60,000; its remains still point to former splendour. In 1765 it was wrested from the Portuguese by the Mahrattas, and in 1780 surrendered to the British, after a twelve days' siege.

Bassendyne, THOMAS (died 1577), was King's printer in Edinburgh, and printed the New Testament (1576) and Lyndsay's works (1574).

Basses Pyrénées. See PYRÉNÉES.

Basset (Fr., 'dwarf'), a name used with some latitude in France for any very short-legged dogs, but specially for various breeds of sporting dogs resembling (though considerably larger than) the Dachs-hund (q.v.), known in France as *basset allemand*, as distinguished from the *basset français*. They may be divided into straight-legged and crooked-legged, and these again into rough-haired and smooth-haired. They vary in colour, but are frequently, like fox-hounds, tan on the head, and black and white on the body. Bassetts (or basset hounds) are used for tracking deer, boars, &c., and diving them out of coverts; and are best known as companionable pets.

Basse-terre (Fr., 'lowland'), the name of the capitals of St Christopher's (q.v.) and of Guadeloupe (q.v.) in the West Indies.

Basset Horn (Ital. *corno di bassetto*), the richest and softest of all wind-instruments, invented in Passau in 1770, improved by Lotz in Presburg in 1782. It is similar to a clarinet in tone and fingering, but has additional low keys, extending its compass to C in the bass clef, sounding, as the instrument is tuned in F, the F below.

Bassia. See BUTTER-TREE, GUTTA-PERCHA OILS, SAPOTACEÆ.

Bassompierre, FRANÇOIS DE, Marshal of France, was born in 1579 at Harouel, in Lorraine, and came at the age of twenty to the French court, where he gained the favour of Henry IV. Appointed colonel of the Swiss Guards after the king's murder, he was raised to the rank of Marshal of France in 1622; was sent on embassies to Spain, Switzerland, and England; and bore an active part in the siege of La Rochelle. He became, however, an object of suspicion and dislike to Richelieu, who caused him to be cast into the Bastille in February 1631, from which he was not liberated until 1643, after the death of Richelieu. He himself died in 1646. Bassompierre was an accomplished courtier, extravagant in luxury, and excessively addicted to gallantries. At the time of his arrest he destroyed 6000 love-letters. The best edition of his *Journal de ma Vie*, written in the Bastille, is by the Marquis de Chantérac (4 vols. Paris, 1870-77).

Bassoon (Ital. *fagotto*), an important wind-instrument of the reed species, made of maple-wood or plane-tree. The bassoon is an Italian invention; its name *fagotto* meaning 'a bundle,' probably from its being made in different pieces laid one against the other. The French call it *Basson de hautbois*; the Germans retain its Italian name. Its invention is attributed to Afranio, a canon of Ferrara, about 1539, but in some form it has existed from the earliest times. In the middle of the

16th century it had already reached great perfection. Sigmund Schnitzer, in Nuremberg, who died in 1578, was a celebrated maker. Those by

Savary, a French maker, are now highly esteemed. The bassoon consists of a bored-out tube of wood in several pieces, fixed together alongside each other, the bore being conical, and doubled upon itself, so as to bring the holes and keys within the reach of the fingers of each hand. The bassoon has in general not less than 7 holes and 10 keys. In the narrow end of the wooden tube is fixed a small tapering brass tube in the form of an S, on the end of which is placed the reed for producing the tone. The compass of the bassoon is from B flat below the bass stave, to C or F in the treble. The fingering is complicated and variable in different patterns. The notes for the bassoon are written on the bass clef for the lower part, and on the tenor clef for the higher. The best keys for the bassoon are E flat, B flat, F, C, G, D, and A; all the other keys are difficult. It is scarcely known as a solo instrument, though there is some music for it as such—among others, concerti by Mozart and Weber; but it plays an important part in the modern orchestra, its tone being capable of very varied expression. The double bassoon (*contrafagotto*) is of similar construction, but sounds an octave lower. Bassoon is also the name of an organ-stop, the pipes of which are made to imitate the tones of the instrument.

Bassora Gum. See GUM.

Basso-rilievo. See RELIEF, SCULPTURE.

Bass Rock, a remarkable island-rock of Hadingtonshire, near the mouth of the Firth of Forth, 2 miles from Canty Bay, and $3\frac{1}{4}$ miles ENE. of North Berwick. Confronted by the ruins of Tantallon Castle, and formed by a Carboniferous volcanic neck of trachyte, it is about a mile in circumference, nearly round, and 350 feet high. It is inaccessible on all sides except the south, where it shelves down to the water, and thence the landing is difficult, almost impossible when there is any swell. On the west, north, and east, the cliffs rise sheer out of the sea. They are denized by countless numbers of solan geese and other birds, which give the rock a snowy appearance in the distance. A cavern tunnels into the rock from west to east, and is accessible at low tide. In 736 St

Bassoon.

Bass Rock from the Shore.

Balthere or Baldred died in a hermitage on the Bass Rock; in 1316 it came into the possession of the Lauder family. In 1671 Charles II. purchased it for £4000, and within its dreary dungeons many

of the most eminent of the Covenanters were confined during his and James II.'s reign. The Bass was the last spot in the British Islands which held out for the Stuarts. Four young Jacobite prisoners had the address to capture, and, with twelve more who joined them, to hold it for King James, from June 1691 till April 1694, against all the forces which William III. sent against them; at last the spirited little garrison surrendered on honourable terms, and only from a consciousness of failing provisions. In 1701 the fortifications were demolished. Five years afterwards the Bass passed into the possession of Sir Hew Dalrymple. There is a light-house (1902). See an interesting volume on the Bass, by Hugh Miller and four others (1848).

Bass Strait, the channel which separates Tasmania from Australia, contains many islands, chiefly in its southern section, and is greatly beset by coral-reefs. It runs almost due east and west, is about 180 miles long, and has an average breadth of about 140 miles. It was named after Dr George Bass, surgeon of H.M.S. *Reliance*, who settled the question as to its existence. After a preliminary voyage, he sailed round Tasmania in 1798 in a barque of 25 tons, and proved it to be an island.

Bass Viol. See VIOL.

Basswood, the American lime-tree or linden, as producing much bass or bast.

Bast. See BUBASTIS.

Bast, or PHLOEM (formerly often called *Liber*, *Inner Bark*, or *Endophloeum*; see BARK), is a term applied by botanists to distinguish that portion of the fibro-vascular bundle which is characterised by the presence of sieve-tubes, from the woody portion which is distinguished by the presence of vessels (see BARK, VEGETABLE PHYSIOLOGY, DICOTYLEDON, &c.). These sieve-tubes (produced by the longitudinal union of cell-rows, and in communication by means of protoplasmic threads through oblique sieve-like partitions) are, like the wood-vessels, accompanied by a residue of undifferentiated cells, the *bast parenchyma*. These two elements constitute the *soft bast*, and through this layer the elaborated sap descends from the leaves throughout the plant. This region is recognisable under the microscope by the exceeding

e, bast fibres; f, cells of soft bast; g, vessel of soft bast, with four perforate sieve-plates seen on the surface of an oblique septum; g', section through septum and sieve-plates.

delicacy and transparency of the walls of sieve-vessels and bast parenchyma alike, and by the presence of protoplasmic contents; while in longitudinal section, the characteristic 'sieves' (which are not, however, always very easy to observe) furnish an additional characteristic (see fig.). In the soft bast also there may frequently occur *Laticiferous*

Vessels, but these are by no means essential to its structure. Juxtaposed to this soft bast we find the hard bast, which is entirely composed of cells, greatly elongated and thickened into the *bast-fibres*, and to this the important mechanical properties of bast (and consequently, for the most part, the strength, hardness, and toughness of bark) are essentially due. A bast-fibre has frequently a tensile strain greater than that of steel, and the varied economic applications of bast essentially depend upon the fineness and toughness of the fibre; thus the fibres of hemp, flax, jute, &c. are nothing else than bast. The name bast, however, is more usually applied to the inner bark of trees, and is common to the Teutonic languages, designating the inner bark of the Lime (q.v.) or linden-tree, which is employed for making a coarse kind of ropes, mats well known as bast-mats, and a kind of shoes much worn by the Russian peasantry. The trees are cut when full of sap in spring. For bast to be plaited into shoes, young stems of about three years old are preferred; and it is said that two or three are required to make a single pair of shoes. Trees of six or eight years old are cut down for the better kind of mats, which are exported in large quantities from Russia, particularly from the port of Archangel, and which are much used for packing furniture, covering tender plants in gardens, supplying strands with which plants are tied, &c. The trees from which the bast is taken are very generally burned for charcoal. After the bark is dried, its layers are easily separated by steeping in water. The finest layers are the inner, and the coarser are the outer ones.—The manufacture of bast-mats is nearly confined to Russia and Sweden. Lime-tree bast is used in the south of Europe for making hats. The name bast-hat is, however, often given to a hat of willow-wood planed off in thin ribbons, and plaited in the same manner as straw-hats. The inner bark of *Grewia didyma* (Tiliaceæ) is used for rope-making in the Himalayas. See RAPHA.

Bastard, in English law, is a child not born either in lawful wedlock or within a competent time after its determination. In England a bastard is capable of being made legitimate for all purposes only by an act of parliament, 'as was done,' says Blackstone, 'in the case of John of Gaunt's bastard children by a statute of Richard II.' In Scots law, and in most Continental systems of law, a child born out of wedlock may be legitimated—that is to say, become a lawful child by the subsequent marriage of the mother of the child with the father; but English law does not permit this mode of legitimation. The English courts, indeed, applying the principles of private international law, recognise that a child born out of wedlock becomes legitimate on the marriage of his parents, provided that the father of the child is domiciled, both at the date of the child's birth and at the date of the subsequent marriage, in a country in which legitimation *per subsequens matrimonium* obtains; but even in that case English law, while it recognises that the legitimated child is capable of succession to personal property, does not permit him to inherit land in England. Although there is a strong presumption that a child begotten or born during marriage is legitimate, that presumption can be overcome by evidence that no sexual intercourse in fact took place between the husband and wife within such period as is consistent with the husband being the father of the wife's child.

A bastard is incapable of inheriting real property as heir, or of acquiring a share of personal estate as next of kin, to any one dying intestate. So, too, there can be no collateral succession to or through a bastard, for he cannot have any heir or next of kin except the issue of his own body. A bastard is not entitled either to the name of his reputed

father or that of his mother, though he may acquire for himself a surname by reputation. In a will a bequest to 'children' is taken as referring to legitimate children only; unless there are circumstances or expressions inconsistent with that interpretation. Nor does a bastard follow, as legitimate children do, his father's place of parochial settlement under the poor-laws, but he has and follows the settlement of his mother until he attains the age of sixteen, or until he acquires a settlement in his own right, and after that age his primary settlement is in the parish where he was born. Another peculiarity of the status of bastardy is that a bastard being *filius nullius* ('nobody's child'), the consent of his father or mother to his marriage is not required, and is of no avail; but a guardian may be appointed by the Court of Chancery for the purpose, or a license may be granted upon oath made that there is no person authorised to give consent. To this may be added that although in general a father may by deed or will appoint, in the event of his decease, a guardian for his infant child, he has no such privilege if the child be illegitimate.

In other respects, a bastard is very much in the same position as a legitimate person. Thus he can hold land in fee-simple, and can dispose of it as he may think proper, and he can make a will bequeathing his whole estate—a privilege which was not conceded to bastards in Scotland dying without lawful issue till the year 1836. In regard to his personal estate, although the crown is entitled to such in the case of a bastard dying intestate, the royal claim is not strictly enforced; but upon petition the crown's right will be waived in favour of the bastard's family. In the Scots law also the crown may, by what is called a *gift of bastardy*, grant not only the personal but also the real estate of an intestate bastard to the 'donatory,' or person similarly entitled, as in the case of personal property in England. Practically the same effect is produced by royal letters of legitimization during the bastard's life. It is also to be observed that the prohibitions as to marriage which extend to collaterals, and to those related by the half-blood only, also apply although one of the parties be a bastard. Again, the laws relative to incest apply to a bastard. Under the Workmen's Compensation Act, 1906, where a workman has been killed by an accident arising out of and in the course of his employment, an illegitimate child of the workman is entitled to compensation as a 'dependant' of its parent. Similarly, the parent of an illegitimate child is entitled to compensation as a 'dependant' of his child.

In England the maintenance of an illegitimate child devolves in the first instance on the mother. She is for this purpose entitled to its custody in preference to its father; and she is bound to maintain it as part of her family while she remains unmarried, or until the child attains the age of sixteen, or gains a settlement in its own right, or (being a female) is married; and in the event of the mother's marriage, the same liability attaches to her husband. If the mother be of sufficient ability to maintain the bastard while he is thus dependent on her, and neglect that duty, so that he becomes chargeable to a parish, she is liable, by 7 and 8 Vict. chap. 101, sect. 6, to be punished under the provisions of the Vagrant Act. By the Poor-law Act of 1844, as amended by the Bastardy Acts of 1872 and 1873, the putative father may be summoned and compelled to make a proper allowance, not exceeding five shillings a week, for the support of the child till sixteen. This is called Bastardy Order. The father's liability under the order is not released by an order of discharge in bankruptcy. By the Affiliation Orders Act, 1914, the justices of each

petty sessional division or borough are to appoint an officer of court, known as a 'collecting officer,' to collect sums due under such orders.

The chief points in which the position of a bastard differs in Scotland are that he is fully legitimated by the subsequent marriage of the parents, and that the mother has the right of custody only until the age of seven in males and ten in females. This right of the mother to the custody may be suspended in the interest of the child. Up to these ages the father is bound to contribute one-half to the support of the bastard, the other half being furnished by the mother. Thereafter the father may offer to undertake the custody and aliment of the child. The mother is entitled to refuse this offer, but in that event she has no right to enforce further contribution by the father to the child's support. In a question with the poor-law authorities, the father remains liable for the child's support until it is able to support itself.

Both in England and Scotland the widow of a bastard, whether there be issue or not of the marriage, is entitled to dower, *terce*, *jus relicte*, and all the other legal rights of widows. See AFFILIATION, DIVORCE, HEIR, ILLEGITIMACY, LEGITIMATION, MARRIAGE, SUCCESSION, ULTIMUS HERES, VAGRANTS.

In the United States also a bastard is one born of an illicit connection, and before the lawful marriage of its parents; one begotten and born out of lawful wedlock. A man is a bastard if born during coverture under such circumstances as to render it impossible that the mother's husband can be his father, or if born beyond a competent time after the coverture has determined. A bastard has no right of inheritance at common law, and the principal right he has is that of maintenance by his parents. In most states, children born before the marriage of their parents are made legitimate by the subsequent marriage of their parents. See FITZ, BATON-SINISTER.

Bastard Bar. See BATON-SINISTER.

Bastardy, DECLARATOR OF, a suit which may be instituted in the Court of Session in Scotland for having it declared that the lands or effects which belonged to the deceased bastard belong to the donatory in virtue of the gift from the crown. A donatory is usually named by the crown upon application to the Exchequer by parties interested; but in order to complete the title to estate which belonged to the bastard, it may be necessary for the donatory to sue a declarator of bastardy.

In English law, where the existence of a legal right or of a claim to property or to a dignity depends upon the legitimacy of a particular person, the question of the legitimacy of that person may be determined by the court. This is so whether the person whose legitimacy is in question be alive or dead, or whether he be a party to the proceedings or not. The Legitimacy Declaration Act, 1858, enables any British subject, who is domiciled in England or Ireland, or claims some real or personal estate in England, to apply to the Divorce Division of the High Court for a decree declaring him to be legitimate.

Bastia, the former capital of Corsica, is picturesquely situated on a mountain slope, rising from the sea in the form of an amphitheatre, 95 miles NNE. of Ajaccio by rail. Its streets are narrow and crooked, its harbour still somewhat difficult of access, yet it has considerable shipping. Antimony-mining, boat-building, iron-founding, tanning, and coral-fishing are carried on; besides, there is some trade in chestnut-wood extract, wine, and fruit. Pop. 33,000. Founded in 1583 by the Genoese Leonello Lomellino, it was the seat of the Genoese governors for 400 years. It has several

times been in the hands of the English, who, under Admiral Hood, last captured the town in 1794, after an obstinate and protracted siege. When Corsica was divided into two French departments, it was made the capital of one; but when both were united in 1811, the seat of government was transferred to Ajaccio.

Bastian, ADOLF, German traveller and anthropologist, born at Bremen, 26th June 1826, studied at Berlin, Heidelberg, Prague, Jena, and Würzburg, and in 1851 sailed for Australia as a ship's doctor, thereafter travelling in North and South America, Europe, Asia, Africa, and where not else besides. No equally well-equipped ethnologist has ever travelled so widely, and no single observer has accumulated such a mass of invaluable materials for the history of man. It would be difficult to overestimate the indebtedness of the science of anthropology to the practised eye of one restless traveller. His thirty works record his observations in almost as many countries of the world. The most important are in *Der Mensch in der Geschichte* (3 vols. 1860), *Die Völker des östlichen Asien* (6 vols. 1866-71), *Ethnologische Forschungen* (2 vols. 1871-73), *Schöpfung oder Entstehung* (1875), *Die Vorstellungen von der Seele* (1875), *Vorgeschichte der Ethnologie* (1881), *Zur Naturwissenschaftlichen Behandlung der Psychologie* (1883), *Allgemeine Grundzüge der Ethnologie* (1884), *Religionsphilosophische Probleme* (1884), *Der Fetsch an der Küste Guineas* (1885), *Die Mikronesischen Kolonien* (1900), and *Die Völkerkunde und der Völkerverkehr* (1900). He died in February 1905 on a naturalist's expedition in Trinidad.

Bastian, HENRY CHARLTON (1837-1915), physiologist, was born at Truro, Cornwall, and from a private school at Falmouth proceeded to University College, London, where he became professor of Pathological Anatomy (1867), hospital physician (1871), and professor of Clinical Medicine (1878). His works include *Modes of Origin of Lowest Organisms* (1871), *Beginnings of Life* (1872), *Evolution* (1874), and *The Brain as an Organ of Mind* (1880), the fullest scientific exposition till then published of the views on the subject of psychology held by the extreme physiological school. In later works he championed the doctrine of Spontaneous Generation (q.v.).

Bastiat, FRÉDÉRIC, an eminent political economist, was born at Bayonne in 1801. His father was a merchant, and educated his son with a view to the same calling. In 1818 Bastiat entered the commercial house of one of his uncles at Bayonne, and employed his leisure hours in the study of political economy. In 1825 he withdrew from the business, and gave his time to study, especially of economics, extending his knowledge afterwards by travels in Spain and England. Circumstances led him to examine the movement in England for the repeal of the Corn Laws. His first appearance as an author was in 1844, when he published in the *Journal des Economistes* an article on the influence of French and English tariffs on the future of the two peoples. It contained in germ his theory of political economy, and Bastiat from that time was a decided opponent of the system of protection. In 1845 he published a work entitled *Cobden et la Ligue, ou l'Agitation Anglaise pour la Liberté du Commerce*, containing the speeches of the English free-traders. In 1846 he settled in Paris, and devoted his energies to the cause of free-trade. He became secretary of the societies, and chief-editor of the journal established to vindicate its principles; and published his *Sophismes économiques*, in which he attacked the protective system with great wit and controversial acumen. After the revolution of 1848, he was

elected successively a member of the Constituent and Legislative Assemblies. From this time till his death, his strength was applied chiefly to controverting the socialism which became so prominent during the revolution. Suffering from pulmonary disease, he repaired to Italy for change of climate, but died at Rome on the 24th December 1850.

Besides the writings mentioned, Bastiat published *Propriété et Loi, Justice et Fraternité—Protectionisme et Communisme, Harmonies économiques*, and several other important tractates, all of which exhibit extensive knowledge of the subjects discussed, vigorous logic, and a power of sprightly and biting satire (new ed. of his works, 7 vols. Paris, 1881). *The Sophismes* and the *Harmonies économiques* were translated into English by P. J. Stirling.

Bastide, JULES, a French journalist and politician, Minister of Foreign Affairs in 1843, and member of the Constituent Assembly, was born at Paris in 1800. Bastide was early conspicuous among the radical writers of Paris. Holding a command in the National Guard, he took part in an insurrectionary movement in June 1832, and was condemned to death, but escaped to London. Pardonned in 1834, he returned to Paris, and again devoted himself to politics in the columns of the *National*, and in 1847 he founded the *Revue Nationale*. During the revolution of 1848, he was a supporter of General Cavaignac and an opponent of socialism. In 1858 he published *La République Française et l'Italie en 1848*; and in 1859, *Guerres de Religion en France*. He died March 3, 1879.

Bastien-Lepage, JULES, French painter, born at Damvilliers, November 1, 1848, studied under Cabanel, and early began to attract notice by his impressionist, but strong and real pictures in the Salon. Some of his more important works were 'In Spring,' 'The First Communion,' 'The Shepherds,' 'The Wheat-field,' 'The Beggar,' and 'Joan of Arc listening to the Voices.' Striking portraits were those of his grandfather, his father and mother, Sarah Bernhardt, André Theuriot, and the Prince of Wales (Edward VII.). He died of a painful and lingering disease at the height of his fame, December 10, 1884. See works on him by A. Theuriot (trans. 1892) and G. Clausen (1892).

Bastille, a French term for a fortress defended by bastions, was used in this sense in England also after the Norman Conquest. The famous prison to which the name was latterly appropriated, was built by order of Charles V., between 1370 and 1383, by Hugo Aubriot, Prévôt or Provost of Paris, at the Porte St Antoine, as a defence against the English. From the first, however, it was used as a state-prison, Aubriot himself being confined there on suspicion of heresy. During the 16th and 17th centuries it was greatly extended and provided with strong bulwarks. On each of its longer sides the Bastille had four towers, of five stories each, over which there ran a gallery, which was armed with cannon. It was partly in these towers, and partly in underground dungeons, that the prisons were situated. The unfortunate inmates of these abodes were sometimes so effectually removed from the world without as often to be entirely forgotten. But on the whole it afforded comfortable quarters, and prisoners were usually treated with much consideration. The Bastille was capable of containing 70 to 80 prisoners, a number frequently reached during the reigns of Louis XIV. and Louis XV. These prisoners were usually criminals; but some few were victims of political despotism, court intrigue, ecclesiastical tyranny, or family quarrels, and were lodged here in

virtue of *Lettres de Cachet* (q.v.)—noblemen, authors, savants, priests, and publishers. At the beginning of the French Revolution on the 14th of July 1789, the fortress was surrounded by an armed mob eager to destroy the stronghold of tyranny. The garrison consisted of 42 pensioners and 32 Swiss. The negotiations which were entered into with the governor led to no other result than the removal of the cannon pointed on the Faubourg St Antoine, which by no means contented the exasperated multitude. Some cut the chains of the first drawbridge, and a contest took place, in which one of the besieged and 150 of the people were killed or severely wounded; but the arrival, with four field-pieces, of a portion of the troops which had already joined the people turned the fortune of the conflict in favour of the besiegers. Delaunay, the governor—who had been hindered by one of his officers from blowing the fortress into the air—permitted the second drawbridge to be lowered, and the people rushed in, killing Delaunay himself and several of his officers. The destruction of the Bastille commenced on the following day, amid the thunder of cannon and the pealing of the *Te Deum*. The event in itself was apparently of no great moment, leading only to the release of three unknown prisoners—one of whom had been there for thirty years—and of four forgers. In that event only the 654 persons whose names now appear on the column in

The Bastille.

the Place de la Bastille took part, yet it finally broke the spirit of the court-party, and changed the current of events in France. The Bastille had long been regarded as the stronghold and symbol of tyranny, and its destruction was everywhere hailed as the downfall of an evil system. 'But,' said the king when the news was brought him, 'that is a revolt.' 'Sire,' said De Liancourt, 'it is not a revolt—it is a revolution.' See Carlyle's *French Revolution* (ed. Rose, 1903); books by Bingham (1888), Funck-Brentano (1915).

Bastinado (from Fr. *baston* or *bâton*, 'a cudgel'), the name given by Europeans to the punishment in use over the whole East, which consists in blows with a stick, generally upon the soles of the feet, but sometimes upon the back.

Bastion, part of a system of Fortification invented by the Italian engineers about the middle of the 16th century, and generally used until the introduction of the present polygonal system by the Germans at the beginning of this century. A fortified town is usually surrounded by a deep ditch with masonry sides, behind which is the rampart forming a polygon of many sides. It is important to flank this

ditch so as to prevent the enemy collecting in it, and this is done either, as in modern fortresses, by constructing a projecting work in front of the centre of each face of the polygon, or, as formerly, by making bastions at each of its salient angles. The plan of one *front*—i.e. two bastions and the *curtain* or wall connecting them, is given below, with the names of the different lines forming the *trace*. The distance between the

B, bastion; C, curtain; D, flank; E, face; F, salient; G, shoulder; H, gorge.

bastions varies from 200 to 600 yards; a greater distance would make the fire from the flank dangerous for the defenders of the face flanked. The main part of a bastion is the rampart, an immense mound of earth, faced with brick or stone, capable of supporting heavy guns, and of receiving the fire of the enemy. A *hollow* bastion has the space behind the rampart kept down to the level of the natural ground; a *solid* bastion is filled up to the level of the rampart. Vauban devised the plan of having large *detached* bastions opposite the chief angles of the place, with a ditch behind each; a tower or small bastion being placed at the real angle of the wall behind. See FORTIFICATION, SIEGE.

Basutos, a South African people whose country, now directly under the British crown, lies in the angle between the Cape Province, the Orange Free State, and Natal. Basutoland (area, 11,716 sq. m.) is a high and rugged plateau, with a mean altitude of about 6000 feet. The Maluti Mountains occupy much of the interior; the Drakensberg (q.v.) separate Basutoland from Natal and the Cape. It is well watered, produces abundant grass for cattle, and, with its fine climate, is said to be the best grain-producing country in South Africa. The Basutos (better, the Basuto) seem to be a fusion of several Bechuana tribes under a dominant Zulu clan, who early in the 19th century were organised into a powerful state by the famous Moshesh (Mosheshwe, born about 1792). But after 1815 Chaka and his Zulus began a bloody series of wars that changed the balance of power in South Africa, utterly destroyed some peoples, and would have exterminated the Basutos but for their mountainous fastnesses and the help of the Boers. Moshesh and the Basutos received French missionaries gladly, sought to learn the wisdom of the white man, but objected strongly to the settlement in their country either of Boers or of Britons. From 1858 they were intermittently at war with the Boers of the Orange Free State, and in 1868 sought British protection. They were annexed to Cape Colony in 1872, but the attempt to disarm them led to violent resistance (1879-81), and in 1884 Basutoland was placed directly under the British crown, with a paramount chief controlled by a Resident Commissioner under the High Commissioner for South Africa. The natives have a National Council. European settlement is prohibited, and there are only 1400 white men in the country—officials, traders, and missionaries. The capital, Maseru (pop. 1500), is connected with Bloemfontein by rail. There are mission stations at Mafeteng, Morija, &c. The schools are mostly under the Paris Evangelical Mission Society.

Basutoland joined the South African Customs Union in 1891. The population has increased from 170,000 (1884) to about 500,000. They have 433,000 cattle and 87,000 horses; wool, wheat, mealies, and Kaffir corn are the principal products; and coal is raised. Stock, grain, and wool are exported. See books by Lagden (1909) and Ellenberger (1913).

Bat. Bats form an order of mammals in which the fore-limb is modified for flight. To this fact their technical name Chiroptera (Gr., 'hand-winged') refers. The order includes a large number of widely distributed forms, and most people are familiar with the swift and curious flight of some of the common species which hunt for food in the twilight.

History.—Aristotle is often libelled by being accused of regarding these mammals as birds; but he was quite incapable of such a crude mistake. His successors were not, however, and many naturalists down to a couple of centuries ago were content to accept the popular appreciation of these animals as 'unclean fowls,' or to regard them as altogether hopeless puzzles. In 1683 John Ray referred them, with his usual clearness, to the class Mammalia; and Linnæus in 1748 gave them an honourable position along with man and monkeys in the highest mammalian order of Primates. Though often regarded as birds by those who are careless of zoological system, such popular names as Flitter-mouse (Ger. *Fledermaus*) indicate some appreciation of their true position. They are now most accurately described as a special order of much modified Insectivora.

General Characters.—Since bats are Insectivora modified for aerial locomotion, the most striking general character concerns the structures used in flight. A true wing is present, and consists of a skin-expansion spread out between the four fingers, and extending to the sides and to the hind-legs. An accessory membrane extends from the tail to the hind-legs. The fore-legs are much better developed than the hind pair—a marked exception to the general rule. The strong shoulder-girdle, the capacious chest, the very hollow bones of the limbs, the keel on the breast-bone, the position of the teats on the breast, the simple uterus and generally single birth, and many other general characters, are to be interpreted as adaptation associated with the flying habits of these mammals. The discoidal deciduate placenta, the comparatively low brain with uncovered cerebellum, and other features are shared with the Insectivora, and point to the origin of the bats from that group.

Classification and Distribution.—Two natural sub-orders may be distinguished—I. Megachiroptera, fruit-eating forms—generally large, with smooth crowns on the longitudinally grooved grinders, usually with a claw on the third joint of the first finger, inhabiting the warm parts of the eastern hemisphere; II. Microchiroptera, mostly insect-eating forms—generally small, with sharp insect-crunching tubercles on the transversely grooved grinders, with a usually single-jointed, never clawed, first finger, inhabiting the tropical and temperate regions of both hemispheres. (1) The frugivorous large bats form the family Pteropodidæ, including the African *Epomophorus*, the 'flying fox' *Pteropus*, most abundant in the Malayan and Australian regions, but never occurring in Africa, the *Cynonycteris* of the Egyptian pyramids, the very common Indian bat *Cynopterus*, and other genera. (2) The smaller insect-eating bats form much the larger sub-order. They comprise five families: (a) the Vespertilionidæ, including the common Pipistrelle and other *Vesperugo* species, the abundant North American *Nycticejus*, &c.; (b) the family Nycteridæ, such as the large

Queensland form (*Megaderma gigas*) (fig. 3), the common Indian species (*M. lyra*), and the very peculiar genus *Nycteris* of the Ethiopian region;

Fig. 1.—The Greater Horseshoe Bat (*Rhinolophus ferrum-equinum*), flying.

(c) the family Rhinolophidæ, very highly developed bats, with complicated sensory nasal appendages—e.g. *Rhinolophus* and *Phyllorhina*; (d) the family Emballonuridæ, cosmopolitan forms with obliquely truncated snouts—e.g. *Emballonura*, *Noctilio*, *Molossus*, the New Zealand *Mystacina*, &c.; and (e) the family Phyllostomidæ, inhabiting Central and South America, and often characterised by nasal appendages, including the remarkable *Mormops*, the Vampire genus, the blood-sucking *Desmodus*, &c.—The known fossil forms, going back apparently to the Upper Eocene, are all highly specialised, so that the Chiroptera must have diverged from the Insectivora at a very early date.

Structure.—The membrane of flight, the short hind-legs, the capacious chest, the frequent presence of nose-leaves, have already been noticed as external features which at once catch the eye. Some of the characteristic structures must be noted, however, at greater length: (a) *Skin*—The skin is more highly developed in bats than in any other order of mammals. On the one hand it is modified to form the flying fold, extending (1) from the shoulder along the upper arm to the thumb; (2) between the four fingers, and thence onwards to the legs; (3) between the back of the legs and the posterior extremity of the body. On the other hand the skin comes into close association with the sensory function of touch which bats are well known to possess in such a remarkable degree. Spallanzani showed that bats deprived of sight, hearing, and smell, could in a marvellous way fly about a room without colliding with numerous threads hung across it; they could fly through crooked passages, and detect the approach of a hand and the like. Fine nerve-filaments are spread out on the skin of various regions, such as the sides of the muzzle, the outer ear, the nose-plaits, the wing-membrane, &c. The margins of the nostrils and glandular eminences on the sides of the snout are in many forms developed into curious, much folded, leaf-like appendages, kept soft by the secretion of numerous oil and sweat glands, and rendered sensitive by the abundant distribution of nerve-endings. In some cases attaching suckers are developed near the thumbs. Scent glands and bags are frequently present as secondary sexual characters. (b) *The skeleton*—Three types of true wing occur among vertebrates. In the extinct Saurian *Pterodactyls* (q.v.) the skin forming the wing was mainly stretched on the greatly elongated little finger. In the wing of birds the digits are greatly reduced and modified. In bats, the

bones of the palm (metacarpals) and joints of the four fingers are greatly elongated to serve as supports to the greater part of the membrane of flight. The clawed thumb is not included in

uterus, is discoidal and deciduate (see PLACENTA), and the two mammary glands are situated on the chest or under the armpits.

Habits.—Almost all the bats are nocturnal, and sleep during the day hitched up by their hind-legs, with their wings drawn over them. They come out in the twilight to hunt for food, and then their shrill squeak may not unfrequently be heard. The proverbial simile 'as blind as a bat,' must refer to their dazzled behaviour during the day, for they can see exceedingly well with their sharp eyes. Even apart from eyes they are able to steer their way adroitly, as the experiments of Abbé Spallanzani and others have shown. What Cuvier demonstrated in regard to the abundant distribution of nerves on various parts of the body is now known to be the correct explanation of their marvellous sensitiveness. It is also interesting to notice that the circulation of blood in the wings is so active as to amount almost to an inflammation—a suggestive fact in connection with their tender sense

Fig. 2.—Skeleton of *Phyllostoma hastatum* :

a, clavicle; b, humerus; c, radius; d, ulna; e, carpus; f, thumb; f', finger; g, femur; h, tibia.

the wing, but is used for attachment or in the shuffling and awkward attempt at walking. The hind-leg is also utilised in flight as the support of the posterior membrane, and has undergone a curious rotation so that the knee is directed backwards. The claws of the hind-feet are used to attach the bat to the branch or support on which the animal usually rests head downwards. The breast-bone has a keel for the attachment of the powerful muscles working the wings, and thus to some extent recalls the similar structure on the sternum of flying birds. The whole shoulder-girdle is very powerful, and the hip-girdle very weak. In the insect-eating forms, where skilful steering through the air is required, the long tail serves as a sort of rudder. The skull and teeth vary greatly in relation to the different kinds of food. The bones are all slender, and the marrow canals in

those of the limbs are especially large. (c) *Other structures*—The alimentary canal varies with the nature of food, being simpler and shorter in the insect-eating smaller bats. An exceptional type is exhibited by the blood-sucking *Desmodus*, where the blood is probably stored up in a long blind process from the stomach region. The brain is of a low type, but the tactile sensitiveness of the bats exceeds that of any other order. How the lips, nostrils, external ears, &c.

Fig. 3.—*Megaderma gigas*, sleeping.

been already noticed. The testes are on the abdomen or on the groin. The placenta by which the young bat—generally only one—is attached to the wall of the simple or horned

uterus. Bats hibernate in winter, and are found in caves, barns, belfries, forests, &c. in large numbers. A minority feed on fruits, but most are insect-eaters, while a few (not including the vampire) suck the blood of small, and occasionally even of large mammals. The males and females often live apart. **Important Forms.**—Among the large fruit-eating bats, the Flying Foxes (*Pteropus*); the Great Kalong (*Pteropus edulis*), the largest of the bats (14 inches long); the fig-eating South African *Epomophorus*; and the destructive Indian Fruit-bat (*Cynopterus marginatus*) may be mentioned as representative. Some of these do great damage to fruits of various kinds. Among the smaller insectivorous forms, the *Vespertilio* alliance includes the Horseshoe Bats, of which two species (*Rhinolophus ferrum-equinum* (fig. 1) and *R. hipposideros*) occur in Britain; the Lyre Bat (*Megaderma lyra*), often called vampires in India, and said sometimes to eat smaller bats, frogs, fish, &c.; the Desert Bat (*Nycterus thebaica*), which inflates its skin with air so as to form a balloon; the common Long-eared Bat (*Plecotus auritus*), often in church towers; the

Fig. 4.—*Barbastelle*, walking.

Barbastelle (*Synotis barbastellus*); the Noctule (*Vesperugo noctula*), the Pipistrelle (*V. pipistrella*), and two other species of *Vesperugo* occurring along with the four last-named bats in Britain; one of the two New Zealand bats (*Chalinolobus tuberculatus*); the Whiskered Bat (*Vespertilio mystacinus*), common in Europe, and also recorded in England. The thick-legged bats, or Emballonuridae, are represented by such forms as the Mountain Bat (*Emballonura monticola*), living

a social life on the solitary mountains of the Eastern Archipelago; the Tomb Bat of Egypt (*Taphozous perforatus*); the curious Egyptian Rhinopome (*Rhinopoma microphyllum*), abundant in the darkness of the Pyramids; the very ugly Collared Bats

Fig. 5.—Heads of (A) *Epomophorus gambianus*, (B) *Pteropus rodericensis*.

with folded skin (*Chiromeles torquatus*); the short-tailed New Zealand Bat (*Mystacina tuberculata*), which is fonder of walking than most of its kind. This species of bat, and the *Chalinobus* noted above, 'represent the whole indigenous mammalian fauna of New Zealand.' The 'vampires,' or

Fig. 6.—Heads of (C) *Phyllorhina tridens*, (D) *Chiromeles torquatus* (female), (E) *Trachyops cirrhosus*, (F) *Chaeronycteris mexicana*.

Phyllostomidae, include a number of blood-sucking forms, but the chief guilt in this connection must be laid to the charge of *Desmodus*, which sometimes attacks mammals of considerable size, and even man. The Vampire Bat itself (*Vampyrus spectrum*) must be acquitted.

Bats form an order of great interest and importance to the naturalist. From a practical point of view they are of some importance so far as the one set destroy fruit-crops, and the others make up for this by destroying insects, while only a very few are somewhat more sanguinary. See MAMMALS.

VAMPIRE; Sir W. Flower's 'Mammalia' in *Encyc. Brit.*, 9th ed.; Dobson's *Catalogue of Chiroptera in British Museum* (1878), and his *Asiatic Chiroptera*; and *Mammals of Great Britain and Ireland*, by J. G. Millais (1904).

Batangas, a seaport town of the Philippines, the capital of a province in the south-west of the island of Luzon, 50 miles S. of Manila. It was founded in 1581, and is well built, lying on an extensive bay which opens into the Strait of Mindoro. Pop. of town and district, 40,000; of province, 300,000.

Batatas. See SWEET POTATO, IPOMOEA.

Batavi, an old Teutonic people who inhabited a part of the present Holland, particularly the island named from them *Insula Batavorum* (modern *Betuwe*), which is formed by the branch of the Rhine that falls into the sea near Leyden, by the Waal, and the Meuse. Their country extended southward across the Waal. Under Augustus they became allies of the Romans, and earned for their fidelity the honourable title of friends and brothers of the Roman people, and were permitted to choose their commanders from amongst themselves. Their cavalry were famous, and were often employed by the Romans.

Batavia, properly the name of the island occupied by the ancient Batavi, became at a later date the Latin name for Holland and the whole kingdom of the Netherlands. The name Batavian Republic was given to the Netherlands on their new organisation of 16th May 1795, and they continued to bear it till they were converted into the kingdom of Holland, under Louis Bonaparte, 8th June 1806.

Batavia, the capital of the Dutch East Indian possessions, stands on the NW. coast of Java, near the mouth of the Tjiliwong, frequently called the Jaccatra, from the former native town, on the ruins of which the present city was built. The river, which is small and shallow, is connected with a network of canals which intersect the town. The influence of a vertical sun on the canals of this Holland in miniature made Batavia become proverbial as the grave of Europeans. The temperature, though not extreme, is oppressive from its uniformity, the mean of winter being 78° F., and that of summer only 78° 6". Latterly, however, the climate has been greatly improved by draining, and most of the merchants live in the healthier suburbs, which occupy higher ground farther inland, the principal being Weltevreden ('well-content'), Molenvliet, Rijswijk, Noordwijk, and Koningsplein. In some of these suburbs, which form the new town, the houses stand in spacious gardens with trees around them. The old town was formerly surrounded with walls and fortifications, and till 1808 was not merely government headquarters, but the main centre of population. But in that year the walls, useless since the complete subjugation of Java, were demolished, and the seat of government was transferred from the town on the swampy and unhealthy low grounds to Weltevreden, 2½ miles farther inland. Now the old town contains mainly shops, stores, offices, and the houses of natives and Chinese. During the day, however, it is a busy place; and in it are still the town-house, the exchange, the great poorhouse, a hospital, &c. Steam and electric tramways, electric-light, telephones, and other modern conveniences are fully taken advantage of. The bay is spacious, but very shallow towards the shore, and Batavia is accessible only to boats. Accordingly in 1876-86 the government constructed a great harbour 5 miles to the eastward at Tanjong Priok (where there is a very secure anchorage), with two breakwaters, an outer and inner port, and a coal

dock. And thereafter there was a marked increase in the shipping and commerce of Batavia and its port. Batavia rivals Singapore as a commercial emporium of the far East. Its markets present at once all the productions of Asia and all the manufactures of Europe. There are close and direct commercial communications with Singapore, all the Dutch East Indies, Australia, the Netherlands, Britain, and Germany. The chief exports are coffee, rice, indigo, cinchona, tobacco, hides, arrack, sugar, palm-oil, cajeput-oil, tin, pepper, teak, buffalo horns and hides, tea, cassia, sapan wood, tortoise-shell, and tamarinds. The imports comprise cottons, woollens, silks, machinery, iron goods, wine, butter, articles of luxury, and ice (from America). Batavia possesses, besides the citadel and government offices, a society for the arts and sciences, founded 1778; a society for the study of Eastern geography, ethnography, and languages; a national history society, a chamber of commerce, an agricultural society, a gymnasium, a great medical school, and various other educational and learned institutions. In 1811, while Holland was under France, Batavia was taken by the British, but was restored to its former owners in 1816. There is a telegraphic cable of 600 miles from Batavia to Singapore, and a railway from Batavia to Buitenzorg (seat of the governor-general, 36 miles S., with a famous botanic garden) and other points in the interior. Pop. 145,000

Batavia, a city of western New York, on Tonawanda Creek, 36 miles N.E. of Buffalo by rail. It has several mills, and manufactures of sashes and blinds, ploughs, and farming-implements, and is the seat of the state institution for the blind (1868). Pop. 14,000.

Bateman, an American family several members of which have won distinction on the stage. HEZEKIAH LINTHICUM BATEMAN (1812-75), born at Baltimore, managed various theatres in America, and in 1871 took the Lyceum in London. This venture threatened failure, but turned to success by the production of *The Bells* with Henry Irving as Mathias.—His wife, SIDNEY FRANCES COWELL (1823-81), daughter of an English actor, was an actress and dramatist, and after her husband's death managed Sadler's Wells Theatre. She was the first to bring over an American company in an American play, Joaquin Miller's *Danites*.—Their daughter KATE JOSEPHINE BATEMAN, born at Baltimore, 7th October 1842, appeared on the stage at the age of eight along with her younger sister ELLEN (born 1845). In 1860 she acted in her mother's play *Evangeline* in New York. At Boston in 1862 she made her first appearance in one of her most famous parts, the Jewish maiden Leah in an adaptation of Mosenthal's *Deborah*. In 1863-64 she appeared in this character for 210 nights at the Adelphi Theatre in London. On her marriage to Dr George Crowe in 1866 she left the stage for about three years. A later triumph was in the part of Medea (1872), in an adaptation of Legouv  s tragedy. Notable also was her Lady Macbeth, which she played with Irving. After 1881 she appeared little on the stage. She died 8th April 1917.—Miss Bateman's other sisters, VIRGINIA and ISABEL, also became well-known actresses. The former, born in 1854 at Cincinnati, married Edward Compton the actor, and became the mother of Compton Mackenzie the novelist.

Bates, HENRY WALTER, F.R.S., naturalist and traveller, was born at Leicester, 8th February 1825. During his apprenticeship to a manufacturing hosier, he formed a friendship, due to kindred love of natural history, with Mr Alfred R. Wallace, then master in the Collegiate School. In April

1848 the two left to explore the Amazon, where Bates remained till June 1859. In 1861 he published his distinctive contribution to the theory of natural selection in a paper explaining the phenomena of Mimicry (q.v.). The narrative of his travels, *The Naturalist on the Amazons*, which at once took high rank, appeared in 1863. In 1864 he was appointed assistant-secretary of the Royal Geographical Society, which post he filled till his death, 16th February 1892. Bates was pre-eminently a philosophical naturalist, his special study, that of beetles, being mainly for the light which that vast order throws on the theory of descent.

Bateson, MARY, a scholarly historian, daughter of William Henry Bateson (1812-81), Master of St John's College, Cambridge, was born on the 12th of September 1865 at Robin Hood's Bay, Yorkshire. She was educated at schools in Cambridge and Karlsruhe, entered Newnham College in 1884, and won a first class in the Cambridge historical tripos in 1887. She began to teach at Newnham in 1888, and with interruptions continued to do so for the rest of her life. She took much interest in the affairs of the college, and had a prominent part in the founding of historical research fellowships, one of which she held herself in 1903-6. Influenced successively by Mandell Creighton and F. W. Maitland, she gave her attention first to medi  val monastic history, and published among others an important article on double monasteries, and later turned to municipal history. She edited the *Records of the Borough of Leicester* in three volumes (1899-1905), the *Charters of the Borough of Cambridge* (with Maitland, 1901), *The Cambridge Guild Records* (1903), and two volumes of *Grace Book B* (for the Cambridge Antiquarian Society, 1903-5). The Selden Society published her *Borough Customs* in two volumes (1904-6), of which Maitland said, 'Neither Thomas Madox nor yet John Selden will resent the presence of Mary Bateson' on the same shelf. Appointed one of the editors of the *Cambridge Medi  val History* in 1906, she died on the 30th of November of that year. Besides the works named, she contributed much to periodicals, the *Dictionary of National Biography*, and various miscellanies; edited George Ashby's poems (E.E.T.S.), and (with Mr R. L. Poole) Bale's *Index Britannic   Scriptorum*, and wrote a volume on *Medi  val England* (1903) for the 'Story of the Nations' series.—Her brother, WILLIAM BATESON (1861-1928), biologist, born at Whitby, and educated at Rugby and St John's College, Cambridge, wrote *Materials for the Study of Variation* (1894), *Mendel's Principles of Heredity* (1902), and *Problems of Genetics* (1913). He was professor of biology at Cambridge (1908-9), director of Merton Park Horticultural Institution from 1910, and in 1914 president of the British Association.

Bath, the chief city of Somersetshire, is beautifully situated in the wooded valley of the sinuous Avon, 11   miles ESE. of Bristol, and 107 W. of London. Its houses are built wholly of white freestone—'Bath oolite,' worked in the neighbouring quarries—brick being entirely discarded (see BATH-STONE). Set in a natural amphitheatre, with Lansdown Hill (813 feet) to the north, the city has a finer appearance than any other in England, the variety of level giving very commanding sites for its fine and regular streets, crescents, circus, and public buildings. The beauty and sheltered character of its situation, the mildness of its climate, and especially the curative efficacy of its hot chalybeate springs (containing radium) have long rendered Bath a favourite resort. The springs, which supply the baths, were known to the Romans, who here in the 1st century A.D. built baths, of which extensive remains were

discovered in 1755, 1881, and 1896. A large portion of these has been uncovered, including an oblong bath 80 feet in length by 40 in breadth, and a circular bath 32 feet in diameter. The temperature of the springs varies from 97° to 120° F.; they rise near the river-bank, in the centre of the city, and discharge about 500,000 gallons of water daily. The water is most useful in bilious, nervous, and scrofulous complaints, palsy, rheumatism, gout, and cutaneous diseases. Though the gaiety of Bath has greatly waned since the days of Beau Nash (q.v.), there has been a great general improvement in the city. It has a beautiful park (1830) and many open spaces; a theatre, concert-rooms, and other places of amusement; the literary and scientific institution, museum, club-houses, good hotels, &c. Noteworthy edifices are the Assembly Rooms (1771), the Guild-hall (1766), the Pump-room (1797), the Mineral Water Hospital (1737-1861), and the new baths. The Abbey Church (1499-1616) is a cruciform Late Perpendicular structure, with a fine fan-tracery ceiling and a central tower 162 feet high. In 1864 and subsequent years the interior was thoroughly restored by Sir G. G. Scott. Of other churches the finest is the Roman Catholic Priory Church (1863), with a spire 200 feet high. On Lansdown Hill is Beckford's Tower, 130 feet high, built by the eccentric author of *Vathek*. South of the city is Prior Park, built in 1743 by Ralph Allen, Pope's and Fielding's friend, for a time a Catholic college. Bath returns one member to parliament, and conjointly with Wells (q.v.) gives name to a diocese. It has given name to a kind of bun, to a biscuit, to wheeled invalid-chairs, but probably not to bathrick. Coal is found in the neighbourhood. Pop. (1881) 51,814; (1921) 68,648. Traditionally founded by a British prince, Bladud (863 B.C.), Bath is really of great antiquity. It was a Roman station called *Aque Sulis*, at the intersection of the great Roman ways from London to Wales, and from Lincoln to the south coast. The site of the Roman forum is known; and remains have from time to time been discovered of temples, altars, and pavements. Richard I. granted Bath its earliest extant charter, which was subsequently confirmed by Henry III., and greatly extended by George III. Bath figures frequently in literature, in the works of Smollett, Fielding, Anstey, Madame D'Arblay, Jane Austen, Dickens, &c.

See Warner's *History of Bath* (1890); Sir G. Jackson's *Archives of Bath* (2 vols. 1873); and books by Searth (1864), Peach (1873-93), King and Watts (1885), and Barbeau (1904).

Bath, a city and port of Maine, U.S., is situated on the west bank of the Kennebec River, 35 miles S. of Augusta. Shipbuilding is the chief industry, in which it takes high rank amongst American cities. It is an important commercial centre, and owns much shipping, as its river possesses good anchorage and docks, and the harbour never freezes over. Bath was incorporated as a town in 1780, and as a city in 1850. Pop. 15,000.

Bath (EARL OF). See PULTENEY.

Bath, ORDER OF THE. The name of this English order of knighthood is derived from the ceremony of bathing, which used anciently to be practised at the inauguration of a knight, as an emblem of the purity henceforth required of him by the laws of chivalry. The order does not seem to be older than the reign of Henry IV., who, at his coronation in 1399, made 46 esquires Knights of the Bath. Knighthood of the Bath was afterwards from time to time conferred on occasion of great national ceremonials. Charles II. made 68 Knights of the Bath at his coronation, but from that time the dignity fell into

oblivion till revived by George I. in 1725 as a military order, consisting of the sovereign, a grand-master who should be a prince of the blood, and 36 knights. At the conclusion of the great war it was thought expedient, with a view to rewarding the merits of many distinguished officers, both military and naval, to extend the limits of the order, which was effected on the 2d January 1815. But the order was still purely military, and it was not till 1847 that it was placed on its present footing by the admission of civil knights, commanders, and companions. In June 1861 it was further enlarged. Of the first class are the Knights Grand Cross (G.C.B.); of the second, Knights Commanders (K.C.B.), who take precedence of Knights Bachelors. Companions (C.B.) take precedence of Esquires, but are not entitled to the distinctive appellation of knighthood.

The officers of the order are the Dean (who is the Dean of Westminster), Bath King of Arms, the Registrar and Secretary, and the Gentleman Usher of the Scarlet Rod. On the revival of the order in 1725, Henry VII.'s chapel at Westminster was made the chapel of the order, where the stall-plates and banners of the knights were placed over their stalls.

The insignia belonging to the first class are the collar, badge, ribbon, star, mantle, surcoat, under

Star, Collar, and Badge, G.C.B. (Military).

habit, and cap. The collar is of gold, composed of nine imperial crowns and eight roses, thistles, and shamrocks, issuing from a sceptre and enamelled of their proper colours, all united together with seventeen knots enamelled white. The badge of a military G.C.B. is a gold Maltese cross enamelled white, each of its eight points terminating in a gold ball, and in each of the four angles a lion of England; in the centre, on a ground of white enamel, are the rose, thistle, and shamrock, issuing from a gold sceptre between three gold imperial crowns, within a red circle charged with the motto of the order, *Tria juncta in uno*, and surrounded with two branches of laurel in proper colours, issuing from an escrol of blue enamel, containing, in gold letters, the legend *Ich dien*. The badge of a civil G.C.B. is an oval entirely of gold, the external fillet containing the motto of the order, and encircling the above device of the rose, thistle, shamrock, sceptre, and three crowns. The badge is suspended from the collar on occasions when the latter is worn; at

other times it hangs from a broad red ribbon placed across the left shoulder. The star of a military G.C.B. is formed of rays of silver, thereon a gold Maltese cross charged with three imperial crowns, one and two, within a circle of red enamel charged with the motto of the order in gold letters, and surrounded by two branches of laurel issuing from an escrol like that of the badge. That of a civil G.C.B. has the same circle and central device, with rays of silver in the form of a glory issuing from the centre. The mantle is of crimson silk, lined with white silk, with the star embroidered on the left side, and a lace of white silk on the left shoulder. The surcoat is of the same materials as the mantle. The cap is of black velvet, with a plume of white ostrich feathers.

The insignia of the second class are the badge, ribbon, star, mantle, under habit, and cap. The badges, military and civil, are like those of the first class, but smaller, and the ribbon is narrower. The star of the military K.C.B. differs from that of the military G.C.B. in omitting the Maltese cross, and is in form a cross patée. The star of a civil K.C.B. differs from that just described in omitting the branches of laurel and the escrol and its legend. The mantle and cap are nearly similar to those of the G.C.B.

Companions of the Bath have for insignia only the badge, civil or military, as above described, but of still smaller size.

Knights Grand Cross of the Bath are entitled to supporters. Both G.C.B. and K.C.B. place a red

Badge and Star, K.C.B. (Civil).

circle containing the motto of the order outside their arms, with the badge suspended from it, military knights having outside the circle the two branches of laurel, escrol, and legend, as above.

See *The Most Honourable Order of the Bath*, by Jocelyn Perkins (1913).

Bath-brick. See BRIDGWATER.

Bathgate, a town of Linlithgowshire, 20 miles W. by S. of Edinburgh by rail. Freestone, coal, limestone, and shale (since 1852) have been wrought in the vicinity. There are also paraffin and paper works, a distillery, &c. In 1824 the town became a burgh of barony, in 1865 a police-burgh. Its chief buildings are the corn exchange, the academy, and the parish church—a Norman edifice of 1884, with a clock-tower 108 feet high. Sir James Simpson was a native. Pop. 8500.

Bathing. See BATHS.

Bathometer. See SOUNDING.

Bathonian, Bath Oolite. See JURASSIC SYSTEM.

Bathori, or BATORY, the name of a noble Hungarian family that gave a line of voivodes to Transylvania in the 16th and 17th centuries, and one king (Stephen, 1575–86) to Poland. Elisabeth, niece of Stephen Bathori, king of Poland, and wife of the Hungarian Count Nádasdy, caused young girls to be put to death in the dungeons of her

castle, that she might renew her own youth by bathing in their warm blood.

The details of the monstrous story are probably exaggerated, but it at least shows that she was conceived capable of it. When at length, in 1610, inquiry was made into the appalling rumours, it was discovered that this female fiend had caused to be murdered no fewer than 650 maidens. Her accomplices were burnt; but she was shut up for life in her fortress of Csej, where she died in 1614. See Baring-Gould's *Book of Werewolves* (1865).

Ba'thos (Gr. 'depth') is a term employed by critics to designate a ludicrous descent from the elevated to the commonplace in writing or speech, or a sinking below the ordinary level of thought in a ridiculous effort to aspire (see CLIMAX). It is of the essence of bathos that he who is guilty of it should be unconscious of his fall, and while grovelling on the earth, should imagine that he is still cleaving the heavens. A good example of bathos is the well-known couplet:

And thou, Dalhousie, thou great god of war,
Lieutenant-general to the Earl of Mar!

or the well-known encomium of the celebrated Boyle: 'Robert Boyle was a great man, a very great man; he was father of chemistry and brother to the Earl of Cork.'

Baths. *History of Baths.*—We find in history many records of the use of baths either for luxury or medicinal purposes amongst widely separated nations and peoples. The use of heat in some form or other dates from the earliest times, and allusion is made to this fact in Grecian mythology. Andromache is spoken of as preparing a bath for Hector, while we are told Penelope endeavoured to allay the depression caused by her husband's long absence by means of baths and unguents. The weary Herakles was strengthened and refreshed, we are informed, at the springs of Thermopylæ by Athena. On his return from Ithaca, Ulysses found his aged father, Laertes, in what we would now term a 'condition of senile debility,' and promptly advised the use of warm bathing. Hippocrates speaks of the use of warm and tepid baths as a cooling agent in fevers; and Plato also deals with the use of baths in various morbid conditions. Galen and Celsus both advocated warm bathing in hyperpyrexia, and so on. Wherever the Roman Empire extended itself by conquest, baths were erected. They are found in many districts in Britain—first and best known at Bath; also at Corbridge, in Northumberland, near Hadrian's Wall; at Bearsden, in Dumbartonshire; and elsewhere.

About the 5th century bathing rather fell into desuetude in Rome itself, largely owing to the scarcity of water caused by the destruction of the aqueducts by the Huns. But at one time there were no fewer than 850 baths in Rome, some of which accommodated one thousand bathers—of a size, in short, which few cities can boast of at the present day. It is known also that vapour-baths were used by the ancient Mexicans and North American Indians.

Various Types of Baths.—The general conception of a bath to the average person is one of water, either hot or cold. But an almost infinite variety of substances can be used in this connection.

(1) Vapour, such as hot air, compressed air or steam.

(2) Ordinary cold rain or river water, sea-water or brine, such as we find at Droitwich and Nantwich. Droitwich brine contains 30 per cent. of common salt, or about ten times as much as ordinary sea-water.

(3) Mud-baths, peat-baths, sand-baths, and seaweed baths.

Most remarkable of all is the type of vapour-bath used by some uncivilised races, made of the freshly removed skin of some animal, such as a sheep or horse.

Dealing more fully with *water* as a medium for a bath, we have to refer to some of its special constituents and qualities. One of the most important of these is radioactivity. The most active water in this respect, according to Sir William Ramsay, is that of Bath, in so far as the British Isles are concerned. On the Continent the baths of Bad Gastein are specially strong. Much of the benefit derived from medical bathing is at the present day attributed to radioactivity, but whether there is very solid ground for this belief or not is largely a matter of opinion. But radioactivity is certainly not peculiar either to Bath or any of the spas, as it is a quality in greater or less measure of both rain-water and snow, and even tap-water is found to possess it to some extent. Some waters are found strongly impregnated with sulphur, others with arsenic, and others, again, with iron. It is doubtful whether any of these last are absorbed by the skin to any considerable extent, though sulphur undoubtedly benefits some skin conditions from its topical effect.

Temperatures commonly employed are:

Very hot.....	115°-125° F. (over 46° C.).
Hot.....	100°-103° F. (37° to 40° C.).
Warm.....	90°-93° F. (32° to 34° C.).
Tepid.....	70°-80° F. (21° to 27° C.).
Cool.....	59°-64° F. (15° to 18° C.).
Cold.....	40°-50° F. (4·5° to 10° C.).
Very cold.....	25°-30° F. (-4° to -1° C.).

The *Foot-bath* is a most valuable domestic remedial agent. Hot at 110° to 112° F., it is very useful in headache and coryza. It should last about ten to twelve minutes. The effect is enhanced, of course, if mustard be added. A break-fast-cup of mustard bran should be sufficient. A cold foot-bath is sometimes helpful in sleeplessness: the feet are immersed for three to four minutes, and then briskly rubbed with a Russia towel.

The *Sitz-bath*.—The patient sits in the water with his thighs resting against his abdomen, knees and legs covered with a blanket or rug. The hot bath is very comforting in some painful abdominal conditions—relieves head congestion, also various spasmodic conditions. A cold sitz-bath of two or three minutes' duration is a very bracing tonic procedure, and may be employed as an early morning bath. If given for a longer period, it should be followed by a short, brisk walk.

The *Plunge-bath*.—The bath should be about half-full to admit of the person taking it moving about and splashing freely without upsetting the water. The temperature should be about 15° to 22° C., according to the robustness and capacity for reaction of the bather. The bath lasts from one to three minutes. It has a markedly stimulating effect on respiration and circulation, and makes a healthy person feel warm and comfortable. This is probably the most usual form of bath employed as a matter of routine daily by the average person.

Rain-bath or Circle Douche.—Many modern bath-rooms in large houses are fitted with these. The appliance consists of two parts—the shower, a perforated rose about a foot in diameter, about eight feet from the floor, from which the water falls in a fine spray on the bather; and, secondly, the circle douche, which consists in a series of tubes bent into a circle perforated at frequent intervals. There are five to six of these arranged, one above the other, at about six inches apart. The bather thus is situated in a vortex of horizontal sprays, and the effect is most bracing and stimulating. The bath is usually begun with warm water, and

gradually reduced to cold—as low as 10° to 15° C. if the patient can stand it.

Vicky Douche.—The patient lies on a rubber mattress or canvas stretcher, and water is projected on to him from a series of roses arranged above him, so that the whole length of the body is under treatment. At the same time the bathman massages the limbs and trunk systematically. The warm water, of course, renders the joints and muscles more flaccid and easier of treatment. The bath is somewhat relaxing, and lowers the blood-pressure, but is much enjoyed by, and very beneficial to, certain subjects.

The *Aix Douche* closely resembles it. Here the patient sits instead of lying, and is handled by two operators or bathmen. Each has a hose with a rose-nozzle at the end slung over his back, and water from this is projected on to the part to be massaged at a suitable temperature. This bath is also tiring and relaxing, but very beneficial in rheumatic conditions. At Aix patients frequently take them day after day, but fatigue is saved by the carrying of the patient to and from his rooms or hotel well wrapped up, and rest is enjoined after the bath.

The *Modus Operandi of Baths, &c.*—It will be well to consider briefly the principles controlling the use of baths, hot or cold, and their effect on the human economy. In man there are two factors tending to maintain a constant bodily temperature. The first is physical regulation, and the second chemical regulation.

Physical Regulation.—The chief seat is the skin, which has been appropriately described as the largest gland in the body. When cold is applied—cold air or cold water—and then withdrawn, a rush of blood takes place to this gland—the skin surface—constituting what is known popularly as the *reaction*. On its intensity largely depends the efficiency of the bath and the well-being of the subject of it. If reaction be sluggish, it may be enhanced by the application of heat prior to the cold, or by the use of mitten friction, slapping, or by the addition of brine or other substances to the water. Mustard, for instance, will produce a very smart reaction, which may be excessive, and more than the skin will bear. It is absolutely essential, if cold baths are not to have a prejudicial effect on a person's health, that he experience an adequate reaction. The faculty of having a reaction may be acquired. If tepid water be used first for a brief period and slapping employed, and then the temperature gradually reduced after some days, the patient may eventually be able to stand the coldest water, and have a very healthy reaction after, and experience a comforting glow of heat and sense of well-being. Usually if the bather gets a glow very rapidly it passes off, and shivering will begin later. A healthy reaction does not usually become noticeable immediately cold water is applied.

The Chemical Effect.—Baths have a chemical effect on the body through the action on metabolism or tissue change.

The colder the bath, the more rapid is the heat-loss. Most heat is lost in the first minute of the bath, and then it gradually decreases. Failing a healthy reaction, further heat is lost by radiation, conduction, and evaporation, and at the same time heat production in the body is interfered with. If an adequate reaction has taken place, the loss by radiation and conduction is scarcely noticeable. Shivering, which takes place if a proper reaction has not occurred, is really a conservative effort of nature, for the involuntary but active movements of the muscles which take place must be regarded as a protective agent against cold. The tonic effect of cold baths is to be seen often in the improvement in the muscle-tone of the person taking them—a stronger nervous system and will-power.

There is at present rather a reaction against the cold bath, however. The thing may be overdone, and it is questionable if the Spartan ordeal of a tub in one's room on which the ice has to be broken in the winter is good for the average person. Persons of feeble constitution are much wiser to have a tepid bath, and cold sponge down the spine to finish.

The Japanese favour hot baths up to 125° F., which calls for some training. Few Europeans can stand hot water to the whole skin surface above 108°, and even that may produce giddiness and fainting. A hot bath of short duration is, however, just as tonic in character as a cold one. A warm bath of 90° to 95° F. is relaxing at all times.

Medicated Baths.—Baths may be medicated in various ways—by the addition of acids or alkalis, pine extract, mustard, and so on. A nice, soothing bath in some irritable skin conditions is made by adding half a pound of baking soda to 30 gallons of water at 100° F. Sulphur baths may be prepared from sulphurate of potash (3 oz. to 30 gallons), or from a preparation known as Sulphaqua, obtainable at any good chemist's. Pine baths, very soothing and pleasantly aromatic, are made from extract of pine-needles, a somewhat tarry preparation obtained from the Black Forest. About 4 oz. is needed for a 30-gallon bath. Carbonic acid baths are made in various ways—by passing pure carbonic acid through the water from a cylinder, or by charging the bath with bicarbonate of soda first, and then adding formic acid. These last are useful in heart disease of certain types, and are similar to the Naulheim baths, the water at Naulheim being, however, naturally effervescent, and charged with what is known as *mutterlaug* (mother-liquor). Mustard baths cause a very brisk reaction in conditions of chill after exposure, &c. Care is needed in estimating the quantity of mustard for each individual, as what some people may stand with perfect equanimity would produce in others a smart erythema. From a tablespoonful upwards in 30 gallons of water might be tried. Mustard bran, a special preparation of a coarser and more dilute kind, is used. Brine baths are at their best at Droitwich, Nantwich, and Salzburg, where the natural hot brine is to be had; but a very good imitation may be made at home with coarse fishery salt, adding 1 lb. to the gallon or more. People with tender skins must again beware.

Mud-baths and Peat-baths.—The best application of this kind is the Fango-bath or pack. The mud, which is obtained at Battaglia or Acqui, is of volcanic origin. Peat-baths, Moorbäder, and Schlamm-bäder are other varieties. Fango is a soft, grayish-brown, plastic substance of the consistency of butter, and equally soft to the touch. It has no odour, being entirely free from sewage contamination. It is applied at about 44° C. or 110° F., like a large poultice, and both conveys heat and retains it. It is most useful in many forms of rheumatism, lumbago, rheumatoid arthritis, sciatica, &c. It can be obtained at various resorts on the Continent—Baden, Schaffhausen, and Kissingen—and in this country at Matlock Bath and Peebles. Peat or moor baths consist of a soft mass of siliceous mud, containing both organic and inorganic matter. They are given at a temperature of about 50° C. or 120° F., or even higher. Duration is from half-an-hour to one hour. They are useful in gout, rheumatism, neuritis, lumbago, &c. Sand-baths are sometimes used for raising the body temperature and exciting the skin. Local hot sand-baths may be used for rheumatism, by baking sand in a tin, and then plunging the hand in it when a suitable temperature has been reached. They are used at Harrogate, Peebles, and Lavey in Switzerland.

Turkish Bath.—This is a very ancient form of bath, somewhat waning in popularity now owing to the more rapid methods of producing perspiration, such as the hot-air cabinet and the electric-light bath, with which many large modern houses are equipped at the present day. In Rome and other cities in Italy the ruins of Turkish baths used in the time of Nero may be seen. One so complete and well-preserved as to be used regularly at the present time is to be seen in Jerusalem, which dates from the time of Herod, nearly two thousand years. The amount of space required and expense involved in the construction of a good Turkish bath restricts its presence to anything but towns of fairly large size. It consists usually of two rooms, and perhaps a dressing and shampoo room as well. The hot room, or caldarium, is usually heated to about 110° C. or 230° F. The tepidarium runs from 44° to 54° C. (130° F.). There is sometimes either a hotter or cooler room than either of these. The shampoo-room is furnished with marble douche-slabs, on which the patient is lathered and massaged, and he usually finishes off with a plunge into a small swimming-bath or a warm spray. The dressing-room is furnished with suitable couches, on which the patient should rest from thirty to forty minutes after a bath, and perhaps refresh himself with a cup of coffee. The rooms are usually heated from a coke furnace, and must be very carefully ventilated, at once to avoid draughts and subsequent headache. The outlet for foul air should be near the bottom of the room, opening into a ventilating-shaft. For the average person fifteen to twenty minutes in the hot room and half-an-hour in the cool is enough to produce a profuse perspiration, but, of course, different subjects vary greatly. No one should suddenly take up Turkish baths unless he has been examined and passed as fit by a medical man. People past sixty should be particularly careful, as headache, dizziness, and an apoplectic attack may be easily induced. Patients with high blood-pressure and kidney disease past middle life should on no account take them. The powerful stimulation of the sweat-glands usually results in considerable loss of weight, for the time being at any rate; but some individuals gain weight on a course of the baths, and feel exceedingly fit.

The Russian Bath.—This is really a steam or vapour bath, the patient being shut into a small chamber, adequately ventilated, into which steam is slowly introduced through perforated pipes. The temperature is about that of the warm room in the Turkish bath, the moisture rendering high temperatures unbearable. The average duration is fifteen to twenty minutes. This bath suits some people with dry skins who do not perspire readily or at all in the Turkish bath. The patient finishes with a spray or shampoo, as in the Turkish. In both the above baths the comfort of the patient is increased by a damp towel around the head, and, if there be any tendency to headache, a warm foot-bath may be used as well.

Public Baths.—The use of public baths by the Romans has been above referred to. Their introduction into this country was postponed until many centuries after the Roman occupation. It is not highly creditable to the national cleanliness that not until the year 1846 was an act passed to enable parish councils and vestries to establish baths and wash-houses, the expenses of which were chargeable on the rates. In 1878 a further act, amended in 1880, permitted the erection of swimming-baths. These are now very generally found in all large towns. In Japan mixed bathing is considered quite orthodox, but in this country it is almost invariably the custom for the sexes to be strictly kept apart. Swimming-

baths vary considerably in size, but the depth is usually 6 feet 6 inches at one end and 3 feet at the other. While drowning accidents in such places are very rare, they are by no means unknown, and some means of rescuing any one in difficulties should be at hand—a long pole or a lifebuoy, for instance. The water is usually slightly warmed to about 55° to 60° F. Needless to say, it is important to indicate very plainly which is the shallow end of the bath, as diving from the wrong end has at times ended fatally. On the Seine very agreeable swimming-baths are formed by means of a sort of floating platform with no centre-piece. A stair leads down from the bank or street to the turnstile; dressing-boxes are all round, then a 6 to 8 foot platform; while in the centre a large swimming-bath is provided by the waters of the Seine flowing through, and, of course, constantly renewing the bath-water.

Sea-bathing.—Sea-bathing is probably the most interesting to most people, and is very health-giving if used with discretion. Needless to say, the pleasure is enormously added to if the bather can swim. In this climate sea-bathing earlier than May or later than September is a doubtful pleasure, and not suited to any but the most robust. At Brighton there are a few habitués who usually pride themselves on their New Year 'dip,' but this is not common or desirable. Young people are apt to tire and exhaust themselves in summer by staying in the water too long, and a hot sun on the head may produce unpleasant sensations. Twenty minutes to half-an-hour is quite enough for an average person to begin with, swimming or otherwise; and a rest should be taken after a little. Care should be taken invariably when bathing in a new district to ascertain from some one knowing the locality the nature of the beach, the slope, presence of rocks, and currents of tidal nature, &c. Many of our summers are marred by tragic drowning accidents which would have been avoided had reasonable precautions of this character been taken.

Electric Baths—The electric water-bath is not now much used. Water being a better conductor of electricity than the human body, the major portion of the electric current employed passes through the water and not the patient. Probably the latter only gets one-third of the current indicated on the meter (galvanometer). Further, great precautions have to be taken to avoid the risk of 'short circuit' and a shock to the patient. Quite a number of deaths have been caused in recent years by these baths: the patient while in the bath lays hold of a gas or water connection, and so forms an earth contact, and receives a very large 'dose' of electricity from the main wire, which has been dammed back by rheostats or resistance wire from the bath. The four-cell electric bath is much to be preferred. It consists of four porcelain or glass vessels, into which the patient places his right and left hands and feet respectively. The current, which may be faradic, galvanic, or combined galvano-faradic, or what is known as a sinusoidal or wave current, is applied through a special and rather complicated switch; but a great variety of methods of application is available, so that the current can be given in fifty different ways. It may also be applied to the arms alone or the legs alone, and cataphoresis may be employed at the same time—that is, the introduction of drugs such as iodide of potash, and salicylate of soda, and so on, by means of the electrical current. See HYDROTHERAPY, MINERAL WATERS, SWIMMING.

Bath-stone, a building-stone extensively used in England on account of its beauty, is obtained from quarries in the Lower Oolite, in Wiltshire and Somersetshire. It is fine-grained, of a rich cream

colour, and is composed of about 94½ per cent. of carbonate of lime, and 2½ per cent. of carbonate of magnesium, but is free from silica. It is easily wrought in the quarry, some beds cutting almost as readily as chalk, and hardens on exposure to the air, but is not very durable. Within twenty-five years after the repaving of Henry VII.'s chapel in Westminster Abbey, with this stone, it had begun to decompose.

Bathurst, a name applied to various localities in honour of Earl Bathurst, Colonial Secretary (1812-28).—(1) BATHURST in New South Wales, the first county settled beyond the Blue Mountains (q.v.), which were long believed to be impassable. It was not before 1813 that a practicable route was discovered. Bathurst was still further distinguished as the seat of gold-fields, discovered in 1851. The county is bounded on the N.E. by the Macquarie, and on the SW. by the Lachlan; it is well watered, and has a moderate temperature. The whole district is admirably suited for agriculture. Mining—principally for gold and copper—is still carried on sporadically. The chief town, Bathurst, on the Macquarie River, 96 miles W. of Sydney, is one of the principal towns in the western district of New South Wales, and is a handsome city with numerous elegant public buildings. Elected into a municipality in 1862, it is connected with Sydney by rail (144 miles), and contains government railway workshops, breweries, tanneries, coach-factories, and flour-mills; soap, candles, glue, and boots and shoes are also manufactured. It is the seat of an Anglican and of a Roman Catholic bishop. Pop. (1891) 9170; (1911) 8575; (1921) 9270.—(2) BATHURST ISLAND, off North Australia, about 12° S. lat., and 130° E. long. It is included in the Northern Territory of Australia, and is close to the much larger Melville Island, and is partly wooded, partly barren.—(3) BATHURST, the principal settlement of the British colony on the Gambia (q.v.). It is situated on St Mary's Isle, a sand-bank at the mouth of the river. The stores of the European merchants face the river, as well as the government house, barracks, and hospital. Pop. about 8000.—(4) An island in the Arctic Ocean, intersected by the 100th meridian, and situated immediately beyond the 75th parallel.—(5) BATHURST INLET, an arm of the Arctic Ocean, projecting due south for about 75 miles into the North American continent, just touching the Arctic circle and 110° W. long.—(6) A division in the east of the Cape Province, formed from the district of Albany, contains Port Alfred, Bathurst, and other small towns; pop. (1911) 12,402—white, 2000.

Bathurst, EARL, a title conferred in 1762 on ALLEN BATHURST (1684-1775), a Tory statesman, and the friend of Pope, Swift, Congreve, Prior, and Sterne. He had been raised to the peerage forty years before as Baron Bathurst.—His son HENRY (1714-94), second earl, sat for Cirencester from 1735 to 1754, and from 1771 to 1778 was Lord Chancellor—'one of the weakest, though one of the worthiest,' that ever sat on the woolsack.—His son HENRY (1762-1834), third earl, was Secretary for the Colonies from 1812 to 1828. To the same family belonged Henry Bathurst (1744-1837), from 1805 Bishop of Norwich, the 'only Liberal bishop' of his day; and his son Benjamin (1784-1809), who disappeared mysteriously between Berlin and Hamburg, as he was travelling with despatches from Vienna.

Bathybius, the name given to a supposed low form of life found at the bottom of some parts of the deep sea, but usually regarded with much scepticism. In 1857, during the explorations connected with laying the Atlantic cable, attention was first directed to the presence at great depths of

a slimy mass which was first described by Professor Huxley in 1868, and called, in honour of Professor Haeckel, *Bathybius haeckelii*. The supposed organism consisted simply of formless masses of slime without any detectable structure, and containing numerous curious limy concretions. In the same year, Sir Wyville Thomson and Professor W. Carpenter had, in the *Porcupine* expedition, opportunity of examining bathybius in its fresh and apparently living state; and in 1870 Haeckel published a more detailed account of this apparently simplest form of life. His description, like that of Huxley, was wholly based, however, on preserved specimens. Apparently simpler than any of the lowest forms of life (*Monera*) which had been previously discovered, bathybius excited great interest. From the results of the *Porcupine* dredging it was expected that this living slime would be found abundantly diffused in the great depths; but this hope was cruelly disappointed. During the prolonged explorations of the *Challenger* (1872-76) the bathybius was not rediscovered. Nor was this all; for Sir John Murray was led to suspect that what had been regarded as living matter was only a gelatinous precipitate of sulphate of lime from sea-water mixed with alcohol. So strong was his suspicion, that he withdrew his previous opinion as to the existence of any such organism. Huxley regarded this step as justified, and also abandoned bathybius to its fate. This instance of the fallibility of modern scientists was not unnaturally taken advantage of by opponents, and made the basis of large assumptions as to the general shakiness of scientific conclusions. Haeckel refused to abandon his namesake, and was apparently justified by the fact that in a later North Polar expedition (1876) Dr Bessels discovered a similar quasi-organism, which he named *Proto-Bathybius*, but which most naturalists regarded as merely the result of the protoplasmic debris of larger protozoa which sink down to the bottom as they die. The case for the existence of such a low form of life, at best doubtful, was found quite insufficient to rebut objections—bathybius is an obsolete hypothesis. See LIFE, MONERA, PROTOZOA, PROTOPLASM, SPONTANEOUS GENERATION, &c.

Bathycles, a Greek sculptor from Magnesia, in Caria, who about the middle of the 6th century B.C. migrated to Sparta, and executed a colossal throne with admirable reliefs, described by Pausanias.

Bathyllus, a freedman and favourite of Mæcenas, born in Alexandria, who as an actor at Rome helped to develop a rude pantomime into regular dramatic art.

Bathym'etry, the art of measuring depths in seas and lakes; see SEA, SOUNDING.

Batignolles, a northern arrondissement of Paris, socially somewhat the equivalent of our Whitechapel.

Batiste, the usual French name for cambric, applied in commerce to a fine texture of linen or cotton. According to Littré, the word is due to the name of the original maker, Baptiste, whose statue is at Cambrai; according to others, to its use in wiping the heads of children after baptism.

Batjan. See BATCHIAN.

Batlapins, a numerous Bechuana tribe, weakened by war with Matabele and Boers, and now mainly in the Transvaal, near Vryburg.

Batley, a manufacturing town in the West Riding of Yorkshire, 8 miles SW. of Leeds; since 1868 a municipal borough, forming (since 1918) a parliamentary borough with Morley and Ossett. Batley has about 50 mills and factories, being a

chief seat of the shoddy and heavy woollen manufactures—army cloths, flushings, pilots, druggists, &c. It has a town-hall (1864-74); an old parish church, Perpendicular in style; some 30 other churches; a free grammar-school (1612; reconstituted 1874); a chamber of commerce; a mechanics' institute; waterworks (1871-78); and a market-house. The population has increased rapidly: (1851) 9308; (1871) 20,871; (1921) 36,151.

Batman (Fr. *bât*, 'a pack-saddle'), the soldier-groom of a mounted officer. Every officer in the British army, when doing duty with his regiment, is allowed to employ a soldier as body-servant, and if mounted, a second as groom. These men are struck off all ordinary guards and duties, and receive from the officer a small monthly addition to their pay. On the march and on active service they take their places in the ranks.—*Bât* horses are baggage animals—not chargers.

Batn-el-Hajar ('Womb of Rocks'), a stony district of Nubia, stretching along the Nile in the neighbourhood of the third cataract. The Nile, in the upper portion of the district, is often forced by the approaching rocks into a very narrow channel, and its navigation is frequently interrupted by small islands, rocks, and rapids. The granite hills in some parts attain a height of 2000 feet above the river.

Baton is the name of a short staff, presented by the sovereign to each field-marshal, as the symbol of authority. It is also the name of the long staff carried by the drum-major of an infantry regiment. Baton is also the name of the policeman's truncheon, and of the rod wielded by the conductor of an orchestra. (The French *bâton* originally meant simply a stick.)

Baton Rouge, a city on the east bank of the Mississippi, 129 miles above New Orleans, from 1847 to 1862, and again since 1880, the capital of the state of Louisiana. It was one of the earliest French settlements, and as far back as 1838 was the seat of a college. Baton Rouge contains a national arsenal and barracks, a military hospital, an asylum for the deaf and dumb, state penitentiary, an elegant state-house, and several churches. The district is very fertile, producing large quantities of cotton, sugar, and maize. Baton Rouge was more than once the scene of important operations during the civil war. It was occupied by Federal troops after the capture of New Orleans, and defended by General Williams, who fell in fighting against the Confederate general Breckinridge, August 5, 1862. Pop. 22,000.

Baton-sinister, a well-known heraldic indication of illegitimacy. It is a diminutive of a Bend-sinister (see BEND), one-fourth of its width, and couped at the ends—i.e. not extending to the sides of the shield, so as to resemble a marshal's baton or truncheon laid diagonally over the family arms from sinister to dexter. From the 15th century onwards it has been largely assigned in England to the illegitimate issue of the royal family. Heraldists say that it may be of metal in the

Baton-sinister.

case of bastard descendants of royalty, but in other cases should be of colour, even though placed on colour. In the example represented, the arms of the Duke of Grafton (descended from an illegitimate son of Charles II.), the baton-sinister

is composed of six pieces argent and sable. The terms 'Bar-sinister', 'Bastard Bar' are often erroneously used for Baton-sinister; the former, for instance, is of frequent occurrence in Thackeray's *Esmond*.

Batrachia. See AMPHIBIA.

Batrachomyomach'ia ('the War of the Frogs and the Mice'), a Greek mock-heroic poem, erroneously ascribed to Homer, with whose works it has been generally printed. Pigres of Caria, who lived in the times of the Persian wars, was named amongst the ancients as its author. It is a parody on the *Iliad*, in which the military preparations and contests of beasts, with single combats, intervention of the gods, and other Homeric circumstances, are described with much humour.

Batrachospermum, a genus of algae classed among the red seaweeds (Florideæ or Rhodophycæ), though they are greenish, and are confined to fresh water. They form masses of branching threads enclosed in a gelatinous substance. They take their name from their resemblance to frog's eggs.

Batrachus. See FROG-FISH.

Batschia, or HUMBOLDTIA, a genus of Leguminosæ (Cæsalpinoideæ), low trees and shrubs, found in Ceylon and Further India. *B.* (or *H.*) *laurifolia* is remarkable for the hollow obconical internodes, three to five inches long, of the flowering branches. A slit forms opposite the insertion of the leaf. This slit is enlarged by small black ants, which take up their abode within, and protect the inflorescence against injurious insects. Branches without flowers are normal.

Batshian. See BATCHIAN.

Batta, in the British army in India, is an allowance in addition to the ordinary pay of officers. The pay is fixed; but the batta varies according to the part of the country in which the troops are placed, and also depends on the circumstance of their being in the field or in cantonments. If in the field, or more than 200 miles from the presidential government cities, the officers receive full batta; if in garrison, or in cantonment within that distance, half batta. The word is Indo-Portuguese, as old at least as 1548, and most likely originally derived from the Canarese *bhatta*, 'rice in the husk.'

Battalion, an infantry unit for both tactical and administrative purposes. The war-strength of a British battalion is 1000 all ranks, exclusive of 100 left at the base, providing about 850 bayonets at the front. This, approximately, has been adopted as the proper strength of a battalion in all European armies. Its front in line two-deep is about 350 yards, and its length in column of route about 800 yards. The British battalion was reduced in 1912 from 8 to 4 companies, each commanded by a captain (one by a major), with a captain and 4 lieutenants under him. There are 30 officers in all. The whole is commanded by a lieutenant-colonel, who has, as regimental commissioned staff, a major, an adjutant, a quartermaster, or Lewis gun officer, and an officer of Army Medical Corps (see COLONEL, MAJOR, &c.). Some of the bandmen are trained as stretcher-bearers, and all accompany the unit to the field. There are 17 signallers, 16 stretcher-bearers, 9 sergeants on the battalion staff, and 10 sergeants and 10 corporals per Company (q.v.). A battalion is made up to war-strength, or is 'mobilised,' by eliminating the immature and unfit, and calling up men from the army reserve (see ARMY). Regular battalions are linked territorially in pairs, one of each pair being usually abroad. In Britain 4 battalions constitute a brigade of infantry (see BRIGADE). In most other armies 3 battalions form the tactical and

administrative unit called a Regiment (q.v.), and 2 regiments go to make up a brigade.

Battambang, or PHRATABONG, a town of Cambodia, on the Sang Ke, which flows into Tonle Sap, was ceded by Siam to France in 1907; pop. 5000.

Battas, or BATAK, a remarkable race belonging to the Malay stem, inhabiting the part of Sumatra south of Atjeh. Originally spread over the whole northern half of the island, they are now shut in on all sides from the sea, but in the highlands of the interior they have hitherto maintained their individuality. In colour they are light-brown, and have somewhat prominent features and long hair. They work at agriculture and cattle-rearing, and live together in villages, protected by thickets of bamboo stakes. The government is derived from the old Malay form, and is democratic in character. Each village has its raja, but his influence is great only in times of war. The real government is through popular assemblies, in which are often stormy scenes. Polygamy is permitted. The punishment for murderers, prisoners of war, adulterers, spies, and traitors is that they are eaten. Though surrounded by Mohammedans for centuries, the Battas revere the memory of their ancestors, and believe in wicked spirits, and in gods bearing not Malay but Indian names. The arts of reading and writing are widely spread. They possess an alphabet derived from old Indian characters, and a written literature (on bark or bamboo slips)—chiefly books on witchcraft, incantations, riddles, and stories.

Battenberg. The Hessian title Countess of Battenberg (from the small town, now Prussian, of Battenberg, in Hesse-Nassau) was conferred in 1851 on Prince Alexander of Hesse'smorganatic wife, the Russian Polish Countess Julia Theresa von Hauke (1825-95); and in 1858 she was made a princess. Fruits of that union were Prince Louis Alexander, Prince Alexander, and Prince Henry.

Prince Louis Alexander, born at Gratz, 24th May 1854, became naturalised, and entered the British navy in 1868. He married his cousin, Victoria, eldest daughter of Princess Alice (Queen Victoria's daughter), in 1884. Made a rear-admiral in 1904, he became First Sea Lord of the Admiralty in 1912, but resigned in 1914, when prejudice had been aroused against his birth. In 1917, at the king's request, he relinquished his German titles, assumed the surname of Mountbatten, and became a peer of the United Kingdom, with the title of Marquess of Milford Haven. Raised to the rank of Admiral of the Fleet in August 1921, he died on the 11th of September. He wrote a book on medals (1921).

Prince Alexander, born in 1857, chosen prince of Bulgaria in 1879, proclaimed the union of Eastern Rumelia with Bulgaria (1885) without consulting Russia, and thereby also provoked the jealousy of the Serbs, whom he defeated in a fortnight's campaign. But in August 1886 partisans of Russia overpowered him in his palace at Sofia, forced him to abdicate, and carried him off to Reni, in Russian territory. Set free in a few days, he returned; but after a futile attempt to conciliate the Tsar, he abdicated finally next month, and assuming the title of Count Hartenan, retired to Darmstadt. He died 17th February 1893. See BULGARIA.

Prince Henry, born at Milan, 5th October 1858, died at sea of fever caught in the Ashanti war, 20th January 1896. In 1885 he married the Princess Beatrice (born 14th April 1857), youngest daughter of Queen Victoria.

Battens, sawn fir timber, of smaller dimensions than the kind called planks. They are usually from 12 to 14 feet long, 7 inches broad, and 2½ inches thick. Cut into two boards, each 1½ inch thick, they are used for flooring; cut into three

boards, they are put on roofs below slates; in narrower pieces, they are put upright on walls for fixing the laths for plastering. The best battens are brought from Norway, and sold wholesale by wood-merchants.

Batter, in architecture, used as a noun and as a verb to express the manner in which walls, as those of towers, slope inwards. The walls of wharfs, and those built to support embankments and the like, usually batter.

Battering-ram, an engine of war used in ancient and medieval times. It consisted of a beam of wood, with a mass of bronze or iron on one end, resembling the head of a ram (Lat. *aries*). In its simplest form, it was borne and impelled by the hands of the soldiers; afterwards, it was suspended in a frame, and made to swing. Another form moved on rollers. The alternating motion was communicated by ropes. To protect those working it, a wooden roof (*testudo*) was constructed over it, and the whole was mounted on wheels. The beam of the ram varied from 60 to 120 feet in length, the head sometimes weighed above a ton, and as many as 100 men were employed in impelling the machine. When the blows were long enough continued, hardly any wall could resist. The Romans derived it from the Greeks. A battering-ram was used in Irish evictions in 1889-90.

Battersea, a metropolitan borough, on the Surrey side of the Thames, here crossed by the Chelsea, Albert, and Battersea bridges. In the parish church (1777) is a monument to the celebrated Lord Bolingbroke, who was born and died in a house close by. In Battersea Fields the Duke of Wellington fought a duel with Lord Winchelsea (1829). Battersea Park, 185 acres in area, was laid out in 1852-53; and the Albert Palace was opened in 1885. In 1899 Battersea became a metropolitan borough. The parliamentary borough (with two members) coincides, since 1918, with the metropolitan borough. Pop. 168,000.

Battery, a group of guns, whether field or siege, under the command of one immediate superior. A field or horse battery has 6 guns in all modern armies except the Russian, in which it has 8; but some armies are contemplating the reduction to 4 pieces, owing to the great power and rapidity of fire of the newest weapons. The term battery includes men, horses, and everything that takes the field as a unit; but is also used to designate the *personnel* only (see ARTILLERY). A fortified emplacement for guns is also called a battery. In foreign armies, garrison artillery are divided into battalions and companies; with us, into companies. These companies provide the *personnel* for certain types of battery (see BRIGADE, ARTILLERY). Batteries are divided into sections of 2 guns each, commanded by a subaltern. The captain has charge of the ammunition supply to the guns, and the battery is commanded by a major. (For *personnel*, &c., of the chief types of battery, see ARTILLERY.) About 50 rank and file per battery are armed with rifles, but have no bayonets. In the horse artillery all wear swords except 'drivers'; in the field artillery only officers and warrant-officers wear swords; in garrison artillery the gunners have rifles and short bayonets. In addition to the ammunition and the arms of the men, every horse and field battery also carries spare sights and other parts, fuses, tools, and small articles, besides stores for the artificers. When guns are grouped for siege purposes, they are placed in specially prepared works, fitted with platforms and provided with magazines. There are two types, the pit and the epaulement battery, the latter having the gun-wheels on the level of the natural ground. Each has a variety of forms, and is pro-

vided with thick earth cover in front and on a dangerous flank, traverses between guns to localise the effect of a shell-burst, overhead cover of beams and earth for magazines and stores and unemployed *personnel*, covered passages from gun to gun and from battery to battery. Concealment is, in modern warfare, reckoned of almost paramount importance, and emplacements are often sited on reverse slopes of hills, a score or more of feet below the intervening crest, so that even the flash of the discharge is invisible to the enemy; and, the powder being smokeless, the concealment is complete. When this kind of concealment is impracticable, various artifices are employed in screening. For electric batteries, see ELECTRICITY, DYNAMO-ELECTRIC MACHINES; for assault and battery, see ASSAULT.

Batthyanyi, one of the most powerful families of Hungary, traces its origin back to the Magyar invasion in 884 A.D., and has given to Hungary many distinguished warriors, statesmen, and churchmen.—Francis Batthyanyi distinguished himself at the battle of Mohacs in 1526; Balhazar fought with distinction in the Turkish wars of the 16th century.—Count Casimir (1807-54) was Minister of Foreign Affairs in Hungary during the insurrection in 1849, as well as military governor. After the catastrophe he fled with Kossuth into Turkish territory, whence in 1851 he went to France.—Count Louis (1809-49), belonging to another branch of the family, espoused the national cause, yet sought to maintain the connection with Austria and his allegiance to the Austrian sovereign. Appointed President of the Ministry in March 1848, he did not hold the office long, and afterwards, as a member of the diet, acted with great moderation. Yet after the Austrians entered Pesth, he was arrested and executed by sentence of martial law. His estates, valued at £400,000, were confiscated, but restored to his family in 1867; and in 1870 his body was removed and interred anew.—A Prince Batthyanyi (1803-83) occupied for forty-five years a prominent position on the turf, winning the Derby in 1876.

Battle, a town in Sussex, 6 miles NW. of Hastings, consists of one street. The uninhabited heathland of Senlac was renamed from the Battle of Hastings (q.v.), fought here on 14th October 1066. William, to commemorate his victory, founded in 1067, on the spot where Harold fell, a splendid Benedictine abbey. The probably fabulous roll of the Conqueror's barons deposited in it was said to have perished in the burning of Cowdray House in 1793; and the ten 'copies' extant have all been grossly tampered with. Pop. 3000.

Battle (Fr. *bataille*, akin to *battre*, 'to beat'), a hostile encounter or combat between opposing forces, whether on land or sea. In military operations the battle is the culminating effort of all the previous strategy, and the aim of a commander is to have available at this moment as much as possible of his own army against inferior strength of the enemy. If it is recognised that the enemy has entrenched, and intends to await attack, caution can be exercised by opening the engagements with tentative attacks along the front by comparatively small bodies of troops, but with supports and reserves of all arms as close up as is consistent with concealment. This action, though the commencement of the battle, is of the nature of a final reconnaissance, calculated to lay bare the shape of the enemy's dispositions, in order that the commander may use his masses in full knowledge. He will endeavour to retain the initiative by a continuous impulsion, and by striking his final and decisive blow in a direction and with numbers that will come as a surprise to the enemy. To accept battle on the defensive is usually an acknowledg-

ment of temporary inferiority, whether of quality or numbers. For the moment the defender renders himself, by skillful dispositions and entrenchment, the equal of the superior enemy, but cannot hope for decisive success in the campaign without becoming eventually the attacker. The latter has the advantage, material and moral, of having a definite plan, while the defender is largely confined to parrying blows. The attacker also, winning substantially at a single point, either has the victory or is on the road to it; the defender must be successful everywhere. In the infrequent 'encounter' battle, when both sides open by attack, quickness of decision is all-important.

Success in battle, apart from the value of numbers and of quality in the commander, depends on the moral of the troops, their state of tactical training, their physical condition, their confidence in their officers, the quality of their armament, the ability of the staff, and the continuous co-operation of all the arms and of all the units. In this co-operation the mutual relation of infantry and artillery is held in these days to be of supreme importance, and is assiduously studied in all modern armies. See STRATEGY, TACTICS, WAR.

For the tactics of sea-battles of the future, some guidance can be had from the combat of Tsushima in 1905 (Russia and Japan). The heaviest guns, the best gunnery, and tactics that brings one's gunners into the best light will win—this is the experience of the Great War, from battles of Jutland and Coronel and Falklands, abstraction being made of the spirit of chiefs and crews.

In the matter of casualties, eleven of Frederick the Great's battles showed an average of 14 per cent. In earlier battles, mostly of hand-to-hand character, casualties were apt to be very high. Until the Great War, their percentages seemed to be decreasing. Napoleon's battles showed great variety in this connection, from 8 per cent. at Bautzen (1813) to 24 at Waterloo and 28 at the Borodino. The Secession War in America (1861-65) showed high figures, while Sadowa and Gravelotte showed only 6 and 9 respectively. In the Great War battles were so like campaigns that comparative figures are hardly possible.

In most of these battles the fighting lasted only one day; the war in Manchuria (1904-5) showed that future great battles were more likely to last a week if, of two fairly equal enemies, one entrenched seriously. At Mukden, with over 400,000 on each side, there was continuous fighting for fourteen days and nights, the Russians suffering a loss of 140,000, plus 40,000 prisoners, or nearly 30 per cent. without prisoners; but the daily losses were only about 2 per cent. Eighty per cent. were hurt by machine-gun and rifle fire, 15 per cent. by artillery, 5 per cent. by cold steel, in modern battles, but in the Great War the artillery and the bayonet had higher figures. In the Great War the duration of battles took a leap upwards, so that some historians prefer to use the word campaigns. Thus the battle of Verdun, begun on 21st February 1916, only ended 5 months later, including the French counter-attacks at the end. In 1851—the year that was to inaugurate a universal peace—Sir Edward Creasy published *The Fifteen Decisive Battles of the World*, a title from which the emphatic 'The' might have well been omitted. His list is as follows: Marathon (490 B.C.), Syracuse (413 B.C.), Arbela (331 B.C.), Metaurus (207 B.C.), defeat of Varus (9 A.D.), Châlons (451), Tours (732), Hastings (1066), Orleans (1429), defeat of Spanish Armada (1588), Blenheim (1704), Pultowa (1709), Saratoga (1777), Valmy (1792), and Waterloo (1815). Actium (31 B.C.), Lepanto (1571), and Trafalgar (1805) might fairly have been included in the list; to which should be added Sadowa (1866), Sedan (1870), and perhaps

Mukden (1905). In the Great War the battles that decided phases on the Western front were: 1st Marne (Sept. 1914); 1st Ypres (Nov. 1914); 2d Ypres (April 1915); Verdun (Feb. 1916); 2d Marne (July 1918); 2d Somme (8th Aug. 1918); Cambrai (Sept. 1918).

Battle, WAGER OF. The Wager of Battle, or as it is sometimes called, Trial by Combat, was an ancient usage in English law which permitted the accused and accuser, in defect of sufficient direct evidence, to challenge each other to mortal combat, for issue of the dispute. It obtained in civil and criminal cases, and also in military matters, to which, indeed, it was more appropriate. It consisted of a personal combat between the parties in presence of the court itself, and was grounded on the idea of an appeal to Providence, the expectation being that Heaven would give the victory to the innocent or injured party.

In charges of treason, the wager of battle was occasionally resorted to. 'It seemeth,' says Coke, 'that by the ancient common law one accuser or witness was not sufficient to convict any person of high treason; for in that case, where is but one accuser, it shall be tried before the constable or marshal by combat, as by many records appeareth.' The court over which the constable or marshal presided was called the Court of Chivalry. When the Earl-marshal sat alone, it was a military court, or court of honour; when the Lord High Constable and the court sat conjointly, it was also a criminal court. The form and manner of waging battle in cases of treason were very elaborate, and attended by imposing ceremonies. (A full account of these will be found in Blackstone's *Commentaries*, book iv.) In *Richard II.* (I. iii.), in the quarrel between Norfolk and Bolingbroke, Shakespeare has preserved a perpetual record of this chivalrous solemnity.

In civil cases, the battle was waged by champions, and not by the parties themselves; but in criminal cases, the parties fought in person, unless the appellant were a woman, a priest, an infant, or a man of the age of sixty, or lame, or blind, all of whom might refuse the wager of battle, and compel a trial by jury. Commoners could not challenge peers of the realm to wage battle, on account of their personal dignity, nor, by special charter, could the citizens of London engage in trial by combat, fighting being considered foreign to their education and employment. Whether by champions or in person, the mode of proceeding was the same. The appellee, or defendant, as he might be called, threw down his glove, and declared that he would prove his right, or defend himself with his body. The appellant, or prosecutor, in accepting the challenge, took up the glove, and replied that he was ready to make good his appeal, body for body; and thereupon the parties, holding each other's hands, joined issue before the court in a very formal and solemn manner. The combatants were obliged to swear that neither of them would resort to sorcery or witchcraft. The battle might last till the stars appeared in the evening, and the party who by that time had either killed or got the better of his opponent, was considered the successful suitor of justice. In a charge of murder, if the accused was slain, it was taken as proof of his guilt, and his blood was attainted; if he was so far vanquished as not to be able or willing to fight any longer, he was adjudged guilty, and sentenced to be hanged immediately.

So late as the year 1818, this barbarous procedure was solemnly decided by the Court of King's Bench to be a valid and legal mode of trial, which the king's subjects were free to adopt. Of course, the principle was, that all laws, no matter how

unsuitable to the times, could be enforced, unless expressly repealed by act of parliament. The case is that of *Ashford v. Thornton*, and is reported in the first volume of *Barnwall and Alderson's Reports*, p. 405. As we have stated, the court decided in favour of the validity of the ordeal, one of the judges remarking that enough had not been stated to induce their lordships to refuse the battle, and another more plainly and unequivocally observed that the defendant was 'entitled to this his lawful mode of trial.' But Lord Ellenborough put the matter more clearly by stating that 'the general law of the land is in favour of the wager of battle, and it is our duty to pronounce the law as it is, and not as we may wish it to be; whatever prejudices, therefore, may justly exist against this mode of trial, still, as it is the law of the land, the court must pronounce judgment for it.' In this case, the man at the bar was charged with murder; and he threw down the glove in token that he challenged his accuser. The latter individual, however, declined, under legal advice, to take up the glove, and so the charge was departed from. In consequence of this case, the Act 59 Geo. III. chap. 46 was passed, by which the ordeal was wholly abolished.

In Scotland, the matter would have been differently disposed of; for the judges there, following the doctrine of the Roman law, would have held the proceeding to have been in desuetude and obsolete, and there the matter would have ended.

Montesquieu, in his *Spirit of Laws*, book xxviii., very ingeniously and plausibly deduces the modern practice of duelling and the so-called laws of honour from the above form of judicial combat. See *ORDEAL*; and Geo. Neilson, *Trial by Combat* (1890).

Battle-axe was a weapon much used by the early northern nations, Celtic and Scandinavian, requiring great strength in its use. Some were held with one hand, some with two; the former kind could be wielded equally by horse and foot, but the latter was for foot-soldiers only. The battle-axe had a longer handle, and a broader, stronger, and sharper blade than the common axe. During the middle ages, and somewhat earlier, it was much used in sorties, and to prevent the escalading of a besieged fortress. The *pole-axe* differed but little from the battle-axe. The *black bill* and *brown bill* resembled a halbert, having the cutting part hooked like a woodman's bill, with a spike projecting from the back, and another from the head. *Glaive*, usually a sword, was sometimes applied to a kind of pole-axe or bill used by the Welsh. The *francisca* of the Franks was hurled as a missile. See *HALBERT*, *LOCHABER AXE*.

Battle Creek, a thriving city of Michigan, on the Kalamazoo River, and at the junction of several railways, 45 miles SW. of Lansing. It is the headquarters of the Seventh-Day Adventists, and manufactures machines and agricultural implements. Pop. 36,000.

Battleford, a town of Saskatchewan Province, Canada, is situated at the junction of the Battle River with the Saskatchewan, and connected by rail with Winnipeg and the Canadian Pacific Railway at Calgary. The capital of the North-west Territories from 1876 to 1883, it lost importance and population when the seat of government was transferred to Regina; but it remains the prosperous centre of a fertile farming district. Pop. 1200.

Battlement (Fr. *bâtiment*, 'building'), a notched or indented parapet formed by a series of rising parts called *cops* or *merlons*, separated by embrasures or openings called *crenelles*. Battlements were intended to enable the soldier to shelter himself behind the merlon, whilst he shot

through the embrasure. Originally military, they became freely used for architectural effect in other

Simple form of Battlement.

buildings. In churches, the battlements are frequently pierced with circles or trefoils.

Battleship. See *NAVY*.

Battue (from Fr. *battre*, 'to beat'), a word less used by real sportsmen than by writers on sport. The *battue* is a method of killing game on a great scale, by causing animals to be driven forward to a point where a number of guns are posted. The driving is effected by beating the bushes; hence the term *battue*. The word occurs in a letter of Matthew Gregory Lewis in 1804; but, according to Cobden, the *battue* was unknown in 1790. Certainly, as it is practised to-day, it is quite modern; though a plan of killing deer by driving them forward in herds in an ever-narrowing circle to a place where they are to be shot is an old usage in the Highlands, where it is called the *tinchel* (Gael *timcheoll*, 'circuit'). It is practised chiefly in extensive preserves of pheasants and hares during the autumn and winter months, when country gentlemen invite acquaintances to their houses for the sake of field-sports. The *battue* takes place early in the day; the number of men is usually eight or ten, each provided with at least two guns, which are loaded by an assistant as soon as they are discharged. When the guns are stationed at safe distances from each other, and ready to commence work, the beaters begin theirs by driving the game before them. Sometimes, however, pheasants will run a long way before taking to the wing, and to make them rise on approaching the guns a low net is occasionally stretched across their path. It should be stated, however, that in the *battue*, hares, rabbits, &c. are shot as readily as pheasants; and at length the ground is covered with slain, like a field of battle. Big bags date from 1860, the first to startle the shooting world in this respect being the Maharaja Dhuleep Singh, then of Elveden Hall, Suffolk.

Battus, according to legend the founder of the Greek colony of Cyrene in Libya (c. 630 B.C.), a native of Thera.

Batu, a group of islands in the Netherlands Indies, off the W. coast of Sumatra.

Batum, or *BATOUM*, a town of Transcaucasia, on the eastern shore of the Black Sea, 201 miles W. of Tiflis, and 575 of Baku, by a railway completed in 1883, is claimed by Georgia and Armenia. The Berlin Congress of 1878, in sanctioning the cession of Batum by Turkey to Russia, stipulated that it should not be made into a naval station, but should remain an essentially commercial port. None the less the Russians rendered it a second Sebastopol, and in 1886 withdrew its privileges as a free port. The harbour is one of the best on the east coast of the Black Sea. A pipe-line carries oil from Baku; other exports are wool, grain, manganese ore, copper, cocoons and raw silk, carpets, liquorice-root. The place has been vastly improved since 1878. The marshy country around it has been drained. Pop. 45,000. Batum was founded as Petra by one of Justinian's generals early in the 6th century A.D., and figures as Vati in the middle ages.

Batuta. See IBN BATUTA.

Batz, BARON DE, an audacious royalist, who under the revolution plotted to carry off the king and to rescue the queen, corrupted members of the Convention, and created universal fear of foreign intrigue. In 1815 he was nominated a field-marshal, and he died in 1819. See a book by Lenôtre (1910).

Baucis. See PHILEMON.

Baudelaire, CHARLES, born at Paris on the 21st April 1821, after a voyage to India became a notable figure in the second group of Romantic poets who carried on the movement begun by the Romantics of 1830. His *Fleurs du Mal*, a volume of poems issued in 1857, was the subject of a prosecution on the score of immorality, and had to undergo expurgation. He afterwards published *Les Paradis artificiels, Opium et Haschisch*, a work partly original, partly composed of selections, admirably translated, from Poe and De Quincey. His occasional essays, collected in *L'Art romantique*, are remarkable for the finish of the style and the subtlety of the criticism. Apart from his verse, however, Baudelaire's finest work is contained in his fifty *Petits Poèmes en Prose*. All of these are exquisitely written, and in many of them the beauty of the thought is equal to the beauty of the language. Financially ruined and stricken with paralysis, the penalty of excess, Baudelaire died in Paris 31st August 1867. He was neither a prolific nor a popular writer, and he too often misapplied his incisive intellect to repulsive subjects. He united a remarkably keen analytic faculty with a powerful, sombre imagination. Brooding melancholy, curiously tinged with irony, inspires the solemn music and dream-like imagery of his best verses. He was the 'father' of the decadent symbolist school.

See his *Œuvres Complètes* (7 vols. 1868-70) and *Œuvres Posthumes* (1903); Henry James's *French Poets and Novelists* (1882); and monographs by Gautier (1903), Crépét (1887; enlarged 1919), Séché (1910), Tournachon (1911), Nadar (1911), Turquet Milnes (1913), and Symons (1921); T. Gautier's *Life* (trans. 1915).

Baudry, PAUL (1828-86), a French painter, was born at La Roche-sur-Yon, and studied in Paris and Rome. Among his best-known works are 'Punishment of a Vestal Virgin' (1857) and the 'Assassination of Marat' (1867). He was for ten years employed in decorating the foyer of the Grand Opéra in Paris. See J. C. Van Dyke, *Modern French Masters* (1896).

Bauer, BRUNO, biblical critic, was born at Eisenberg, in Saxe-Altenburg, 9th September 1809. After his studies at Berlin, he became a *privat-docent* in the university there, and in 1839 at Bonn; but three years later he was forbidden to deliver any more theological lectures. He then removed to Berlin, and busied himself there with incessant writing of a more or less violent and polemical description on theological and political subjects, until his death at Rixdorf, near Berlin, 18th April 1882. At first an adherent of the young Hegelian school, Bauer in his earlier works explained the Christian religion as substantial truth obscured by the accretions of a confused and erroneous system of interpretation. In his books on John and the Synoptic Gospels, published in 1840-42, he maintained that the gospels were in no sense historical, but merely artistic products of the human self-consciousness. These books brought him into embittered controversies, which impelled him to retorts that were often both violent and vulgar. His pamphlet against the emancipation of the Jews, in 1843, marked the beginning of a reaction against liberalism, and from this time he abandoned theology for some years, and employed himself as a publicist and *littérateur*. He wrote

numerous historical works on the 18th century, in which he tries to show that the failure of the popular and national struggles in the 19th century was a result of the essential weakness of the 'enlightenment' of the 18th. Later he returned to his earlier studies, and alternated books of destructive criticism on the gospels, the Acts of the Apostles, and the Pauline epistles, with defences of Prussian conservatism. His latest work, published in the year of his death, contrasted the imperialism of Disraeli and Bismarck. See A. Schweitzer, *Quest of the Historic Jesus* (trans. 1910).

Bauer, CAROLINE, a German actress, born at Heidelberg in 1807, made her début in 1822, and had achieved a brilliant success, in comedy and tragedy alike, when in 1829 she married Prince Leopold, afterwards king of the Belgians. Their morganatic union was as brief as it was unhappy; in 1831 she returned to the stage, which she quitted only in 1844, on her marriage to a Polish count. She died at Zürich, 18th October 1878. Her posthumous *Memoirs* (Eng. trans. 1884), with their denunciations of Prince Leopold and Baron Stockmar, offer a striking contrast to the two bright volumes of theatrical reminiscences that had preceded them in 1871 and 1875.

Bauhinia, a genus of Leguminosae, sub-order Caesalpineeae. The leaves are generally divided into two lobes, which led Plumier to name this genus in memory of the united labours of the brothers John and Caspar Bauhin, two botanists of the early part of the 17th century. The species are natives of the warmer regions of both hemispheres, and some of them are remarkable for the size and beauty of their flowers. Most of them are twining plants, or *lianas*, stretching from tree to tree in the tropical forests, such as *B. vahlii*, the Maloo Climber of India, which may attain a length of 300 feet, at once smothering the highest tree-tops and strangling the stems below; but some are small trees, as *B. porrecta*, the Mountain Ebony of Jamaica, so called from the colour of its wood. The inner bark of several East Indian species is employed for making ropes; that of the Maloo Climber being employed for making suspension bridges on account of its extreme toughness. *B. retusa* and *B. emarginata*, also East Indian, exude a brownish coloured mild gum; whilst the astringent bark of *B. variegata* is used in Malabar for tanning and dyeing leather, and also in medicine; it also yields an ebony. The leaves of various species are used in Brazil as demulcent medicines, having mucilaginous properties.—Livingstone mentions a species of bauhinia in South Africa, called the Mopané Tree. It is remarkable for the little shade which its leaves afford. They fold together, and stand nearly erect during the heat of the day. On them the larvæ of a species of *Psylla* cause a saccharine secretion, in circular patches, beneath which the pupa of the insect is found. The natives scrape it off, and eat it as a dainty.

Baumgarten, ALEXANDER GOTTLIEB, a clear and acute thinker of the school of Wolf, was born at Berlin on the 17th of July 1714, studied at Halle, and in 1740 became professor of Philosophy at Frankfort-on-the-Oder, where he died on the 26th of May 1762. He is the founder of *Æsthetics* (q.v.) as a systematic science of the beautiful and an integral part of philosophy. In 1750-58 he issued two volumes of his *Æsthetica*, but his death hindered the completion of the work. His writings in other departments of philosophy are marked by clearness and precision. He carried the dogmatic, rationalistic system of Wolf to its utmost development; his *Metaphysica* (Halle, 1739; 7th ed. 1779) is one of the most useful books for the study of the Wolfian philosophy. He also wrote *Philo-*

sophia Generalis (published 1770), *Ethica* (1740), *Jus Naturæ* (1765). See Joh. Schmidt's *Leibnitz und Baumgarten* (Halle, 1874).

Baumgarten-Crusius, LUDWIG FRIEDRICH OTTO, a German theologian, born at Merseburg, 1788. He studied theology at Leipzig, became in 1810 university preacher there, and in 1817 professor of Theology at Jena, where he died, May 31, 1843. As a theologian, he showed a semi-rationalistic tendency, from which, however, he was saved by a yet more powerful influence—a spiritual affinity with Schleiermacher. His best work is in the region of the history of dogma. His chief works are *Lehrbuch der Christlichen Sittenlehre* (1827), *Lehrbuch der Christlichen Dogmengeschichte* (2 vols. 1831–32), *Kompendium der Christlichen Dogmengeschichte* (2 vols. 1840–46), the last—completed from his notes by Hase—perhaps his best book.

Baur, FERDINAND CHRISTIAN, was one of the most eminent and influential of modern German theologians. It has not unjustly been said of him that he was for the criticism of the New Testament what Wolf and Niebuhr were for classical literature and history. Baur was born at Schmiden, near Stuttgart, on the 21st June 1792, became professor in the theological seminary at Blaubeuren in 1817, and was called to the university of Tübingen as professor of Theology in 1826. In his work here he spent a most laborious life, being known as the founder of the 'Tübingen School,' and at Tübingen he died 2d December 1860.

His first publication, *Symbolik und Mythologie* (1825), expounded the nature-religion of antiquity; but the main work of his life lay in the fields of church history, the history of Christian dogma, and biblical criticism. Originally a disciple of Schleiermacher, he early attached himself to the school of Hegel, and the Hegelian conception of history he in the main continued to hold from the time he published his books on Manichæism (1831) and Gnosticism (1835) till the end of his life. Of much greater importance than these were his elaborate works on *The Christian Doctrine of the Atonement* (1838) and the *Trinity and Incarnation* (1843). The *Handbook of the History of Christian Dogma* was followed by three volumes of *Lectures on the same subject*. His famous *Contrast between Catholicism and Protestantism* (1836) was written in reply to the *Symbolik* of the Catholic theologian, Mohler.

Baur's article on the 'Christ-party in the Corinthian Church,' contributed to the *Tübinger Zeitschrift* for 1831, may be said to have first indicated that conception of the early Christian Church with which his name is identified, and which in a long series of works he has compelled all subsequent writers on this period either to accept in whole or in part, or explicitly to refute. The current view of the early church was that in it peace, concord, and unity prevailed. But from a careful study of the New Testament and patristic literature, Baur came to a different conclusion. The most ancient Christianity, it seemed to him, stood very near to Judaism, the Christianity of the congregation in Jerusalem and the apostles there. Paul was the first to free the new faith from this narrowness, but the majority of the Jewish Christians and the apostles were unable to adopt Paul's wider view of the scope and mission of Christianity, and opposed it at times with passionate hostility. The Judaistic or Ebionite party long maintained the supremacy in the church, their creed differing from Judaism mainly in the belief that Jesus was the Messiah, and it was not till long after Paul's death, and mainly during the Gnostic controversies about or after the middle of the 2d century, that the contending parties were

welded together into the Catholic Church, by help of the dogmatic system of the fourth gospel, and the episcopal constitution of the church. The various stages of the process of fusion are, in Baur's belief, marked by extant documents, both amongst the books of the New Testament and in extra-canonical literature. Most of the New Testament books Baur held to have been written in the 2d century. Of Paul's epistles he accepted as genuine only those to the Romans, Corinthians (I. and II.), and Galatians; and only these genuine epistles of Paul, and the Apocalypse representing the opposite or Judaistic extreme, seemed to Baur to have been written before the year 70 A.D. The Acts of the Apostles minimised the hostilities that rent the early church, and the highest outcome of the conciliating tendency was the Gospel of John, which was of course not by the apostle, but by a writer of the 2d century. These views are developed with vast learning, ingenuity, and brilliancy of criticism in *Paul, the Apostle of Jesus Christ* (2d ed. 1867; Eng. trans. 1873–75); *Critical Investigations on the Canonical Gospels*; the *Gospel of Mark*; and *Christianity and the Christian Church of the first Three Centuries* (3d ed. 1863; Eng. trans. 1879). The later periods of church history Baur treated in four separate works—on the church from the 4th to the end of the 6th century; the church of the middle ages; the church of modern times; and the church of the 19th century. The most distinguished of those who adopted Baur's view of the early church of the leaders of the Tübingen School were Zeller, Schwegler, Kostlin, and Hilgenfeld, their principal organ being the *Theologische Jahrbücher* (published from 1842 to 1857). But Baur's disciples were very numerous, and his influence was marked on many who could not be said to belong to the school. Many of the contentions of Baur and his earlier followers have been modified by the later representatives of Baur's view; but of the school as a whole, it may be said that its leaders were the first to bring to bear on the doctrine, constitution, and literature of the early church the strict scientific methods adopted by dispassionate workers in other departments of historical research. It should be noted that Baur's main position was to some extent anticipated by Semler, and also by the English deists, Thomas Morgan and John Toland.

See R. Mackay's *Tübingen School* (1863), Zeller's *Vorträge und Abhandlungen* (2d ed. 1875), and Schmidt and Haussleiter on Baur in the *Hauck-Herzog Realencyklopadie* (1896–1909).

Bautain, LOUIS EUGÈNE-MARIE, a French philosopher and theologian, born at Paris, February 17, 1796. A pupil of Cousin, he became in 1816 professor of Philosophy in the College of Strasbourg. He took orders in 1828, but was much harassed by charges of heterodoxy discovered in his writings, and at one time was even suspended from his sacred function for some years. In 1848 he was appointed vicar-general of the diocese of Paris, and in 1853 a professor of the Theological Faculty. He died at Paris 18th October 1867. Besides being a very popular preacher, he wrote several philosophical books, among them *Psychologie Expérimentale* (1839), *Philosophie Morale* (1842), *La Religion et la Liberté* (1848), *La Morale de l'Évangile* (1855), and *Philosophie des Lois* (1860).

Bautzen (Wendish *Budissin*), an important manufacturing town in Saxony, situated on a rising ground overlooking the river Spree, 35 miles W. of Görlitz by rail. It is the chief town of an administrative district of the same name, which has a population of 433,000, including some 50,000 *Wends*, remnants of the old Slavic population of

eastern Germany. The chief buildings are a former cathedral (1497), and the castle of Ortenburg, dating from 958, and a frequent residence of the kings of Bohemia. The leading industries are manufactures of woollens, fustian, linen, hosiery, leather, and explosives. Pop. 35,000. Bautzen was first made a town under Otto I. It suffered greatly in the war with the Hussites, and still more during the Thirty Years' War. Here Napoleon, after an obstinate resistance, won a barren victory over Russians and Prussians, May 20-21, 1813.

Bauxite, the principal ore of Aluminium (q.v.), is so named from Les Baux, near Arles, where it was first found. It is a hydrous oxide ($Al_2O_3 \cdot 2H_2O$) generally with oxide of iron, white, brown, or red, occurring in earthy or concretionary masses in northern France, the United States, British Guiana, Ireland, and elsewhere. See BRICKS.

Bavaria (Ger. *Bayern*), second in area and population of the states of the German commonwealth, is divided into two unequal parts, the Palatinate (Rheinpfalz) being separated by Baden and Hesse from the rest of the state, which is surrounded by Prussia, Thuringia, Saxony, Bohemia, Upper Austria, Salzburg, Tyrol, Vorarlberg, Württemberg, Baden, and Hesse. Bavaria is divided into eight districts, as follows:

Districts.	Area in sq. miles.	Pop in 1919.
Upper Bavaria.....	6489	1,584,902
Lower Bavaria.....	4148	740,663
Palatinate.....	2288	957,348
Upper Palatinate.....	8727	612,521
Upper Franconia.....	2910	729,715
Middle Franconia.....	2930	949,874
Lower Franconia.....	3252	783,343
Swabia and Neuburg.....	3804	886,798
Total.....	29,498	7,150,833

This table includes under Upper Franconia the Coburg territory, and under Lower Franconia the Königsberg territory, of the free state of Coburg, which united with Bavaria in 1920. 160 sq. miles of the Palatinate (with 96,000 inhabitants) came under the Saar basin administration in 1919. Munich, the capital, has 620,000 inhabitants, Nuremberg over 350,000, Augsburg over 150,000.

Bavaria is walled in on S. and N.E. by mountains (Bavarian Alps, Bohmerwald, Fichtelwald, and Frankenwald), ranging from 3000 feet to close on 10,000 feet in height. The Zugspitze of the Norie Alps (9730 feet) is the highest peak in Germany. The interior is intersected in several directions by various less elevated ranges, alternating with extensive plains and fertile valleys. One-third of the country is covered with forests, mostly pine and fir.

The Rhine flows along the eastern boundary of the Palatinate. The Danube enters Bavaria proper at Ulm, and passes out at Passau into Austria. Including its windings, the length of the Danube in Bavaria is about 270 miles, which can be navigated throughout. The north part of the state is in the basin of the Main. In the south are many beautiful lakes—Ammer See, Starnberger See, Walchen See, Tegern See, Chiem See, Königs See, &c. The lakes and rivers abound in fish. The *Ludwigs-Kanal* unites the Main and Altmühl, and through them the Rhine and Danube, and so the German Ocean with the Black Sea.

Climate, Soil, Products, &c.—The temperature of Bavaria varies considerably, but the climate may be described generally as mild and salubrious. The soil is very fertile, and the wealth of the country consists almost wholly of its agricultural produce. The chief crops are hay and other fodder, rye, oats, barley, wheat, and potatoes. The land is mostly cultivated by peasant proprietors. The plain south of Munich has been described as the granary of Germany, while the districts of Upper and Middle Franconia are styled the hop-garden of Bavaria.

The vine is cultivated extensively in Rheinpfalz and Lower Franconia, and the wine is held in great esteem. The quantity annually produced in Bavaria is estimated at 15,000,000 to 16,000,000 gallons. Cattle-rearing forms the exclusive occupation of the inhabitants on the slopes and at the foot of the Alps. The forests of Bavaria annually furnish large quantities of timber. The chief minerals are salt, coal, and iron, which is worked almost everywhere throughout the territory.

Manufactures, &c.—The manufacture of beer is carried to great perfection in Bavaria, and to an extent unparalleled in Europe. Nearly two-thirds of the revenue of the state used to be derived from this source alone, which belongs now to the central government. Other industries are concentrated at Nuremberg, Augsburg, and the Palatinate towns, the chief manufactures being coarse linens and woollens, silk, ribbons, china and glass, shoes, gloves, iron goods, firearms, toys, paper, articles of straw and wood, nails, needles, jewellery, chemicals, beetroot, sugar, and tobacco. The mathematical, optical, and musical instruments of Munich are held in high repute. The position of Bavaria gives it a large transit-trade.

Population.—The population of Bavaria has increased more slowly than that of other German states, thanks largely to an old law that no marriage should take place without the sanction of the public authorities, the guardians of the poor requiring to be satisfied that the contracting parties possessed sufficient means to support a family. This law restricted marriage, and also caused an abnormally high illegitimate birth-rate. In 1855 the population was 4,541,556, an increase of 1,000,000 in forty years. By 1890 it was 5,594,982; by 1900, 6,176,057. In the 20th century the rate of increase has risen substantially, being 1.12 per annum as against .51 in 1885. The illegitimate birth-rate has correspondingly decreased. In 1859 such births were 23.6 per cent. of the whole; in 1912 they were 12.6. Infantile mortality in Bavaria, although greatly reduced in recent years, is still the highest in Germany. The Bavarians, notwithstanding their beer-bibbing propensity, are essentially a sober and industrious people. In Franconia the people are mainly descended from the Frankish stock, in Swabia from the Allemannian; while the old Bavarian stock is represented in the districts of Upper and Lower Bavaria and in the Upper Palatinate. Nearly 2 per cent. of the population are not of German birth. Agriculture accounts for two-fifths of the population, industry one-third, and trade one-ninth. Every year 600,000 foreign labourers have to be imported for the fields, roads, and railways.

Religion.—In 1910 the Roman Catholics numbered 4,862,000; Protestants, 1,942,000; Jews, 55,000; Old Catholics, 5800. Protestants dominate in the Rhenish Palatinate, Middle and Upper Franconia. The state allows perfect freedom, guaranteeing the same rights to all religions. Church and state are separated. There are 2 Roman Catholic archbishoprics (Munich and Bamberg) and 6 bishoprics.

Bavaria has a good system of *education*, under the supreme direction of a minister of public instruction. The universities of Munich and Würzburg are Roman Catholic, of Erlangen Protestant. There are several extensive libraries, that of Munich being one of the largest in Germany. Art has been zealously cultivated, and since the days of King Ludwig I. has been peculiarly fostered by the state. There are numerous institutions for the furtherance of painting, sculpture, and music. In particular, Munich picture and sculpture galleries, Baireuth, and the Oberammergau Passion-play, bear witness to Bavaria's love of art.

Government.—Bavaria till 1918 was a constitutional kingdom, the throne hereditary in the male line. Its constitution dated from 1818, when it was declared a part of confederated Germany. The revolution of November 1918 set up a republic of Bavaria, a federal state of the German republic. After the murder of the leading revolutionary, Kurt Eisner, and an experiment in Communism, overthrown by military pressure from Prussia and Wurttemberg, Bavaria adopted a constitution in 1919. The 'Freistaat Bayern' has a single-chamber diet, elected for four years by all Bavarian citizens (male and female) of twenty-three years. The suffrage is equal, direct, and secret. Proportional representation is in use. There is one member for every 40,000 inhabitants. The ministry as a whole exercises supreme executive power, and is set up by and responsible to the diet. When Bavaria in 1870 became one of the states of the German empire, she still retained certain independent privileges, including control of the army in time of peace, and of posts and telegraphs. These with the state railways have been handed over to the central government (1919-20).

History.—The Boii, a race of Celtic origin, appear to have conquered the country about 600 B.C., and they retained it until shortly before the Christian era, when they were subjugated by the Romans. After the decay of the Roman power the Ostrogoths and Franks successively held possession of it, and it was a part of Charlemagne's empire. In 1180 it was transferred by imperial grant to Otho, Count of Wittelsbach. The Rhenish Palatinate was conferred on this family by the Emperor Frederick III. in 1216. Now followed quarrels between relatives, and divisions of territory, until the dukedom of Bavaria was severed from the Rhenish and Upper Palatinate (see PALATINATE); of the latter, however, it repossessed itself in 1621—the peace of Westphalia, in 1648, confirming the title of its princes to that possession, as well as its right to the electoral dignity, to which it had been raised in 1624. In the War of the Spanish Succession Bavaria supported France, and suffered considerably in consequence; but in 1777, on the extinction of the younger Wittelsbach line, it received the accession of the Rhenish Palatinate. In 1805 Bavaria was erected into a kingdom by Napoleon I. The king assisted Napoleon in his wars, and in consideration of his aid received large additions of territory. In 1813, however, the Bavarian king contrived to change sides opportunely, and thus managed to have confirmed to him, by the treaties of 1814-15, an extent of territory nearly as valuable as the possessions which the treaties of Presburg and Vienna had given him, and which he had now to restore to Austria. In 1818 a new constitution was granted.

In 1825 Ludwig I. ascended the throne. He was a well-meaning, liberal, and intellectual monarch; but he lavished the wealth of the kingdom to an extravagant degree on the embellishment of the capital, and on works of art, while neglecting works of practical value. The restriction of the freedom of the press, following the French revolution of 1830, excited so much opposition that it was soon after rescinded; but fresh dissatisfaction was created by the imposition of new taxes. The Jesuits now obtained an immense influence with the king, which they used to the detriment of popular rights. The wrath of the people was further aroused against their monarch by his connection with the notorious Lola Montez (q.v.), who for a time wielded great influence in the state. In March 1848, following the example set by the French revolutionists, the people of Munich seized the arsenal, and demanded reforms and the expulsion of Lola Montez. The king had to consent; but in the

same month he abdicated. His son, Maximilian II., ascended the throne. He died in 1864, and was succeeded by his son, Ludwig II. In the war between Austria and Prussia in 1866 Bavaria took the Austrian side, and after the short struggle had to pay Prussia 30 million florins (£3,000,000), and to cede some small strips of territory. It also made a defensive and offensive alliance with Prussia; and in the struggle which followed between the party which aimed at bringing Bavaria into closer and friendlier relations with Prussia and the Ultramontane or 'Patriotic' party, the former had on the whole the best of it. Munich was the main centre of the Old Catholic (q.v.) movement. On the outbreak of the Franco-German war in 1870, Bavaria put its army under the command of the Prussian Crown Prince; and the Bavarian troops took a distinguished part in the battles of Weissenburg, Worth, Sedan, before Paris, and on the Loire. In November 1870 the government agreed, on the granting of certain concessions, to become part of the German empire; and a month later it was the king of Bavaria who, at Versailles, proposed that the imperial crown should be conferred on the Prussian king. Thenceforward the struggle between liberals and Ultramontanes proceeded with varying success. King Ludwig carried his grandfather's love of art and music to excess; he finally went mad, and committed suicide by drowning, June 13, 1886. He should be remembered less for his artistic extravagances than for his generous patronage of the great composer Wagner. He was succeeded by his brother, Otho (also insane), under the regency of his uncle, Prince Luitpold (1821-1912), and of his cousin, Prince Ludwig (born 1845), who, empowered to terminate the regency, became king in 1913, reigned till the revolution of 1918 (see above), and died in 1921. See GERMANY.

Bax, ERNEST BELFORT, born at Leamington in 1854, became a barrister and one of the founders of English Socialism, at first with William Morris in the Socialist League, afterwards in the Social Democratic Federation. He has written much on Socialism, on Marat and the French Revolution, on the German Peasants' War and the Anabaptists, on Kant, and on the history of philosophy.

Baxter, JOHN (1781-1858), book-seller and printer at Lewes, was the first to use the inking-roller, and produced the illustrated and annotated 'Baxter's Bible.'—His son, GEORGE (1804-67), was the inventor of oil-colour printing, and produced a set of famous prints.

Baxter, RICHARD, was born 12th November 1615, at Rowton in Shropshire, and as his father had squandered his property in gambling, his education was irregular. After a brief trial of a court life, deepening religious impressions led to his entering the ministry, though in very delicate health, when he was about twenty-three years of age. He was ordained by the Bishop of Worcester, and entered on the mastership of Dudley grammar-school, preaching occasionally. After a year he went as assistant to a clergyman in Bridgnorth, where he laboured for nearly two years. Originally, like his family and friends, an unhesitating conformist, he about this time found himself led by study of the controversial points to adopt some of the nonconformist views. In 1640 he was invited to officiate for the vicar of Kidderminster, where he remained for other two years. When the civil war broke out in 1642, he found his political views at variance with the public feeling of Worcestershire, and, some disorder arising, he retired to Coventry, where he ministered for two years to the garrison and inhabitants. His sympathies were almost wholly with the Puritans,

and after the victory of Naseby he acted as chaplain to one of the regiments, and was present at the sieges of Bridgewater, Bristol, Exeter, and Worcester. Whilst with the army, he employed all his eloquence to moderate the extreme views, political and religious, of the soldiers, and with considerable success. His health continuing very uncertain, he retired from the army to the house of his friend, Sir Thomas Rouse, of Rouse-Lench, Worcestershire; and here, 'in continual expectation of death, with one foot in the grave,' he wrote the first part of the best of all his works, *The Saints' Everlasting Rest*, published in 1650. On the invitation of his former parishioners, he returned to Kidderminster, and, in spite of continued bad health, laboured there for fourteen years with eminent success. 'When I came,' he says, 'there was about one family in a street that worshipped God, and when I came away there were some streets where there was not one poor family that did not do so.' At the Restoration, Baxter was appointed one of the king's chaplains, and took a leading part in the Savoy Conference. Presbyterian though he was, he did not object to a modified form of Episcopacy; yet he declined the proffered bishopric of Hereford. Shortly afterwards, in 1662, the Act of Uniformity having driven him out of the English church, he was compelled to leave Kidderminster, and was subjected to much hardship and persecution. Retiring to Acton, in Middlesex, in 1663, he spent the greater part of nine years chiefly in the composition of some of the most important of his works. The Act of Indulgence in 1672 permitted him to return to London, where he divided his time between preaching and writing. But in 1685, after the accession of James II., he was brought, for alleged seditious in his Paraphrase of the New Testament, before Judge Jeffreys, who treated him in the most brutal manner, calling him a dog, and swearing it would be no more than justice to whip such a villain through the city. Condemned to pay 500 marks, and to be imprisoned till the fine was paid, he lay in King's Bench Prison for nearly eighteen months, and was released only on the mediation of Lord Powis. The later years of his life were spent in tranquillity. He died on the 8th December 1691, in the seventy-fifth year of his age.

Baxter was a large-hearted man, and though a keen controversialist, had greater tolerance for the persons of those who were opposed to him than was common in those days. He was one of the ablest and most eloquent preachers of his time, and a most voluminous writer. His style is direct and manly; 'there is a vigorous pulse in his writings that keeps the reader awake and attentive,' and in his practical works he is intensely in earnest. Of these, *The Saints' Everlasting Rest* (1650), *Now or Never* (1663), *Call to the Unconverted* (1657), and *The Reformed Pastor* (1656) are the best known. His theological works, such as *Methodus Theologicæ*, *Catholic Theology*, and controversial works, are learned and profound, but are for the learned only. His theological catholicity and tolerance led some to regard him as an Arminian, while by others he was held to be a Calvinist. It was said of his works by Dr Isaac Barrow, with pardonable exaggeration, that 'his practical writings were never mended, and his controversial seldom confuted.' The few poems he has left are of considerable merit. The chief authority for his life is the remarkable and interesting autobiographical work published in 1696 as *Reliquiæ Baxterianæ*.

An edition of his practical works in 23 vols., with a Life by Orme, was published in 1830. Editions of select practical works appeared in 1830 and 1840. Recent shorter Lives are those by Dean Boyle (1883) and Davies (1886).

Bay is properly applied to an indentation of the sea into the land, with an opening wider than the depth. A gulf is understood to be deeper than a bay, and has often a narrow opening. These terms are often loosely applied; Baffin Bay, e.g., is really a gulf. When the body of water is large, and the entrance narrow, it becomes a shut sea, as the Baltic, the Red Sea, &c. Hudson Bay, the Persian Gulf, and the Gulf of Mexico, might with propriety be termed seas.

Bay, a name given to a number of trees and shrubs more or less resembling the Laurel or Victor's Laurel (*Laurus nobilis*), which is also called Sweet Bay (see LAUREL); the name *Bay* (Fr. *baise*, from Lat. *bacca*, 'berries'), which was once exclusively applied to the fruit, having been extended to the whole plant. The larger-leaved hardy evergreen common in shrubberies, the Common Laurel or Cherry Laurel (*Prunus Laurocerasus*), is sometimes called Bay Laurel. The true bay-leaves are frequently used for flavouring puddings,

Sweet Bay (*Laurus nobilis*).

&c.; but those of the laurel are sometimes substituted. The fumes of prussic acid given off by the latter when bruised are used by entomologists in killing butterflies and moths. Bay-rum, used by perfumers, is an aromatic liquid obtained by distilling rum in which bay-leaves have been steeped.—The RED BAY of the Southern States of America is *Laurus Caroliniensis* (see LAUREL).—The WHITE BAY of America is *Magnolia glauca* (see MAGNOLIA), and the LOBLOLLY BAY of the same country is *Gordonia Lasianthus*. See GORDONIA.

Bay-leaves with other evergreens decked houses at Christmas, were used at weddings, and were worn against thunder. The withering of bay-trees was reckoned a prognostic of evil. This is alluded to in Shakespeare's *Richard II.* (II. iv.), who is here quoting from Holinshed. The following passage occurs in Parkinson's *Garden of Flowers* (1629): 'The bay-leaves are of as necessary use as any other in the garden or orchard, for they serve both for pleasure and profit, both for ornament and for use, both for honest civil uses and for physic, yea, both for the sick and for the sound, both for the living and the dead; . . . so that from the cradle to the grave we have still use of it, we have still need of it.'

Bayas. See WEAVER-BIRD.

Bayaderes. See DANCING; NAUTCH GIRLS.

Bayam'o, or SAN SALVADOR, an inland town in the east of Cuba, in a fertile and healthy district on the north slope of the Sierra Maestra; pop. 5000.

Bayana, or BIANA, a town of the Rajput state of Bharatpur, 50 miles SW. of Agra, was one of the most famous forts in India. There are many temples, and the whole ridge of the hill is covered with remains of large buildings. Pop. 5000.

Bayard, JAMES ASHETON (1767-1815), born in Philadelphia and bred at Princeton, became a lawyer, and, elected to the House of Representatives, was a leader of the Federalists. From 1805 to 1813 he was a senator, and was one of the commissioners to negotiate the peace with Britain in 1814.—His son, of the same name (1799-1880), was an eminent barrister, and in the United States senate was a conspicuous democrat, and chairman of the judiciary commission.

Bayard, PIERRE DU TERRAIL, CHEVALIER DE, 'the knight without fear and without reproach,' was born in 1476, at the Chateau Bayard, near Grenoble. He was perhaps the only hero of the middle ages who deserved the unmingled praise and admiration bestowed upon him—simple, modest, a sterling friend and tender lover, pious, humane, and magnanimous. After acting as page to the Duke of Savoy, he entered the service of Charles VIII., whom he accompanied to Italy in 1495. He won his spurs at the battle of Fornovo, where he captured a standard from the enemy. Early in the reign of Louis XII., in a battle near Milan, Bayard followed the defeated and retreating forces with such impetuosity that he entered the city with them, and was made a prisoner, but the Duke Ludovico Sforza released him without ransom. At Barletta, in 1502, Bayard and ten other French knights fought a tournament with an equal number of Spaniards, in order to decide their respective claims to superiority; and although seven Frenchmen were overthrown in the first charge, the result, chiefly through Bayard's bravery, after a six hours' combat, was declared equal. Next we find him fighting bravely in Spain, and against the Genoese and Venetians. When Pope Julius II. declared war with France, Bayard hastened to support the Duke of Ferrara; but failed in his scheme for making the pope a prisoner. Subsequently, he won fresh laurels in Spain. In the war with Henry VIII. of England—who with the Emperor Maximilian had threatened Picardy, and besieged Therouenne, in 1513—when the French, on one occasion, were about to lay down their arms, Bayard made a sudden attack on an English officer, and, pointing his sword at his breast, said: 'Yield or die.' The Englishman gave his sword to Bayard, who in exchange gave his own, saying: 'I am Bayard, your prisoner; and you are mine.' The emperor and the king of England exchanged their prisoners without any demand of ransom for Bayard. In 1515, when Francis I. ascended the throne, Bayard was sent into Dauphiné to make a way for the army over the Alps and through Piedmont. In this expedition he made Prosper Colonna a prisoner. Next, at Marignano, he gained a victory for the king, who, in consequence, submitted to receive the honour of knighthood from Bayard. When Charles V. broke into Champagne, at the head of a large army, Bayard defended Mézières against all assaults, and on his entry into Paris he was hailed as the saviour of his country, was made knight of the order of St Michael, and appointed commander in his own name of 100 men-at-arms, an honour till then confined to princes of the blood-royal. He was mortally wounded by a shot from an arquebus, while defending the passage of the Sesia, April 30, 1524. He died with his face to the foe, reciting the

Miserere; and to Bourbon, who came up and expressed his pity—'My lord,' he said, 'I thank you, but pity is not for me, who die a true man, serving my king; pity is for you, who bear arms against your prince, your country, and your oath.' No highly was he esteemed for all noble qualities, that his death was lamented not only by the French king and nation, but also by his enemies. His body, taken by the enemy, was restored to France, and interred in the church of the Minorites' monastery, near Grenoble.

See the Lives of him by Hare (1911), Ville (1901), Terrebasse (1871), Poirer (1889), Champier (1525), and his secretary, Jacques Joffrey ('Le Loyal Serviteur,' 1527), of which there are translations by Sara Coleridge (1825), Kindersley (1848), and Larchey (1883).

Bayard, THOMAS FRANCIS (1828-98), born at Wilmington, Del., became a barrister, and, like his father and grandfather (see BAYARD, JAMES ASHETON) and other members of his family, sat in the United States senate. He was secretary of state under Cleveland, and in 1893-97 was ambassador to Britain.

Bayazid', or BAYEZEED, a town of Armenia, beautifully situated on one of the spurs of Ala Daghi, about 15 miles to the SW. of the foot of Mount Ararat. Prior to 1829 its population was upwards of 15,000, and it had a brisk trade; but afterwards the dread of Russian encroachments drove away most of its Armenian inhabitants, and it has now but 2000, mostly Kurds. At Bayazid the Russians defeated a Turkish army in 1854. In 1877 it was seized by the Russians, but was restored to Turkey by the Berlin Congress of 1878. It was again occupied by the Russians in November 1914.

Bayazid' I. See BAJAZET.

Baybay, a town on the west coast of the island of Leyte, in the Philippine Islands, at the mouth of the Pambanganan River, 45 miles SSW. of Tacloban; pop. 25,000.

Bayberry. See CANDLEBERRY.

Bay City, a city of Michigan, U.S., on the Saginaw River, which is here spanned by three bridges, 4 miles from Saginaw Bay, and 108 miles NNW. of Detroit. It is an important railway centre. A large trade in timber and salt is carried on, and there is some shipbuilding. Pop. 48,000. On the left bank of the river are the consolidated villages of Salzburg, Wenona, and Banks, known as West Bay City; and the village of Essex is at the north end of the city. These were consolidated with Bay City in 1891.

Bayer, JOHANN, a German constructor of charts of the stars, was born in 1572, at Rhain, in Bavaria, and died an advocate at Augsburg in 1625. His zeal for the Protestant Church was so conspicuous that he was commonly called *Os Protestantium* ('the Mouth of the Protestants'). His contributions to astronomy are contained in his *Uranometria* (1603), in which he gave 51 maps of the heavens, constructed from the observations of his predecessors, and followed by explanations in his *Explicatio* (1654).

Bayern. See BAVARIA.

Bayeux, an ancient city of Normandy, in the French department Calvados, on the Aure, 15 miles NW. of Caen. Many of the houses are built of wood, and the streets have a forlorn and decayed appearance. The Gothic cathedral—the oldest, it is said, in Normandy—was rebuilt after a fire by William the Conqueror in 1077; but the present edifice dates mainly from 1106 to the 13th century. The west front has two 12th-century steeples, and three sculptured porches. Porcelain and lace are manufactured. Pop. 8000. See R. S. Mylne, *Bayeux, its Cathedral and Churches* (1904).

Bayeux Tapestry, the name given to a panorama of sewed work, representing the invasion and conquest of England by William the Conqueror, preserved in the public library of Bayeux. This is not a Tapestry (q.v.) in the usual sense of the word, but closely resembles sampler work. It is sewed on a band of linen about 230 feet long by 20 inches wide, and is divided into 72 scenes, which are generally separated from each other by a tree or other object. Most of the scenes are described by Latin inscriptions sewed along the upper margin of the tapestry. The work contains figures of 623 persons, 762 horses, dogs, and other animals, 37 buildings, and 41 ships or boats. The figures are worked in worsteds of eight different colours, dark and light blue, red, yellow, dark and light green, black, and buff. The drawing is rude, but vigorous and spirited, and no attempt is made to show local colour; horses, dogs, &c. are blue, green, red, or yellow, as may have suited the convenience of the design. To distinguish objects at different distances from the spectator, different coloured worsteds are employed, with sometimes curious effect: thus, a blue horse may have its off legs red, or a yellow one green, and so on. The method of sewing has been to cover the object with threads laid side by side, and to cross-stitch it at intervals: the faces, hands, and, where bare, the legs are simply outlined in coloured worsted. The persons mentioned by name in the inscriptions are: King Edward the Confessor, Harold, Guy of Ponthieu, Duke William, Conan, Archbishop Stigand, Bishop Odo, Eustace of Boulogne, Robert of Mortain, Leofwine, Gyrth, Turolf, Wadard, Vital, and Ælfgyva.

This pictorial history—for so it may be called, and indeed, in several particulars, it is more minute than any written history we have—opens with Harold, prior to his departure for Normandy, taking leave of Edward the Confessor. Harold is next observed, accompanied by his attendants, riding to Bosham with his hawk and hounds; and he is afterwards seen, successively, embarking from the Sussex coast;

anchoring in France and being made prisoner by Guy, Earl of Ponthieu; redeemed by William, Duke of Normandy, and meeting with him at his court; assisting him against Conan, Earl of Bretagne; swearing on the sacred relics never to interfere with William's succession to the English throne, &c.; and finally re-embarking for England. The tapestry then represents Harold narrating the events of his journey to Edward the Confessor, whose death and funeral obsequies we next see. Harold then receives the crown from the English people, and ascends the throne; and next we have the news brought to William, who takes counsel with his half-brother, Odo, Bishop of Bayeux, as to the invasion of England. Then follow representations of the active war-preparations of the Normans; their embarkation; disembarkation; march to Hastings, and formation of a camp there; the battle, the death of Harold, and the flight of the English, with which the tapestry finishes.

As an example of the Latin inscriptions describing the pictures, we reproduce one of the longest of them in reduced fac-simile:

HIC WILLELM:DVX ALLOQVITVR:
SVIS:MILITIBVS:VT·PREPARAREN
SE:VIRILITER ET SAPIENTER:AD
PRELIVM:CONTRA:ANGLO RV M
EXERCITV:

It may be translated: 'Here Duke William exhorts his soldiers to prepare themselves manfully and discreetly for battle against the army of the English.' Our illustration gives the concluding portion of this scene, and represents the onslaught of the Norman knights on the English at the battle of Hastings.

Part of Bayeux Tapestry—Battle of Hastings.

Much laborious argument has been expended on the origin of the tapestry. Montfaucon and his 18th-century contemporaries assumed and argued (for the tradition is quite modern) that it must have been the work of William's queen, Matilda, and her women; others have assigned it to the Empress Matilda. A third party, with perhaps still stronger reasons, consider it to have been executed as a decoration for the cathedral of Bayeux,

under the orders of Odo, William's half-brother, who was, in 1048, appointed Bishop of Bayeux, a see which he held for fifty years. He took an active part in the invasion of England, appears as a prominent figure in the tapestry, and was rewarded by William with the earldom of Kent. He lavished much of his wealth on Bayeux, and rebuilt the cathedral in 1077. The fact that the tapestry exactly fitted round the nave of the

cathedral, and that, with the exception of a brief visit to Paris in 1803-4, for the inspection of Napoleon I., it has never been out of Bayeux, seems to give strong probability to the Bishop Odo theory.

Whoever may have been the author of it, there is no doubt that strong evidence exists in the tapestry itself of its having been designed at a date, if not exactly contemporary with the events depicted, at anyrate immediately afterwards.

The earliest existing mention of it is made in an inventory of the ornaments of the cathedral in 1476, where it seems to have been used at certain seasons to decorate the nave. There it remained unknown, except to the people of Bayeux, until 1724, when a drawing of a portion of it, which came into the possession of M. Lancelot, a member of the Académie des Inscriptions, finally led to its discovery a few years later. Although it has encountered many dangers from fire, revolution, invasion, and other causes, it has passed unscathed through them all; and it exists now as complete, and with its colours as fresh, as when executed.

It passed out of the keeping of the cathedral authorities towards the end of the 18th century, and was for many years in the hôtel de ville. Here it was barbarously used, being kept on a couple of rollers and exhibited to the curious by winding from the one to the other. A knowledge of its vast value, however, gradually dawned on its custodiers; and in 1842 it was deposited in an apartment built for the purpose, and placed under the care of the public librarian. This gentleman, M. Lambert, not only superintended the relining of the tapestry, but carefully and successfully restored certain portions which had suffered from age and the rollers. In 1871, during the Franco-Prussian war, the Prussians were so near the town that the tapestry was taken from the glass case in which it is displayed, and hidden till all danger was past.

The great importance of the tapestry as a contemporary record of the costumes and manners and customs of a period of such consequence in the history of England was at once recognised on its discovery, and at various times careful drawings have been made of the complete work, and about fifty works and treatises have been published concerning it. The best of these drawings was undoubtedly that made by Mr C. Stothard for the Society of Antiquaries of London. Commenced in 1816, it occupied two years' labour, and was published as vol. vi. of the *Vetusta Monumenta* by the Society in 1819. In 1872 the English Committee of Council on Education, having obtained the permission of the authorities at Bayeux, commissioned Mr Dossetter to prepare a full-sized photograph of the whole tapestry.

A reduction of this photograph was edited and described by M. F. R. Fowke, and published by the Arundel Society in 1875 (new ed. 1898). See the bibliography in Fowke; the article EMBROIDERY for the history of pictorial sewed work; Collingwood Bruce's *Bayeux Tapestry Elucidated* (1885); *Notice Historique et Descriptive sur la Tapisserie de la Reine Mathilde* (Bayeux, 1873); *La Tapisserie de Bayeux*, by Jules Compté (1878); a work published in London in 1907, and one by M. Deslandes of Bayeux in 1909; and *The Book of the Bayeux Tapestry*, by Hilaire Belloc (1914).

Bay Islands, a small group in the Bay of Honduras, 150 miles SE. of Balize. The cluster was proclaimed a British colony in 1852, but in 1859 they were ceded to the republic of Honduras. The chief of the six islands are Roatan (30 by 9 miles; 900 feet high), and Guanaja, whence in 1502 Columbus first sighted the mainland of America. Total pop. 3000.

Bayle, PIERRE, one of the most independent thinkers of the 17th century, was born in 1647 at Carlat, near Foix, in Languedoc. The son of a Calvinist pastor, he yet studied philosophy under the Jesuits at Toulouse. The arguments of his tutors, and still more his friendly intercourse and quiet disputation with a Catholic clergyman who lived in the neighbourhood, led him to doubt the orthodoxy of Protestantism, and shortly prevailed so far that he openly renounced his father's creed, and adopted Catholicism. But in seventeen months the conversation of his relatives brought him back to the Protestant profession. To escape ecclesiastical censure, he withdrew to Geneva, and thence to Coppet, on the Lake of Geneva, where he studied the philosophy of Descartes. After a few years he returned to France, and in 1675 was elected to fill the chair of Philosophy in the university of Sedan. In this office he remained until 1681, when the university was suppressed. His next appointment was that of professor of Philosophy at Rotterdam. The appearance of a comet in 1680 having given occasion to a widely spread alarm, Bayle in 1682 published his *Pensées Diverses sur la Comète*, a work full of learning, and treating, in discursive style, many topics of metaphysics, ethics, theology, history, and politics. This was followed by *Critique Générale de l'Histoire du Calvinisme de Maimbourg*. In 1684 he commenced a periodical, *Nouvelles de la République des Lettres*, one of the first successful attempts at a popular journal of literary criticism. The revocation of the Edict of Nantes led Bayle to write his *Commentaire Philosophique sur ces Paroles de l'Evangile: 'Contrains-les d'entrer'*, which professed itself to be a translation from the English, and contained a strong defence of the principle of toleration. In consequence of the accusations brought forward by the theologian Jurieu, who regarded Bayle as an agent of France, and the enemy of Protestantism, Bayle, though he skilfully defended himself, was in 1693 deprived of his license to teach. He now assiduously devoted his leisure to the *Dictionnaire Historique et Critique* (1st ed. 2 vols. Rotterdam, 1696; latest ed. 16 vols. Paris, 1820). This was the first work published under his own name. Again Jurieu came forward as Bayle's adversary, and induced the consistory of Rotterdam to censure the Dictionary, chiefly on account of the supposed irreligious tendency of the article on 'David,' and the commendation bestowed on the moral character of certain atheists. Bayle promised to expunge all the objectionable matter; but afterwards, when he found that the public entertained a different and more favourable opinion of the passages than the Rotterdam Consistory, he judged it best to allow them to remain as they were, or made only slight alterations. New opponents were called into the arena by his *Réponse aux Questions d'un Provincial*, and the continuation of his *Pensées sur la Comète*. Jacquelot and Leclerc now attacked his religious opinions, while others persecuted him as the enemy of Protestantism and of his adopted country, Holland. These literary and theological controversies had a bad effect on his failing health, and a disease, for which he refused to employ medical aid, proved fatal. He died December 23, 1706.

Accustomed to view every question scrupulously on all sides, Bayle was accused of doubting on religious matters generally; at least, it is not to be denied that his scepticism disbelieved the wisdom of the religious dogmatism that ruled both Catholics and Protestants in his day. His hostility to bigotry rather originated in his indifference to the doctrines about which theologians quarrelled, than in any clear conviction of the

iniquity of religious persecution. His scepticism was not based on a philosophical theory, but was rather that of an accomplished *littérateur*. With great eloquence and persistence he vindicated the doctrine that moral characteristics may flourish independently of particular religious opinions. His learning was perhaps more varied and curious than precise; his style is clear and natural, fluent but diffuse. Many articles in the Dictionary seem to have been chosen merely as vehicles to introduce numerous digressions in notes, not a few of which are prolix and uninteresting; but the greater number of the articles are characterised by good sense, logic, critical acumen, and learning. The work was proscribed both in France and Holland, was consequently very widely diffused in both countries, and exercised an immense influence over the literature and philosophy of the Continent. It was the dawn of the scepticism of the 18th century, and may be historically regarded as the protest of the enlightened human intellect against the irrational dogmatism of the churches.

His *Œuvres Diverses* were published in four volumes at the Hague (1725-31). See Life of Bayle, in French, by Desmaizeaux (Amsterdam, 1730), and in German by Feuerbach (1838); and the article by Bonet-Maury in the Hauck-Herzog *Realencyclopädie* (1896-1909).

Baylen. See BAILLEN.

Bayly, THOMAS HAYNES, an English songwriter and author, was born at Bath, October 13, 1797. After deserting successively both law and the church, Bayly, during a short sojourn amid the brilliant society of Dublin, first discovered his own powers as a ballad-writer and achieved his earliest successes. In 1824 he settled in London; and his *I'd be a Butterfly* was quickly followed by *The Soldier's Tear, We met 'twas in a Crowd, She wore a Wreath of Roses, Oh, no, we never mention her*, and many others, familiar wherever the English language is spoken. Bayly also wrote a novel, *The Aylmers*, several volumes of verse, some tales, and numerous dramatic pieces, the best of which was *Perfection*, a clever little comedy, produced by Madame Vestris, and once very popular. In his last years he suffered much from confirmed jaundice and dropsy, which brought about his death, April 22, 1839.

Bayne, PETER, born at Fodderty, Ross-shire, 19th October 1830, studied at Marischal College, Aberdeen, and became editor of newspapers successively in Glasgow, Edinburgh, and London. Author of *Christian Life at the Present Time*, *The Life of Hugh Miller* (1871), *Lessons from my Masters, Two Great Englishwomen*, and *a Life of Luther* (1887), he died 10th February 1896.

Baynes, THOMAS SPENCER, born at Wellington, Somerset, 24th March 1823, studied at Bristol College and Edinburgh University. At Edinburgh he became assistant to Sir William Hamilton, publishing a translation of the *Port Royal Logic* (1851), and an *Essay on the New Analytic of Logical Forms* (an exposition of Hamilton's *Quantification of the Predicate*). In 1857-64 he was assistant-editor of the *Daily News*, and in 1864 became professor of Logic, Rhetoric, and Metaphysics in the university of St Andrews. He had edited twenty-two volumes of the ninth edition of the *Encyclopædia Britannica* at his death, 30th May 1887. See his *Shakspeare Studies* (1894), with memoirs by Prof. Lewis Campbell, and Skelton's *Table-talk of Shirley* (1895).

Bay of Islands, an admirable harbour on the east coast of the northernmost portion of the North Island of New Zealand. It is about 11 miles across, and is so named from its numerous islands (nearly a hundred). Russell, the chief shipping

port in the north of New Zealand, is on its south side.

Bayonet, supposed to be named from Bayonne, of which Puysegur, its alleged inventor (*circa* 1650), was a native, is a dagger or small spear fixed at the end of a musket. According to some authorities, the bayonet is just the Malay Kris (q.v.), introduced by Dutch soldiers from the East Indies; anyhow, it is certain that bayonets were manufactured at Bayonne in 1663. These, called *bayonets-a-manche*, had handles which fitted into the muzzle of the guns; but the *bayonet-à douille*, or socket-bayonet, fitting round the barrel, so that the musket could be fired with the bayonet fixed, was invented by General Mackay in 1689, and introduced by Vauban into the French army in 1703. The bayonet with which the rank and file of the British infantry were armed up to the issue of the Lee-Metford magazine rifle (see RIFLES) was triangular in section, fitting round the rifle barrel by means of a socket, was 22 inches long, and weighed 15½ oz.

It was only adapted for thrusting. The latest pattern of it is seen in fig. 1, A. The sword-bayonet, which was a cut-and-thrust weapon of about the same weight and 24 inches long, sharpened on its front edge, had a handle by which it could be used as a separate weapon. It was fixed on the rifle as shown in fig. 1, B, and was carried by rifle regiments, gunners, engineers, all infantry sergeants, and seamen, being better adapted to the shorter rifle with which they were armed. As a result of the contract system in the manufacture of these weapons, various rumours got abroad of their quality, and according to *The Times* of 11th February 1886, 'one-third of the British army is armed with weapons which will fail our soldiers in the hour of need'; and this remark was to a great extent verified during the operations in the Sudan in that year, where many bayonets of both patterns were twisted and bent in charging—especially some naval sword-bayonets which had been made out of old cutlass-blades. To guard against a repetition of this, all the bayonets in use in the United Kingdom were re-tested early in 1887. The bayonet then issued to all branches of the service for the

Fig. 1.

Fig. 2.

long Lee-Metford rifle was a blade 12 inches long, double-edged, and with a point for thrusting. It was fastened to the *under* side of the rifle-barrel,

whereas the older bayonets were fastened to the right side. The army now has the short Lee-Enfield rifle, 3 feet 8 inches long, and the blade of the bayonet (fig. 2) is 1 foot 5 inches long, the whole in position being 5 feet 1½ inch long. The bayonet is single-edged, is on the under side of the rifle, and is no longer fixed to any part of the barrel, which is cased with hardwood right up to the muzzle. By this means there is less interference with the accuracy of the shooting when the bayonet is fixed.

The blades are forged from the finest steel, and after being hardened and tempered are severely tested. The testing-machine is a curved block, with a hole at one end, and covered with a wire guard for the protection of the workman. The point of the blade is placed in the hole, and the blade is bent to the curvature of the block, and must spring back perfectly straight. Very few fail to pass the test, those that fail mostly breaking short off. See FENCING.

Bayonne (Roman *Lapurdum*), a town of France, in the department of Basses-Pyrénées, situated at the confluence of the Adour and Nive, 4 miles from the Bay of Biscay. The two rivers divide the town into three parts—Great Bayonne, Little Bayonne, and St Esprit. Many of its streets are narrow and dark, but the town wears an air of wealth and comfort. Notwithstanding railway competition and a troublesome bar at the Adour mouth (which was 12 miles farther north till the 16th century), the port of Bayonne has a growing trade. The manners of the inhabitants as well as the architecture remind us of Spain, only 22 miles distant, but among the poorer natives the Basque type and the Basque tongue are predominant. The cathedral, begun in the 13th century, is admired for its three naves, its stately portal, and its elaborate roof. The Château Vieux (now military headquarters) dates from the 12th century. The Musée Bonnat contains works of art presented to his native city by Léon Bonnat, the painter. The citadel, on a height in St Esprit, was one of Vauban's masterpieces. Having opened its gates only during the armistice in 1814, it still bears its proud motto, '*Nunquam polita*.' Bayonne's manufactures include chocolate and leather; its hams are celebrated; in the district are blast-furnaces and chemical manure works; and it also exports pitwood, wool, salt, resin, and turpentine. An electric tramway runs to the Spanish border *via* Biarritz and St Jean de Luz. Bayonne belonged to the Duchy of Aquitaine, then to Gascony, and was in the hands of the English from 1152 to 1451. During the wars with Spain it was often besieged, but never taken. The 'Bayonne Decree' of Napoleon in 1808 against American shipping was an episode in the Continental System (q.v.). In 1814 it was besieged in vain by the British and Spanish allies, and in 1813-14 was the scene of a series of desperate bloody struggles. The Bayonet (q.v.) may take its name from Bayonne. Pop. 27,000.

Bayonne, a city of New Jersey, on the peninsula S. of Jersey City, between New York and Newark bays. It is one of the chief manufacturing cities of the state, with great docks, chemical-works, machine and boiler works, silk-factories, and the main plant of the Standard Oil Company (its refineries here being connected by pipe lines with New York, Philadelphia, Baltimore, and Pittsburg). Pop. (1890) 19,033; (1920) 76,754.

Bayreuth. See BAIREUTH.

Bay-window, or (corruptly) BOW-WINDOW, a window peculiar to late Gothic and Renaissance architecture, so called because it forms a *bay* or projecting space outwards from a room. The external walls of bay-windows are, for the most

part, either rectangular or polygonal, the semi-circular form, from which the term *bow* was probably derived, having been unknown prior to the introduction of the debased Gothic. Though

Bay-window; Cowdray House, Sussex (from Parker).

mentioned by Chaucer, bay-windows are not found in any of the styles before the Perpendicular, during the prevalence of which they were frequently introduced, particularly in halls. Bay-windows generally reach to the floor, and are frequently supplied with a seat, which is called the *bay-stall*. There are many very beautiful examples of bay-windows in the college-halls of Oxford and Cambridge. When used in upper stories, such windows are supported on corbels, or large projecting mouldings. See ORIEL.

Baza, an old town of Spain, 50 miles ENE. of Granada. It lies in a fertile plain, has remains of Moorish fortifications, a sulphur-spring, and 13,000 inhabitants engaged in the production of wine, fruit, and hemp. The *Bastia* of the Romans, and *Bastania* of the middle ages, Baza under the Moors was a flourishing town, with a population of 50,000.

Bazaar, or BAZAR (Pers. *bāzār*), an oriental market-place, either open or covered, where various articles, including slaves, are exposed for sale, and where eastern merchants meet for transaction of business, as on 'Change or at the Bourse in England and France. The bazaar in Ispahan is one of the finest; that in Tabriz perhaps the largest. The great bazaars of Constantinople and Cairo are better known to Europeans. Among western peoples, establishments for the sale of fancy goods are now often styled bazaars. The name is also commonly applied to a sale of miscellaneous articles, contributed gratuitously, for the purpose of raising money for a charitable or other special purpose.

Bazaine, FRANÇOIS ACHILLE, a marshal of France, born at Versailles, 13th February 1811. Entering the army in 1831, he served with distinction in Algeria, in Spain, in the Crimea, and in the Italian campaign of 1859. He took part in the French expedition to Mexico in 1862, and from 1863 till the end of the war held supreme command of the French forces. Already, in 1836 in Africa, he had gained the cross of the Legion of Honour; in 1856 he had been promoted to be Commander of the Legion; in 1863 he received the Grand Cross; and in 1869 he was made commander-in-chief of the Imperial Guard. At the outbreak of the great war with Germany, Bazaine was placed at the head of the 3d army corps near Metz. After the battles of Wörth and Forbach he took command of the main French armies, and on August 14, 1870, began a retreat from Metz. Defeated at

Mars-la-Tour and Gravelotte, he retired within the fortifications of Metz, which was immediately invested by Prince Frederick Charles. Attempts to escape failing, Bazaine capitulated October 27, when 3 marshals, over 6000 officers, and 170,000 men laid down their arms and became prisoners of war. In 1873 Bazaine was tried by a court-martial, and sentenced to degradation and death for having failed to do his duty. The sentence was commuted to twenty years' imprisonment. But in 1874 Bazaine contrived to escape from the fortress on the Île Ste Marguerite, near Cannes, where he was confined, and ultimately he made his way to Madrid. He published in 1883 a justification of himself in *Épisodes de la Guerre de 1870 et le Blocus de Metz*, which was immediately prohibited in France. He died 23d September 1888.

Bazán, EMILIA PARDO (Condesa de Pardo Bazán), Spanish novelist, was born at Coruña in 1851. She married in 1868, went to live in Madrid, and took part in politics. At first an Ultramontane, she came under Zola's influence. *Un Viaje de Novios* (1881), *La Tribuna* (1885), *Los Pazos de Ulloa* (1886), *La Madre Naturalista* (1887), *Insolación* (1889), and *Morriña* (1889) made and confirmed her reputation as leader of the Spanish naturalist school. Other novels and short tales followed, and she wrote also some literary studies and plays. Her style is vivid, and her descriptions of Galician life (as in *De mi Tierra*) have been much admired. She died in 1921.

Bazard, SAINT-AMAND, a French Socialist, was born at Paris in 1791. After the Restoration he helped to found the revolutionary society of the 'Anis de la Vérité,' and in 1820 an association of French Carbonari. He was the leading conspirator in the 'plot of Belfort.' In 1825 Bazard, impressed with the necessity of a total reconstruction of society, attached himself to the school of Saint-Simon, and became one of the editors of a Saint-Simonian journal termed *Le Producteur*. In 1828 he delivered at Paris a series of lectures, the substance of which was published in the *Exposition de la Doctrine de Saint-Simon* (2 vols. 1828-30), of which the first part was by Bazard, the second being chiefly the composition of Enfantin. He and Enfantin became the acknowledged leaders of the school. After the July revolution (1830) a larger scope was afforded to the Saint-Simonians. The masses were attracted by the doctrine that 'all social institutions ought to have for their end the moral, intellectual, and physical amelioration of the poor.' In a short time Bazard and his friends had 'created a new society, living in the midst of the old,' with peculiar laws, manners, and doctrines. But Bazard's connection with it was of short duration. He differed from Enfantin on the doctrine of the emancipation of women, and in 1831 seceded in disgust. His efforts to found a school of his own proved unsuccessful, and during a heated discussion with his former friend Enfantin he was struck with apoplexy, from the effects of which he never recovered. He died 29th July 1832.

Bazardjik, PAZARDJIK, or DOBRITCH, a town of Rumania, 26 miles N. of Varna, has an important fair in April. Population, 17,000. Founded 300 years ago, it was stormed by the Russians on 2d June 1774, and 3d June 1810. Bulgarian till 1913, it was ceded by the treaty of Bucharest.—**TATAR-BAZARDJIK**, or **TATAR-PAZARDJIK**, is a town of Bulgaria, on the Upper Maritza, 23 miles W. of Philippopolis by rail, with warm baths, and 20,000 inhabitants, having greatly increased since the Russo-Turkish war of 1877-78.

Bazeilles, a village in the French department of Ardennes, near the right bank of the Meuse,

4 miles SSE. of Sedan. A pretty, well-to-do place, it was bunt to the ground by the Bavarians on the day of the battle of Sedan (1st September 1870), in revenge either for its obstinate defence by the marines, or for the villagers having fired on the invaders, and maltreated some of their wounded. It was rebuilt, in great measure with English contributions, and now has some 2000 inhabitants.

Bazigars, a tribe of natives scattered over India, known also as Panchpiri, Kunjra, or Nats, most of whom lead a nomadic life. They do not intermix with the Hindus. It has been remarked that they have some features of resemblance to the Gipsies of Europe and Asia. They are of seven castes; the Bazigars proper are Mohammedans in religion and habit; the Panchpiri have no set system of religion, but with native flexibility adopt that of the village or place where they may be sojourning. The men collect medicinal herbs, exhibit wild beasts, or sell mats of their own manufacture, are adroit jugglers, and excel in feats of activity; some of the women sell tinkets, and excel in lascivious dances; others practise physic and cupping. They are short-lived, owing to their lives of systematic debauchery.

Bazin, RENÉ, born at Angers in 1853, studied law at Paris, but in 1888 made a name for himself by *Une Tache d'Encre*, followed by a long series of novels, works of travel, pictures of provincial life, social and literary studies, including *En Province*, *Les Oberlé*, *La Terre qui Meurt*, *Le Duc de Nemours*, *Stephanette*.

Bazoche, or BASOCHE, the guild of the clerks of the parliament of Paris, under a mock king, to whom Philip the Fair granted the privilege of performing religious plays in 1303. The officers of this harmless monarchy affected on all occasions the language of royalty. Its jurisdiction included the consideration and decision of all controversies that arose among the clerks, and it administered justice twice a week. At the carnival the members acted a species of satirical morality (see MYSTERIES), in which they made extensive use of the liberty granted to them, in ridiculing vices and the favourites of fortune. Of course, they could not fail to provoke enmity and occasion serious scandal, and in 1540 they were interdicted as incorrigible. They are interesting, however, as the forerunners of the comedy of Molière.

Bazzi, GIOVANNI ANTONIO. See SODOMA.

Bdellium, a gum-resin resembling Myrrh (q.v.) in appearance and qualities, but weaker, and at the same time more acrid. High medicinal virtues were ascribed to it by the ancients, but it is now little used internally, although occasionally employed as an ingredient of plasters. It is supposed to be the produce of Commiphora (or Balsamodendron) in India and in Senegal—trees or shrubs belonging to the natural order Burseraceæ, remarkable for the number of similar substances which it produces.—Egyptian bdellium, however, is obtained from the Dunn palm, *Hyphaene thebaica*. A similar substance is yielded also by *Ceratonia furcata*, of the natural order Compositæ; whilst the Sicilian bdellium, formerly used in medicine, is produced by *Davurcus gummifer*, a species of the same genus to which the carrot belongs.—The bdellium mentioned in Gen. ii. 12 and Num. xi. 7 may be this or a similar gum-resin; some have, with more probability, understood it to be a precious stone—a carbuncle, crystal, beryl, or pearl. See BALSAMODENDRON.

Beaches, RAISED. Geology teaches that the frame of the land is liable to risings and depressions, even in the present age. Several districts

in different parts of the world have been raised, in consequence of earthquakes, within the memory of the present generation; and there is evidence to show that the coast of Siberia east of the Lena, Spitsbergen, Nova Zembla, and the Scandinavian Peninsula (with the exception of Scania, in the extreme south) have been recently elevated. These facts prepare us to learn that around the British Islands, and in other parts of the earth, there are tracts of ground at various elevations above the present sea-level which have evidently been sea-beaches at a former time. The evidences consist of, first, the levelness of the ground in the general direction of the present shores over considerable spaces; second, the alternating beds of sand and gravel, such as we see composing the present beach; and, third, the presence of marine littoral shells. There are also what may be called terraces of erosion—indentations made in a rocky coast by the lip of the sea in ancient times—usually consisting of a flat platform presenting patches of gravel, and of a backing wall or sea-cliff, the latter sometimes penetrated with deep caves. In Scotland there are several well-marked raised beaches, at 100, 75-80, 45-50, 25-30 feet above the present sea-level. These beaches are best seen about the maritime regions of central Scotland. Most of the seaport towns are built upon the 25-30 feet beaches. Similar beaches are found in Ireland, and likewise in England, where, however, they do not occur at a greater elevation than 20 to 30 feet above the sea. Terraces of marine erosion (*Strandlinier*) occur in northern Norway at various levels, up to a height of 600 feet or thereabout. In the higher latitudes of the northern and southern hemispheres raised beaches are well developed, some reaching elevations of 2000 feet and more. See Dr Robert Chambers, *Ancient Sea Margins* (1848), and the standard works on geology.

Beachy Head, the loftiest headland on the south coast of England, projecting into the English Channel, $3\frac{1}{2}$ miles SSW. of Eastbourne, Sussex. It consists of perpendicular chalk-cliffs, 575 feet high, forming the east end of the South Downs. Several caverns have been cut out in the rock for shipwrecked seamen to take refuge in; but shipwrecks have been far fewer since 1831, when the Belle Tout Lighthouse was built $2\frac{1}{2}$ miles to the west. This lighthouse, 285 feet above the sea, is superseded by one at the foot of the cliff. The view from Beachy Head, in clear weather, extends to Hastings, the Isle of Wight, and France. The cliffs are the resort of myriads of sea-fowl. Off this point the French fleet, under Tourville, beat the combined English and Dutch fleets, under Torrington, 30th June 1690.

Beacon denotes any signal set upon a height, but especially the alarm-fires at one time used to spread the intelligence of foreign invasion or other great event. These fire-signals were in use in the earliest times, and notices of them are found in the literary remains of ancient Persia, Palestine, and Greece. They were made by kindling a pile of wood on the tops of lofty mountains, and keeping the flame bright by night, or having the fire so covered as to emit a dense smoke by day. There were various preconceived modes of exhibiting the light or smoke, so as to indicate the nature of the intelligence. Thus, an act of the parliament of Scotland in 1455 directs that one bale or fire shall be warning of the approach of the English in any manner; two bales blazing beside each other, that they are *coming indeed*; and four bales, that they are coming in great force. *Bale* is akin to the Sansk. *bhālas*, 'lustre,' Gr. *phalos*, 'bright;' *beacon* is a word of doubtful etymology, not found beyond the Teutonic languages.

An early instance of beacon-signals is found in the book of the prophet Jeremiah, in his call, in chap. vi. 1, to the people of Benjamin to kindle a fire-signal on one of their mountains: 'Set up a sign of fire in Beth-haccerem; for evil appeareth out of the north, and great destruction.' Another ancient instance of the use of a line of beacons occurs in the *Agamemnon* of Æschylus. The Greek commander is represented as communicating the intelligence of the fall of Troy to his queen, Clytemnestra, at Mycenæ, in the Peloponnesus. The line consists of eight mountains, and the news is supposed to be conveyed in one night from Troy.

In England the beacons were kept up by a rate levied on the counties, and had watches regularly stationed at them, and horsemen to spread the intelligence during the day, when the beacons could not be seen. They were carefully organised when the Spanish Armada was looked for. In 1856 an old beacon-work on Malvern Hill, which had done its part in former days in spreading the intelligence of the appearance of the Armada, of the Dutch fleet, and of the Young Chevalier, was lighted up in anticipation of the close of the Crimean war, and afforded an interesting amusement to scientific persons in estimating the distance at which the blaze could be seen from distant hills. Again, on the night of 21st June 1887, a multitude of jubilee beacons, throughout the length of the kingdom, received their signal from Malvern Hill, the time taken for its transmission thence to the Lake country being seven minutes.

Beacon, in maritime affairs, is an erection of stone, timber, iron, or concrete placed upon a rock or bank lying near the track of shipping, either on the open coast or in navigable rivers or estuaries, and is frequently equipped with a light or automatic acetylene signal. On the open coast, beacons are made of a sufficient size to give a chance of their being made out in the dark, and also of great strength to resist the shock of heavy breaking seas. When exposed to a very heavy sea, beacons are usually of stone or concrete and are built solid. Iron beacons are open pyramidal structures. One of the main columns of these large beacons (fig. 1) is provided with steps, so that any one cast upon the rock or reef may ascend to the cage on the top. This has often been the means of saving life. Fig. 2 represents the class of beacon sometimes used for rock foundations. It consists of strong cast-iron plates closely fitted and securely bolted together, the interior being filled with concrete, and is surmounted by an iron mast carrying a ball, triangle, diamond, or cone. Fig. 3 is a type used for sand-banks, and consists of a wrought-iron tube, 2 feet 7 inches in diameter, sunk into the sands, with a second length of tube added to carry the beacon above high-water level. The different types of beacons are almost innumerable, and are designed according to the situations for which they are intended.

Fig. 1.—Elevation of a Cast-iron Beacon; total height above high-water, 36 feet.

In 1881 a beacon automatically lighted by compressed oil-gas was erected on the Clyde, and many

Fig. 2.—Total height above high-water, 26 feet.

of this type have since been installed in many parts of the world. The stone or concrete base is surmounted by an iron tank containing a supply of gas compressed to about seven atmospheres, and above is placed the lantern with dioptric apparatus. The light may be fixed or flashing, and is turned up automatically at night. Sufficient gas to last three months is supplied through a strong canvas and india-rubber tube from tanks on the attending vessel.

In 1882 beacons were lighted automatically by volatile spirit on the Lundberg system, which burns day and night. The heat from the burner causes a fan with shades to revolve and produce occultations. The use of the volatile spirit was attended with danger, and the Benson-Lee lamp, which burned paraffin, was an improvement on the Lundberg system. A special burner was used, and the intensity of the flame was greater. Permanent wick lamps were introduced in 1891 in France, and Wigham lights have been adopted in many places. These beacons burn paraffin, and a fresh portion of wick is always being exposed to the flame. Their candle-power is small. Electricity has been successfully employed for beacon illumination, but is suitable only in special circumstances. Various automatic physical or chemical devices depending on the action of daylight have been tried for igniting and extinguishing lights, but have not proved of much practical importance.

Fig. 3.—Section of Wrought-iron Cylinder Beacon; height above high-water, 30 feet.

Many important beacons are now illuminated by acetylene, which has proved well suited for unattended lights. The acetylene is generated on the carbide to water system, which generates the gas as it is required and is very economical, or cylinders containing the acetylene dissolved in acetone are supplied regularly. Garroch Head, on the Clyde, is an acetylene unattended light in conjunction with a hyper-radiant apparatus. See also LIGHTHOUSE.

Beacon, a city of New York State, on the left bank of the Hudson, 58 miles N. of New York City, was incorporated in 1913 out of the villages of Fishkill Landing (or Fishkill-on-Hudson) and Matteawan. Fishkill Landing was in 1776-86 a great military depot. Pop. 10,000.

Beaconsfield, a little market-town of Buckinghamshire, 10 miles N. of Windsor, associated with the lives of Waller, Burke, and Lord Beaconsfield; pop. of urban district, 3600.

Beaconsfield, in the Cape Province, is a suburb of Kimberley.

Beaconsfield, BENJAMIN DISRAELI, EARL OF, statesman and novelist, was born 21st December 1804, in London; according to Mr Lucien Wolf, his father, Isaac D'Israeli (q.v.), was the son of a Benjamin who emigrated from Cento in Ferrara to London as a young man of eighteen in 1748, in connection with the Leghorn straw-bonnet trade, but became wealthy as a banker. The immigrant's father, Isaac Israeli in Ferrara, was the descendant of Levantine Jews: they do not seem ever to have lived in Venice. The future Earl, whose mother, Maria Basevi, was the descendant of a Jewish family which had been driven from Portugal by the Inquisition in 1730, was duly circumcised at the Spanish Synagogue in Bevis Marks, but in 1817, a boy of twelve, was baptised at St Andrew's, Holborn, with Sharon Turner for godfather. In 1821 he was articled to a solicitor; in 1824 entered Lincoln's Inn, and kept nine terms; for a time he tried stock-broking, and incurred a debt of £7000, which continued to harass him till his marriage. In 1826 he published the first part of *Vivian Grey*, not an over-bold forecast of his own achievements, so sparkling, arrogant, and egoistic, so full of piquant burlesque of the men and events of the day, that it straightway became the talk of the town, and gained him admission to the Blessington coterie. The second part, now little read, succeeded in 1827; the Gulliverian *Captain Popenilla* in 1828; and the high-flown *Young Duke* in 1831. In 1830-31 he took a twelvemonth's holiday in the Mediterranean, visiting Spain, Venice, Jerusalem (the homes of his ancestors), and describing his doings in the fourteen graphic *Home Letters* (1835), where we see him young, brilliant, foppish, affectedly affected, just as we know him in Maclise's portrait.

He returned to England to find the country in the throes of the Reform Bill; and in 1832 stood twice for Wycombe as an advanced Radical, backed by O'Connell and Joseph Hume. He failed both times, and failed again in 1835, when as a Tory he contested Taunton, quarrelling with O'Connell, and sending a challenge to O'Connell's son. Not until 1837, the first year of Victoria's reign, did he enter parliament, as member for Maidstone. Meanwhile he had published *Conrariis Fleming* (1832), a 'psychological romance,' a 'story of the development and formation of the poetic character'; *The Wondrous Tale of Alroy* (1833), a stilted romance of the 12th century; *The Revolutionary Epick* (1834), a blank-verse rigmorole, the idea of which was conceived on the plains of Troy, and which justified tyrannicide in a passage expunged from the 1864 edition; *Vindication of the English Constitution* (1835); *Henrietta Temple* (1836), a 'love-story,' a lawless one; and *Venetia* (1837), where Byron and Shelley figure thinly disguised. His maiden speech, on Irish election petitions, was clever enough, yet was greeted with shouts of laughter, till, losing patience, he cried, almost shouted: 'I have begun several things many times, and have often succeeded at last; ay, and though I sit down now, the time will come when you will hear me.' In less than nine years that time did come. A reckless free-lance at first, persistent in little save hatred of the Whigs, he had risen since 1842 to be head of the 'Young England' party, when suddenly, from the hour of his savage onslaught on Sir Robert Peel in the Corn-Law debate of 22d January 1846, he became the real leader of the Tory Protectionist squires, though their nominal chief for two years was Lord George Bentinck (q.v.). To this period belong *Coningsby* (1844), *Sybil* (1845), and *Tancred, or the New Crusade* (1847)—a trilogy intended to set forth the origin and condition of political parties, the consequent condition of the people, and the duties

of the church as a remedial agency. The 'Young England' creed in fact, *plus* the 'Asian mystery.' As Chancellor of the Exchequer and leader of the Lower House in the brief Derby administration of 1852, he coolly discarded Protection, and came off on the whole with flying colours; still, his budget was rejected, mainly through Mr Gladstone's attack on it; and Mr Gladstone succeeded him, in the Aberdeen coalition ministry. In 1858 he returned, with Lord Derby, to power, and next year introduced a petty measure of parliamentary reform—his 'fancy franchises' bill—whose rejection was followed by resignation. For seven long years the Liberals remained in office; and Disraeli, in opposition, displayed talents as a debater, and a spirit and persistency under defeat that won for him the admiration of his adversaries. With his return to the post of Chancellor of the Exchequer, in the third Derby administration (1866), came the strangest episode in all parliamentary history. He introduced and carried a Reform Bill (1867), far more democratic, more sweeping in its character, than one just rejected by the Conservatives and malcontent Liberals. True, a tentative measure was first put forward, every whit as unsatisfying as its predecessor. It would not do; none saw that sooner than Disraeli himself; so throwing overboard dissentient colleagues, among them Lord Cranborne (future Marquis of Salisbury), he produced a bill giving household suffrage in the boroughs, and widely extending the county franchise. It was 'a leap in the dark,' Lord Derby's own phrase; the leap at any rate was boldly taken. In February 1868 he succeeded Lord Derby as premier; but, in the face of a hostile majority, he resigned in the following December. On this occasion, Mrs Disraeli, in acknowledgment of her husband's services, was raised to the peerage as Viscountess Beaconsfield, an honour she survived only till 15th December 1872. The rich widow, fifty-six years old, of his first colleague, Mr Wyndham Lewis, she had married Disraeli in 1839. In 1870 appeared *Lothair*, a novel of which a reviewer in *Blackwood's* (Lord Salisbury, said rumour) observed that, 'on the whole, we had rather Mr Gladstone had written it.'

In 1874 Disraeli entered on his second premiership, the first two years of which were marked by the abolition of church patronage in Scotland, by an act to put down Ritualistic practices, and by one excellent measure, to protect British seamen against 'floating coffins,' which was forced on the government by Mr Plimsoll. But a spirited foreign policy was more to Disraeli's taste than humdrum domestic reforms. In 1875 he made Britain half-owner of the Suez Canal; and in 1876 he conferred on the Queen the new title of Empress of India, himself the same year being called to the Upper House as Earl of Beaconsfield. He had sat for Shrewsbury from 1841 to 1847, and thenceforward for Buckinghamshire. A free career was opened to his enterprise by the outbreak of insurrection in the Balkan Peninsula. Himself, he pooh-poohed the 'Bulgarian atrocities,' and was all for upholding Turkey as a bulwark against Russian aggression. When Constantinople seemed threatened, a British fleet was despatched to the Dardanelles, six millions were voted for military and naval purposes, and an Indian contingent was summoned to Malta. It was very magnificent; after all, though, it was not war, for the Berlin Congress (1878), which Lord Beaconsfield himself attended with Lord Salisbury, and which raised him to the zenith of his fame, gave back to Russia all she had lost by the Crimean war, and left Turkey the shadow of her former self. England's share was 'Peace with honour'—and with Cyprus, surrendered to us in an earlier secret engage-

ment. The Afghan and Zulu wars combined with commercial depression and with troubles in Ireland to sicken the country of an 'Imperial' policy; and the general election of 1880 returning a large Liberal majority, the government resigned before the meeting of parliament. The ex-premier employed his leisure in publishing *Endymion*, like so many of his novels the story of a fortunate politician. On 19th April 1881 he died at his London residence in Curzon Street; and the terms of his will precluding a public funeral in Westminster Abbey, he was buried at Hughenden, near Wycombe.

'It was one of the first principles of Mr Vivian Grey that everything was possible; none ever exemplified that principle better than Lord Beaconsfield. Member of an alien and persecuted race, a race without settled resting-place or civil rights, he rose to be champion of a proud landed aristocracy, the trusted friend of Britain's queen, an arbiter of Europe's destinies. We stand too near him now, rightly to determine his claim to greatness; but this one may safely say—for praise or blame, according to men's judgments—that, in almost everything he was the very opposite of his great adversary, Mr Gladstone. He was a master of epigram, a splendid debater, rather than an orator; he possessed that first-rate requisite of statescraft, lack of zeal; he was not one to be idolised or detested. Throughout he was faithful to his two leading beliefs—in the Jewish race, and in intellect (incarnate both in himself); throughout he was loyal, ay, as a Swiss guard, to his adopted country. It may be hard to decide whether he was a genuine Tory, whether he was not chiefly a hater of the Whigs. At least, he was a true leader, for he led the Tories always whither he would himself, and often whither themselves they would never have gone. In his famous Edinburgh phrase (1867), he 'educated' his party. The masses owe to him their first enfranchisement, and Britain by him was for a while rehabilitated as one of the Great Powers. His novels are as puzzling as himself. They are brilliantly clever, most witty and entertaining; but one vainly looks in them for humour, pathos, any of the deeper qualities. They will always, however, be read, for the key they furnish to their author's character, and for their caricatures of his contemporaries—of Brougham as 'Foaming Fudge' in *Vivian Grey*, and Canning as 'Charlatan Gas'; of Lord Lytton as the hero of *Coningsby*, Croker as 'Rigby,' Mr Gladstone as 'Oswald Millbank,' of Palmerston, in *Endymion*, as 'Lord Roehampton,' and so forth.

See GLADSTONE, YOUNG ENGLAND, HUGHENDEN, PRIMROSE LEAGUE, and works cited under those articles. See, too, *Lord Beaconsfield's Correspondence with his Sister, 1833-52* (1886); his *Selected Speeches*, edited by Kebbel (2 vols. 1882); an article on his novels, by Leslie Stephen, in the *Fortnightly* (1874); G. C. Thompson's *Public Opinion and Lord Beaconsfield* (1886); Sir W. Fraser's *Disraeli and his Day* (1891); and the Lives of him by John Mill (1863), O'Connor (hostile, 1879), Brandes (Danish, 1878; Eng. trans. by Mrs Sturge, 1880), Cuheval Clarygny (French, 1880), Ewald (1882), Hitchman (3d ed. 1885), Kebbel (1888), Froude (1890), Gorst (1900), and Meynell (1903); Bryce's *Studies in Contemporary Biography* (1903); and Mr Lucien Wolf's introduction, rich in new facts about the Israeli family and the Jewish houses with which they intermarried, prefixed to the Centenary Edition of the works (1905). Mr Sichel's *Study* (1904) also deserves mention; the biographies of Queen Victoria, Lord Granville, Mr Gladstone, and especially of Lord Cranbrook (1910) shed much light on Beaconsfield and the history of the Conservative party in his time; but the authoritative life is that by W. F. Monypenny, continued by G. E. Buckle (6 vols. 1910-20).

Beadle (O.E. *bydel*, modified by Fr. *bedel*), an inferior parish-officer chosen and appointed by

the vestry, was superseded under the parish council. The same name is applied to the messenger or crier of a court, to a university mace-bearer, and to a church-officer in Scotland.

Beads, a variety of personal ornament, made of glass, pottery, metal, bone, ivory, wood, jet, amber, coral, &c., and perforated so that they can be strung on threads and made into necklaces, bracelets, rosaries, &c., or worked on cloth as a kind of embroidery. Their use is of great antiquity, for they are found in the most ancient of the Egyptian tombs as decorations of the dead; and beads supposed to have been used in barter by the Phœnicians in trading with various nations in Africa are still found in considerable numbers, and are highly valued by the natives under the name of 'Aggry' beads. The origin of the name is unknown; but the coloured or variegated glass beads denoted by it are unquestionably of ancient manufacture; they are sometimes sold for more than their weight in gold. Ever since the 14th century, the manufacture of glass beads has been chiefly engrossed by the Venetians, and the glass manufacturers of Murano retain in large measure their ancient monopoly. Birmingham is the chief seat of the manufacture in England. The manufacture is curious: the melted glass, coloured or uncoloured, is taken from the pot by two workmen, who slightly expand the *gathering* of glass on the end of their blowing tubes. Each man then opens the hollow bulb of glass attached to his tube, and the two bulbs, while still soft and highly heated, are joined into one. This done, they walk rapidly away from each other in opposite directions, in a long shed like a small rope-walk, and draw the glass, which retains its tubular character given by the blowing, &c., into rods of great length, and often extremely small diameter. On cooling, which takes place very quickly, these long rods are broken up into short lengths of about a foot, and a small number of these shorter rods are placed on a sharp cutting edge, after being annealed, and are chopped into lengths. The roughly cut beads are next placed in an iron drum containing a mixture of plaster and charcoal dust. The drum is placed in or over a furnace, and a rotatory movement given to it. By this operation the short bits of tubes or perforated canes, which are softened by the heat, become rounded. The plaster and charcoal prevent the beads sticking together while soft. The beauty and infinite variety of Venetian glass beads are quite wonderful. They are sent to almost all parts of the world, but especially to African ports for the purposes of barter in the interior.

In Middle English *bede* signified 'a prayer,' and hence came to mean the small perforated balls of gold, silver, glass, ivory, or hard-wood used for keeping account of the number of prayers repeated. This curious transfer of the name from what is counted—the prayers—to that which is used to count them may be compared with that in Spanish, where *cuenta*, 'a bead,' is from *contar*, 'to count.' The old phrase 'to bid one's beads' means simply 'to say one's prayers;' and the modern phrase 'to tell one's beads,' literally 'to number one's prayers,' now means simply 'to say one's prayers.' A certain number of such beads strung on a thread makes a Rosary (q.v.). A *bedesman* or *bedeswoman* is one who prays for another. Persons of station and wealth in old times 'had regularly appointed bedesmen, who were paid to weary Heaven with their supplications.' Bedesmen frequently lived together in hospitals, and joined in prayers for their founders and benefactors, and hence *bedehouse* is synonymous with an almshouse. The King's Bedesmen in Scotland were licensed mendicants (see BLUE-GOWNS). A common form

of signature at one time was: 'Your bounden bedesman,' or 'Your humble bedeswoman,' instead of the modern 'Your obedient servant.'

Beagle (probably from Fr. *béguenole*, 'wide-throat'), the smallest variety of hound, formerly much used in England for hare-hunting. It has now been almost wholly superseded by the Harrier (q.v.), to which its name is sometimes given. The true beagle is smaller than the harrier, ranging from 10 to 15 inches in height at the shoulder (below which height it is difficult to obtain well-developed specimens), stout and compact in make, with long pendulous ears, smooth-haired, sometimes dark brown, with a streak or spot of white about the neck, but generally marked in the same way as foxhounds or harriers. The beagle is prized for its keen scent and perseverance; and although much distanced by the hare at first, it is almost sure to kill it. It was customary in England, in former times, when beagles were used, to follow the chase on foot, a hunting-pole being employed to assist in leaping. The smaller breeds, though extremely delicate animals to rear, were preferred (see DOG).

Beak. See BILL.

Beale, DOROTHEA (1831-1906), principal of the Cheltenham Ladies' College for nearly half a century, wielded far-reaching influence on women's education. See Life by Miss Raikes (1908).

Beale, LIONEL SMITH (1828-1906), physician and physiologist, born in London, studied medicine at King's College, where he afterwards became professor (till his retirement in 1893). Besides the usual professional distinctions, he was F.R.S., and a member of scientific societies in Sweden, New York, Italy, and Belgium. He made numberless contributions to the *Lancet* and other special journals, and published books of great value on microscopy, kidney diseases, urinary deposits, the distribution of nerves to voluntary muscle, the structure and growth of the tissues. More important still are his *Protoplasm, or Life, Force, and Matter* (1870); *Life Theories, their Influence upon Religious Thought* (1871); *Life and Vital Action in Health and Disease* (1875); *Principles and Practice of Medicine in Slight Ailments* (1880).

Beam (O.E. *bēam*, 'a tree'), any piece of wood, long like a tree. In the arts, the word has many special technical applications. It is the name, for instance, for part of a weaving-loom, of a balance, and of a stationary steam-engine. Beam in engineering is a strong stay of wood or of iron, for supporting lateral pressure. In ship-building it is applied to any of the transverse pieces of framing extending across the hull. In ship measurement it means breadth at the wales (see TONNAGE). The position of the beams, stretching across a ship at right angles to the keel, has given origin to many technical phrases used on shipboard. 'On the starboard beam' is applied to any distant point out at sea, at right angles to the keel, and on the starboard or right hand—as viewed from the stern—side of the ship. 'On the port beam' similarly applies to the left hand. 'On the weather beam' is that side of the ship which receives or is towards the wind. 'Before the beam' is the bearing of any object when seen more in advance than *on* the beam. 'Aft the beam' is the reverse of the expression just noted. 'On her beam-ends' is applied to the position of a ship when so much inclined to one side that the beams become nearly vertical.

Beaming is the art of winding the web on the weaver's beam in a manner suitable for weaving with regard to firmness and evenness. It is to some extent a special employment, followed by workmen trained as beamers. See WEAVING.

Beam-tree, WHITE (*Pyrus aria*, see PYRUS), a tree of 20–40 feet in height, a native of almost all parts of Europe and of corresponding climates in Asia, not uncommon in the mountainous districts of Britain, and frequently planted. It belongs to the Pomaceæ tribe of the natural order Rosaceæ, and used to be called Sorbus. It has a straight erect trunk, and a round or oval head; the leaves are ovate, cut and serrated (in some varieties deeply lobed), white and downy beneath; the flowers in large terminal corymbs; the fruit scarlet, of the size of small peas. The fruit is acid and astringent, but becomes agreeable when in a state of incipient decay; it is sometimes called Sorb or Service-berry, and resembles the true Service (q.v.) in quality, although much smaller. Beer is made of it by fermentation, and by distillation it yields a powerful spirit. The wood is very hard, and of a fine close grain, yellowish white, but easily stained, and capable of taking a high polish. It is much used in turnery in making handles to knives and forks, wooden spoons, parts of various musical instruments, surveyors' scales, and as a substitute for pear-tree and boxwood.

Bean is a term used to designate the seeds of various plants, but in England is generally applied to those of different species belonging to the natural order Leguminosæ, as, for instance, the Common Bean (*Faba vulgaris*), the French, Kidney, or Haricot Bean (*Phaseolus vulgaris*), the Mollucca Bean (*Guilandina bonducella*), the Locust Bean (*Ceratonia siliqua*), the Tonka Bean (*Dipterix odorata*), and others. The term is also applied to the seeds of other plants widely different from each other and from the Leguminosæ. Of these the Pitchurim Bean, the seed lobes of *Nectandra puchury*, a relative of the Cinnamon and a native of tropical South America; St Ignatius' Bean, the seed of *Ignatia amara*, closely allied to *Strychnos* (q.v.), the source of strychnia, and itself strongly impregnated with the deadly qualities of that drug; the Egyptian or Sacred Bean, the seed of *Nelumbium speciosum*, an aquatic plant held in veneration by eastern peoples; and the remarkable Calabar Bean (q.v.), *Physostigma venenosum*, are a few of the many instances of plants whose seeds are popularly designated beans.

The common bean is a valuable source of food to man and animals in most of the temperate climates of the globe. It is of eastern origin, and was cultivated by the Egyptians, the Greeks, and the Romans, who introduced it into Britain. The varieties are numerous, several of them being adapted to field cultivation. It is only used as human food in this country in the green or unripe state, but the ripe beans are valuable as food for pigs, horses, and cattle. The Greeks and Romans looked upon it as in some respects a sacred plant; in the Roman festival of Lemuralia (see LEMURES) the father of the family threw black beans over his head, repeating certain traditional words. Pythagoras forbade his disciples to eat beans. Beans were used by the ancient Greeks and others in voting by ballot, and a survival of this custom has lingered in the election of kings and queens at Twelfth Night and other feasts.

Beans of the ordinary kind belong to one species, *Faba vulgaris*, natural order Leguminosæ. The common field varieties are the Tick Bean, the Scotch Horse Bean, the White Cluster, the Chatteris, and the Winter Bean. The garden sorts (other than French beans) are larger, such as Longpods and Windsors, and are generally known as 'broad beans'—the proverbial 'beans and bacon,' used as food, especially by the poorer classes in England. Beans grow best on the heavier classes of soils, and are usually planted after wheat or some other grain crop. The most com-

mon method of preparing the land is to plough in farm-yard manure early in autumn. The common concentrated manures, other than potash, give as a rule poor results. The seed, 2 bushels to 2½ bushels per acre, may then be drilled, or sowing may be delayed till February, when the land is found to be mellowed by the winter frosts; 3 bushels to 4 bushels of seed is then required of some spring-sown variety; 3 inches is a good depth for winter planting, and 2 inches in spring; 18 inches is a convenient distance between the rows, allowing space for thorough horse-hoeing and hand-hoeing, which is necessary, as the bean is a dirty crop. Beans may be broadcast and covered easily by harrowing, but the system, although simple, is objectionable, because the land cannot be properly cleaned when the crop is growing, and rather more seed is necessary. Sowing may be done every second furrow while the land is being ploughed, by means of Reeve's patent sower attached to the plough. This system is well suited to planting beans in autumn on land being broken up from grass. Autumn-sown beans grow the heaviest crop, if they escape severe winter frosts or frequent sudden change of temperature, which is apt to kill them; they are also ready to harvest in England with the wheat-crop, and can be cut without injury in bad weather during harvest, which is a great convenience, as well as a saving of expense. Spring-sown beans are rather later in coming to maturity, which means in England dead-ripe. In Scotland, beans are cut at an earlier stage, as the straw is at times used for horse fodder, being usually chopped and mixed with hay or oat straw. Ripened beans are ground into bean-meal, used as food for horses and cattle, and sometimes made into coarse bread. Beans take longer to dry after being put into sheaf than cereal crops, but are not so easily injured by bad weather; they are stacked in the same way as wheat, openings being left through the stacks for ventilation, to prevent moulding and injury to the seed. Beans are liable to be attacked by parasites, as Rust (*Uromyces Fabæ*), Powdery Mildew (*Erysiphe*), Downy Mildew (*Peronospora viciae*), and Pod-blotch (*Ascochyta pisi*). If these diseases are largely developed, the crop is best ploughed down as a green-manure after being laid by rolling. The most serious insect enemy is the *Bean aphid* or Black Dolphin, which begins at the top of the plant, and multiplying into myriads, covers and destroys it. If taken in time, the crop may be saved by cutting off the tops; if not, it has to be eaten off green by sheep, or if not required for food, it may be ploughed in. The humble-bee pierces through at the base of the flower to reach the honey, but this is not now thought to be injurious.

The French Bean (*Phaseolus vulgaris*) and the Scarlet Runner (*Phaseolus multiflorus*) are grown in most English gardens, and the pods eaten as vegetables. They should be grown on rich land in a fine tilthy state; fresh manure is injurious to them. Scarlet runners are sown towards the end of May or early in June, in rows 2½ to 3 feet apart; French beans are sown in May, and up till the end of July. The runners continue to yield until autumn frosts set in, and French beans also, if sown late.

The beans grown in the United States are for the most part either haricots or closely allied kinds.

Bean-caper, a name applied to *Zygophyllum fabago*, whose flower-buds are used in the East as a substitute for capers.

Bean Feast is a name for an annual dinner given by employers to their workpeople—possibly so called because *beans* or a *bean-goose* figured prominently in the repast.

Bean Goose. See GOOSE.

Bean King's Festival. See TWELFTH DAY.

Bear (*Ursus*), a genus of large mammals in the order Carnivora. They differ from the related cat and dog types in being much less markedly carnivorous in habit and structure.

General Characters.—The stout body with thick legs and very short tail is covered with long shaggy fur; the entire under surfaces of the naked palms and soles rest on the ground in what is termed plantigrade fashion; the long claws are comparatively blunt, and are not retractile; the more or less elongated head, with short rounded hairy ears, runs out into a blunt somewhat hog-like snout; the bony external ear-bulb (tympanic bulla), so conspicuous on the skulls of most carnivores, is here rudimentary; the teeth have the same number and arrangement as those of the dog, but in association with the omnivorous and largely vegetarian diet the canines remain less developed, the special cutting teeth (sectorials) less sharp, and the molars have flattened and tuberculated grinding surfaces. Compared with the higher carnivores, bears are slow and less aggressive, relying more upon strength than cunning, and more or less contented with vegetable food. Though clumsy and heavy animals, they are thoroughly active, and some of them swim and climb with much agility. Most of them sleep through the winter, when their food is usually scarce, and it is at this season that the young cubs are born.

History.—In the earlier ages of civilisation bears bulked much more largely both in the imaginative and the practical life of men. In Greece the bear was king of the woods and sacred to Diana, though none the less a favourite object of the chase. He is a prominent figure in the mythologies and herotales of Northern Europe; and the same mixed reverence for a formidable antagonist is exhibited still by the North American Indians, who excuse themselves for eating it by an elaborate preface of compliment and respect. Bears used to be common beasts of chase in Europe, as many personal and local names abundantly testify. Large numbers were imported to Rome from various quarters, especially towards the decline of the empire, and supplied abundant material for the cruel conflicts of the amphitheatres. It is indeed on record that as many as a thousand bears were on one occasion exhibited. Bear-baiting prevailed to a much later date, and even in the time of Queen Elizabeth and her successor it was a recognised fashionable amusement to go to the bear-gardens, and see the victims worried to death by dogs. The name *Brunn* playfully given to bears is derived from the old poem *Reynard the Fox* (q.v.), where the bear has the name of 'Brown'; 'bruin' being the Dutch spelling of 'brown.'

Distribution.—The genus, though not a large one, is widely distributed in cold and temperate regions, and in the secluded uplands of some warmer countries. About ten species frequent various parts of Europe, Asia, and North America, while the African Bear (*Ursus crathrus*) of the Atlas Mountains, and the South American Spectacled Bear (*U. ornatus*) of the Andes, are the only two representatives known to occur on these two continents. Their geographical range has been gradually becoming more and more restricted.

From the Pliocene strata of Europe and the deposits of the Siwalik Hills, two extinct species of bear have been dug up (*U. arvernensis* and *U. etruscus*). The Post-pliocene European caves are rich in remains of the Great Cave-bear (*U. spelæus*), along with those of the still abundant Grizzly. None of the above extinct forms differ markedly from existing species, but related genera

like *Arctotherium* and *Hyænarctos* lead back to such a primitive form as *Amphicyon*, which is supposed to be at 'the converging point of the dog and bear family lines.'

Different Forms.—The common Brown Bear (*Ursus arctos*), a variable species, inhabiting Europe and Asia, and regarded by some as identical with the black bear of North America. It used to be

Common Brown Bear (*Ursus arctos*).

found in Britain, but seems to have been exterminated in Scotland about the end of the 11th century. It measures about 6 feet in length, and stands 3 feet or so high at the shoulders. The long fur is predominantly dark brown, but very variable in colour. They eat all sorts of things—roots, berries, vegetables, ants, honey, fish, &c., and when these fail, other quadrupeds both small and large. The males and females only meet at pairing time, and the males are said to be more inclined to eat the cubs than in any way to care for them. The mother bear, on the other hand, is devotedly fond of her offspring, is ready to defend them at all costs, and when in their company is a most dangerous animal. In spite of the shuffling awkward gait, the brown bears are agile animals, climbing and swimming with ease, and able to attain a considerable speed in running. Their senses of smell and hearing are very acute. When hunger prompts them to attack large quadrupeds, their usual method is to hug their prey to death within their powerful arms. At the beginning of winter, when food is becoming scarce, but before the bear has had time to get out of condition, it seeks some sheltered nook in a cave or hollow tree, and after making itself snug and comfortable, falls into a winter sleep. During winter the female gives birth to from one to three cubs, which are cheished in the lair until spring. They remain blind for about a month, and are suckled for other two. When the bears reappear after their long rest they are thin and weak, and not unnaturally voracious. They attain a considerable longevity of 40 to 50 years. When kept in captivity they seem apt to sink into a phlegmatic mood, to which they appear to have a natural predisposition; they may, however, be taught to dance clumsily on their broad soles, and are said to have a good ear for music. Numerous stories are told, moreover, of their affectionate disposition when properly treated, though they are generally soured and crossed by confinement. The skins are greatly valued, the flesh of the cubs is very palatable, bears' paws form a

special delicacy, and the fat or bear's grease is a well-known unguent. In Kamchatka, different parts of the bear, which is very common, are used in a great variety of ways—e.g. the intestines for window-panes.

The American Black Bear (*Ursus americanus*) is regarded by some as merely a variety of the former, from which it differs only in a few trivial characters, such as blacker fur, more slender snout, more convex forehead, and the like. It inhabits North America, is even more thoroughly vegetarian than the Eurasian form, and much less dangerous than the Grizzly. If food be abundant in the late autumn, and the bears in consequence in good condition, they fall into a winter sleep in an often snow-covered hiding-place. They are revered or almost worshipped, but at the same time hunted and eaten by the Indians. The skins are largely utilised for caps, rugs, &c., and value from £1 to £3. Closely related to the above forms are the Syrian Bear of Lebanon and the Palestine mountains, and the Indian White Bear of the Himalayas. The former species (*U. syriacus*) is repeatedly mentioned in the Bible, and was much used in the Roman exhibitions. The Himalayan Bear (*U. ussibellinus*) is probably only a variety.

Quite distinct from the above is the Grizzly Bear (*U. horribilis*, *cineurus*, or *ferox*) of North America (from Mexico to 61° N.), a very large, strong, and fierce animal, chiefly at home on the Rocky Mountains. Though the characteristics of this powerful species are well marked, it was not till the explorations of Lewis and Clarke in 1802-6 that it was known to be a distinct type. The dark brown fur has a good deal of gray about the head, the ears are short and conical, the forehead broad and flat, the tail extremely short, the claws long, curved, and whitish. The adult Grizzly cannot climb trees. It is larger and stouter than the brown bear, more markedly carnivorous, and a very much more formidable beast of chase. It is said to be able to drag a buffalo carcass along, and is by far the most ferocious of bears. Attacked by man, it will pursue the assailant till the last. It is extraordinarily tenacious of life. A case is authenticated of a Grizzly receiving ten balls in its body, four of which passed through its lungs and two through its heart; it nevertheless swam half a mile, and did not succumb for twenty minutes. The skin is less valuable than that of the brown and black bears. The Indian or Tibetan Black Bear (*U. tibetanus*) and the Japanese species (*U. japonicus*) do not differ markedly from any of the preceding.

Somewhat different from the bears above described are a few forms for which separate genera are often erected. The Malayan Sun Bear (*Helarctos* or *Ursus malayanus*), inhabiting the Malay Archipelago, has a short, broad head, long extensible tongue, short, smooth, black fur, and remarkably long claws. Its maximum length is about 4½ feet. It does great damage to the coconut plantations. The Sloth Bear (*Melursus* or *Ursus labiatus*), which is still more divergent, inhabits the mountainous regions of Southern Asia and Ceylon. The first upper front tooth is absent or shed very early, and the other teeth are very small. Sloth bears are clumsy, uncouth animals, 5 to 6 feet long, with shaggy black fur, and with prolonged snout and lips which are utilised in sucking white ants out of their nests. They are for the most part contented with insects, honey, and vegetables, but often do considerable damage to the plantations. They admit of being readily tamed, and are often led about by Indian jugglers. The Spectacled Bear of the Peruvian and Chilean Andes (*Tremarctos* or *Ursus ornatus*) is a small form about 3½ feet long, with black fur, and

curious light-coloured rings round the eyes. A closely related species inhabits the island of Formosa.

The Polar or White Bear of the Arctic regions (over the whole Polar zone) (*Thalassarctos* or *Ursus maritimus*) has a comparatively narrow head, a pointed snout, small rounded ears, and a long neck.

Polar Bear (*Ursus maritimus*)

The grinding teeth are smaller and narrower than usual, and the soles of the feet more hairy. They feed principally on fish and seals, rarely attacking terrestrial quadrupeds, and not despising vegetable food in summer. They are the largest bears, often measuring 9 feet in length, and are proportionately strong. They move heavily, but not slowly over the ice, and are able to swim with much swiftness and endurance. They are more aquatic than any of the other species. Tales of polar explorations seem to show that the white bear is more aggressive towards man than any of the other species, and it is certainly the most carnivorous type. As food is abundant in winter, the males at least do not seem to hibernate. The she-bears, however, find sheltered nooks in the autumn, and bear one to three cubs in midwinter. The dwellers in the far north are fond of hunting the polar bear, and use the flesh for food, the fat for burning and curative purposes, the sinews as twine, and the skin for clothing. The genus *Ailuropus* is of some importance as a connecting link between the bears proper and other carnivores like the Panda (q.v.). See CARNIVORA.

Bear, BERE, or BEER. See BARLEY.

Bear, GREAT and LITTLE. See URSA MAJOR and MINOR.

Bear-baiting. In different countries, bears were formerly made objects of cruel sport, by being baited with dogs. In England it was a favourite amusement as early as the reign of Henry II., whilst at a later period a 'royal bear-ward' was an officer regularly attached to the royal household. The sport is frequently alluded to by Shakespeare and Ben Jonson, and it was not only encouraged by Queen Elizabeth, but it was placed under the particular patronage of her majesty. An order of the Privy-council, in July 1591, prohibited the performance of plays on Thursdays, because on Thursdays bear-baiting and the like pastimes had been usually practised; and an injunction to the same effect was sent to the Lord Mayor, wherein it is stated 'that in divers places the players do use to recite their plays to the great hurt and destruction of bear-baiting, and the like pastimes, which are maintained for her majesty's pleasure.' The queen's bears were kept at the Paris Gardens,

Bankside, Southwark, close to the river, named after Robert de Paris, a nobleman of the time of Richard II. Every town of importance at that time kept its bear, bear-ward, and pack of dogs. It is hardly necessary to add that bear-baiting, like bull and badger baiting, has long been unknown in England, having been prohibited by parliament in 1835.

Bearberry. The RED BEARBERRY (*Arctostaphylos uva ursi*) is a small trailing evergreen shrub, common in the Highlands of Scotland and in the Hebrides, and ranging over northern and alpine Europe, Siberia, and North America. It grows in dry, heathy, and rocky places. The flowers are in small crowded terminal racemes, of a beautiful rose colour. The berries are austere and mealy; they are said to be largely eaten by bears in northern regions. Grouse also feed on them. The dried leaves are used as an astringent and tonic medicine, especially in chronic affections of the bladder; but those of the Cowberry (*Vaccinium vitis idæa*) are substituted for them.—The BLACK BEARBERRY (*A. alpina*), of similar distribution, is a small trailing shrub, with black berries about the size of a sloe, which are relished by some.

Beard. The hair of the beard, moustache, and whiskers, is usually, though not always, of the same colour as the hair of the head, but somewhat shorter, stronger, and more wiry; it is invariably the colour of the hair on the eyebrows. The beard is the distinctive sign of manhood. In women, an incipient beard sometimes appears in the later years of life. Instances also occur of women with a beard almost equal to that of the male sex, the most celebrated 'bearded lady' being Margaret of Parma, regent of the Netherlands (1559). The beard is generally luxuriant in persons of the Slavonic and Celtic races. The aborigines of America, who are naturally almost beardless, make themselves entirely so by plucking out the hairs of the beard. In early times the beard was considered by almost all nations a sign of strength and an ornament of manhood, was carefully cherished, and even regarded as sacred. Among the Turks, Arabs, Persians, and many other nations, the removal of the beard was, and is yet to a very great extent, regarded as a severe punishment, and an extreme degradation. The Moslems, who are accustomed to swear by the beard of the prophet and by their own, carry combs constantly about with them for the purpose of dressing the beard. It is common to do so immediately after prayers, the devotee remaining on his knees during the operation. The hairs that fall out are then carefully picked up and preserved for entombment with their owner when he dies; frequently he himself deposits them beforehand in his destined tomb. The ancient Jews did not dye their beards, but the practice was common among the Arabs and Persians. The Arabs dyed the beard red, not only because dye of that colour (being merely a paste of *henna* leaves) was easily obtainable, but because it was an approximation to golden yellow, the colour recommended by their prophet Mohammed, who hated black, the colour the Persians preferred. The red beards of some of the suite of the sultan of Zanzibar caused no little surprise on the occasion of his visit to England in 1875. The Persian kings are said to have interwoven their beards with gold thread. It is customary among the Turks to anoint the beard with perfume, and to smoke it with incense. The Jews also anointed their beards. The Moslems commonly clipped their whiskers, the Jews did not. The Egyptians shaved their beards except in time of mourning, when they let them grow. They sometimes, however, wore false beards of plaited hair, varying in form and length with the rank of

the wearer. In Greece the beard was universally worn till the time of Alexander the Great, who ordered shaving, that the beards of his soldiers might not be laid hold of by their enemies in battle. Shaving was introduced among the Romans about 300 B.C. Pliny says Scipio Africanus was the first Roman who shaved every day. Subsequently, the first day of shaving was regarded by the Romans as the entrance upon manhood, and celebrated with great festivities. Under Hadrian, the beard was again allowed to grow, and this fashion prevailed till the time of Constantine the Great, when it was discontinued. Amongst the ancient West Goths and Burgundians, the removal of the beard was a sign of servitude, or loss of honour; nobles wore long beards. In the time of Charlemagne, the upper classes wore at most a moustache, while the common people cherished a full beard. The wearing of the beard, shorter or longer, was usual amongst the gentry from the 10th till the 12th century; subsequently throughout the middle ages the higher ranks shaved closely. Peter the Great compelled shaving in Russia by imposing a heavy tax upon the beard, and further, by having the beards of all whom he found wearing them plucked out by the roots, or shaved with a blunt razor. The beard was commonly worn in France till the time of Louis XIII., when, because the monarch was young and beardless, the fashion changed at the court and throughout the kingdom. A similar change took place in Spain on the accession of Philip V. The English wore beards for a considerable time after their invasion of Britain; and the beard appears to have been general among the people at the time of the Norman Conquest. But the Normans not only shaved themselves, but compelled the conquered to do so likewise; and many of the English chose rather to leave the country. It would appear, however, from sculptures on the tombs of kings and nobles, that not very long after the Conquest some of the Normans adopted the custom they had prohibited among the vanquished. Edward III. is represented on his tomb in Westminster Abbey with a very long beard. In the time of Elizabeth, beards were of the most varied and fantastic cut; and Taylor the 'Water-poet' satirises the extravagance of beards prevailing in that and the succeeding reign.

Under Charles I. were worn the moustache and peaked beard, familiar through Vandyke's portraits; in Charles II.'s reign moustaches only were worn; and the practice of shaving the whole face soon became general all over Europe. Among the clergy, too, there has been great diversity in the matter of beard-wearing at different times and in different countries. One is apt to associate the beards of the reformers with their Protestant tenets; but, as a matter of fact, all the popes were bearded from 1523 to 1691. Nowadays the clergy of the Eastern Church go bearded; of the Western, closely shaven. In the Anglican Church many of the inferior clergy have long worn beards; but Bishop Ryle of Liverpool (1880) was the first bearded prelate for many a day. The Worcestershire militia claims to have been the first English regiment to adopt the moustache, in 1798, and to have borrowed the idea from the Austrian service. The growth of the full beard dates in France from the capture of Algiers (1830), in England from the Crimean war (1855). In France during the second empire, moustache and 'imperial' after the manner of Napoleon III. were usual. For a good while a beard was regarded by some of the continental governments as a badge significant of democratic sentiments, and as such was interfered with by police regulations. Certain nations, such as Poles and Hungarians, usually grow only moustaches. Side-whiskers were long an especially English

characteristic. Of late the tendency is to leave the individual to choose what particular portion of his face he will shave or leave unshaven. Physicians recommend that the beard should be allowed to grow on the chin and throat in cases of liability to inflammation of the larynx or of the bronchiæ; and moustaches and whiskers are reckoned useful for prevention of toothaches and nervous diseases of the face. The beard is itself liable to the same diseases as the hair of the head, and to a peculiar disease (*mentagra*) occasioned or kept up by shaving, and consisting in a bark-like exudation from the inflamed sebaceous glands of the hair. See BARBER, HAIR.

Beard, GEORGE MILLER, an American physician, born May 8, 1839, in Connecticut, studied at Andover and Yale, and served during the war as an assistant-surgeon in the navy. In 1866 he settled in New York as a specialist in nervous diseases, on which he lectured for some years at the university. Besides suggestive books on eating and drinking, stimulants and narcotics, hay fever, sea-sickness, and sexual neurasthenia, Beard produced a valuable work on *American Nervousness* (1881), basing his results on the climate and mode of life in America. He died 23d January 1883.

Beard Moss. See USNEA, BROMELIACEÆ.

Beardsley, AUBREY, a remarkable designer in black and white, born at Brighton in 1872, for a while was in an architect's, and then in the insurance office. He began working for the illustrated papers in 1892, and became well known through his illustrations in the *Fellow Book* (1894, &c.) and a long series of publications. He died, a Catholic since 1897, on the 18th March 1898. He sometimes defied proportion and perspective as well as his *bête noire*, convention, but in his best work, which was ornamental rather than illustrative, showed extraordinary skill in black and white. See a book on him by Symons (1898), the memoir by Ross prefixed to the *Volpone* illustrated by him (1898), a book on his *Later Work* (1900), and a volume of his essays (1904).

Beardsley, EBEN EDWARDS (1808-91), born at Stepany, Conn., became rector of an Episcopal church in New Haven, and wrote on the church history of Connecticut and of the Episcopal Church in the United States—one of his works being the life of Bishop Seabury.

Bearer Subdivision is a part of the military organisation known as a Field Ambulance (see AMBULANCE), each of which has three. Each subdivision has a personnel of about 40 of the Army Medical Corps, including an officer, a sergeant, and 39 privates, providing 6 stretcher squads of 6 bearers each, with 3 or 4 ambulance-wagons. Drivers are supplied by the Army Service Corps. Complementary to each Bearer Subdivision is a Tent Subdivision, with personnel of from 60 to 70.

Bearing, of a ship at sea, is the direction in which she sails, in reference to the points of the compass. On shipboard, seamen often conveniently refer the bearing of another ship or of an object on shore not to the points of the compass, but to the line followed at the moment by their own ship's keel. Thus the bearing of the distant object may be *ahead*, *astern*, on the *starboard bow*, on the *port quarter*, &c.

Bear Lake, GREAT, in the north-west of Canada, is the most northerly of that series of fresh-water seas—Huron, Superior, Winnipeg, Athabaska, Great Slave, Great Bear—which mark a continuous depression in the middle of the continent. Lying 246 feet above sea-level, Great Bear Lake is irregular in shape, with a surface estimated at 11,821 sq. m. It sends forth a river of its own

name to the Mackenzie. As the Arctic circle passes over it, the climate is severe.

Bear-leader. In former times, bears were led about with a chain, muzzled, and made to dance or stand on their hind-legs for popular entertainment; small dancing-dogs being usually added, for the sake of attractiveness. From this old practice, which is not yet quite extinct, has been taken the phrase 'bear-leader,' used jocularly to signify a discreet person who takes charge of a youth of rank on his travels to see the world.

Béarn, formerly one of the thirty-two provinces into which France was divided, and now forming the greatest portion of the department of Basses-Pyrénées. The inhabitants are chiefly Gascons with a strong infusion of Basque blood, and they speak a characteristic Gascon dialect—which is practically a kind of Provençal (q.v.). Béarn was a portion of Aquitania under the Romans, and after the downfall of that empire, under its ruling dukes it was a country of considerable importance. From the intermarriage of the ruling family, the Counts of Foix, with that of Navarre, sprang the French monarch Henry IV., who, because he was born and brought up in Béarn, was derisively called *Le Béarnois*. When he ascended the throne of France, Béarn, of course, virtually became a part of that country, but was only formally incorporated with it in 1620 by Louis XIII.

See RIVAREZ, *Chansons et Airs populaires de Béarn* (1844); BOURDEAU, *Ancienne Gasconne et Béarn* (1862); CADIER, *Les États du Béarn* (1887); LESPEY, *Provinces du Béarn* (1893); also the articles BASQUES, GASCONY.

Bear River, a stream of Utah, U.S., which rises in the Rocky Mountains to the E. of Salt Lake, flows NW. into Idaho, then bends round and again returns into Utah, falling into Great Salt Lake. The Bear and Steamboat springs on its banks, in Idaho, are impregnated with magnesia and other minerals. Coal is found at the crossing of the Central Pacific Railroad.

Bear's Grease. Under this name there are sold pomades, represented to be of great efficacy in nourishing and promoting the growth of hair. These so-called preparations of bear's grease are for the most part composed of purified beef-marrow, hog's-lard, or fat of veal, and spermaceti, along with almond oil, and some scenting ingredients. See HAIR.

Beás, an Indian stream, one of the 'Five Rivers' of the Punjab, rises in the Snowy Mountains of Kulu, at an altitude of 13,326 feet above sea-level. It flows through the Kangra Valley, and generally SW., to the plains of the Punjab, where it joins the Sutlej at the south-western boundary of Kapurthala State, after a course of 290 miles.

Beast, NUMBER OF THE. See APOCALYPTIC NUMBER.

Beast-fables, stories in which animals play human parts, a widely-spread primitive form of literature, often surviving in more or less developed forms in the more advanced civilisations. No better example of its simplest form could be found than those stories of the negroes within the Southern States of America, which, through Harris's *Uncle Remus*, are now so well known to the reading public in England as well as America. The primitive natives of many parts of Africa still tell stories similar to these, and indeed they have acquired no very exalted notions of the inherent superiority of the human race, and admit without difficulty that the wisdom of the lower animals may be equal to their own. 'It is not a little curious,' says Sayce, 'to find that the chief home of the beast-fable should be Africa, and especially those backward tribes of Southern Africa whose

languages contain in their clicks the bridge that marks the passage of inarticulate cries into articulate speech. It seems as if the same conservatism which has preserved the animal sounds out of which language was developed, has preserved also a sympathy with the animal world, a memory of the close ties which unite us with it.' A striking instance of the naturalness of this form to the negro mind is seen in the fact that when the Vâi tribe of Mandingau negroes in Liberia had developed a system of writing (1830-40), their first essays in composition were rude fables about beasts. Even in the advanced civilisation of ancient Egypt, the beast-fable held an important place; indeed, it is not improbable that here it may have made its first appearance, and that its popularity may have been in large measure due to the deep respect of the ancient Egyptian for the unerring instinct of animals, which went side by side with the animal-worship that was so marked a characteristic of his religion. We find the 'Lion and the Mouse' in a papyrus dating from 1200-1166 B.C.—the days of Rameses III. (Rhampsinitus) or Hak On—not as a rude and early attempt, but in a finished form postulating a much more ancient origin. Sir Richard Burton points out that from Kemi, the Black-land, it was but a step to Phœnicia, Judæa, Phrygia, and Asia Minor, whence a ferry led over to Greece. Here the apologue found its populariser in Aisôpos, whose name, involved in myth, possibly connects with Aithiops. The fabulist's era may be taken as contemporary with Solon (570 B.C.), about a century after Psammetichus (Psamethik I.) threw Egypt open to the restless Greek. From Africa, too, the fable would spread eastwards, and find a new home in the second great focus of civilisation in the Tigris-Euphrates Valley; while in later days the conquests of Alexander and his successors Hellenised the eastern world, and carried with their victorious arms every form of literature that had been fostered by the western peoples. Whether or no we can accept this historical chain as explaining the transmission of the beast-fable, at least it must be admitted that it is highly reasonable as a theory, and finds here and there strange verification. Even the Lokman of Arabian and Persian fable has a more than superficial likeness to the Æsop of history in his ugliness and his servile condition.

To us the allegory in such fictions seems fundamental, but it was not so to the primitive mind. To the savage the beast-fable is not nonsense, for he ascribes to the lower animals the power of speech and a nature resembling his own, and believes readily in transmigration and metamorphosis. Savage mythology is full of metamorphoses, and these happen still as contemporary events in Samoa and Sarawak. The belief in the affinity between man and animals in which primitive man has so nearly anticipated the would-be conclusions of certain advanced evolutionists belongs even now to half mankind, and most students of comparative religion maintain that in the other half the worship of animals represented an earlier stage in the religious evolution. The Australians, Kamchadales, Polynesians, North-American Indians, Basques, and Transylvanian Gipsies at the present day tell beast-fables into which as yet no moral lesson has entered. They have not yet reached the stage which Grimm, with the contempt of the true folklorist, describes as 'fables thinned down to mere moral and allegory,' and 'a fourth watering of the old grapes of an insipid moral infusion. Among the Zulus and Hottentots we find the same stories, informed with the true Æsopic humour. Indeed it is, as has been seen, among the Bushmen, that pure beast-fables still exist in their simplest and fullest form, and it

is among them also that the art of drawing animals with considerable skill has been cultivated from time immemorial, as is evidenced by the rock-paintings of Southern Africa. In the Bushmen's beast-fables, the hare, as among the American negroes, the rabbit, plays much the same clever part as the fox in our European examples, and 'fables that illustrate the superior cunning of the hare can be traced,' says Sayce, 'from the Bari of Central Africa through Malagasy, Swahili, Kafir, and Hottentot, back to the Bushmen, where he is associated with what Dr Bleek calls "a most unpronounceable click," not otherwise found in the language.' But indeed we find the beast-fable in all parts of the world. Thus in Mr Gill's *Myths and Songs from the South Pacific*, a shak speaks and acts like a man, and Mr Ridley tells us the Australians ascribe human speech and action to the pelican and the musk-duck. The question need not now be raised whether these fables are really an indigenous native literature—it is sufficiently striking and significant to find here stories almost identical with those found among widely different people in widely distant regions. In our civilised world the animal-story lingered long after the moral beast-fable had become predominant. The crows of Æsop had croaked their wisdom through the medium of Babrius and Phædrus for a thousand years before the genuine beast-epic reached its highest development in *Reynard the Fox* (q.v.), belonging to the 12th century, but containing materials of a far earlier date. It is not a didactic poem, nor essentially even a satirical poem. Its charm lies in the admirable manner in which the characters of the various animals are sustained. Its influence in the middle ages may be partly understood from the fact that our common names *Reynard*, *Bruin*, and *Chanticleer* were originally the names of the characters in the great beast-fable.

Beast-fables, resembling more particularly the African, have been found in the cuneiform inscriptions of Babylonia. Four excellent examples have been preserved among the fragmentary records of Assur-bani-pal's library: the first narrating the actions of an eagle and a serpent; the second, of a fox and jackal; the third gives a discussion between a horse and an ox; while in the fourth a calf speaks. Jotham's story in the Book of Judges makes the trees talk to one another. So in the Iddubar legends of Babylonia, the trees answer Hea-bani.

Stories of the same nature are equally common farther east in Asia. Perhaps no book has been more widely popular than the fables of Bidpai (q.v.), translated first into Pehlevi or ancient Persian from an old Indian original, in part represented now by the *Panchatantra* (q.v.). The Indian fables differ from the Æsopic in this: in the former, animals act as men in form of animals; in the latter, animals are allowed to act as animals. Benfey ascribes this peculiarity of Indian conception to the belief in Metempsychosis (q.v.), and the exclusively didactic nature of Indian tales. All tales, therefore, in which animals play the part of human beings are Indian. As to the ultimate origin of beast-fables, Benfey's conclusion is that most fables about animals are western or Æsopic; that, on the contrary, the tales are Indian. In all our folk-tales the relations between the heroes and animals are usually kind or helpful. Nothing is more common than for the hero to do some kindness to a suffering animal, who afterwards shows his gratitude by some signal service to his benefactor at the moment of his own perplexity. Beasts and birds often carry grave secrets to favoured individuals, and so save them from unhappiness and

danger. If this feeling for animals is not of Buddhist origin, it is at least, as Cosquin points out, a prevailing Indian idea, and is certainly derived from the belief in metempsychosis, which effaces the distinction between man and the animal, and which in every living thing sees a brother. Benfey throws out the hint that metempsychosis may have come from Egypt. It does not occur in any of the Indo-European races save the Indians themselves, and undoubtedly intimate relations once existed between the Indus and the Nile. The Phœnicians were active intermediaries of commerce, and just as it is very probable they carried writing to India, they may have carried and re-carried many other elements of civilisation. Sir Richard Burton will have none of Benfey's refinement of distinction between the Æsopic and the Hindu apologue, and adds: 'The essence of the beast-fable is a reminiscence of *Homo primigenius*, with erected ears and hairy hide, and its expression is to make the brother brute behave, think, and talk like him with the superadded experience of ages. To early man the "lower animals," which are born, live, and die like himself, must have seemed quite human enough and on an equal level to become his substitutes. The savage, when he begins to reflect, would regard the carnivore and the serpent with awe, wonder, and dread; and would soon suspect the same mysterious potency in the brute as in himself: so the Malays still look upon the Uran-utan, or Wood-man, as the possessor of superhuman wisdom. The hunter and the herdsman, who had few other companions, would presently explain the peculiar relations of animals to themselves by material metamorphosis, the bodily transformation of man to brute, giving increased powers of working him weal or woe. A more advanced stage would find the step easy to metempsychosis, the beast containing the Ego (*alias* soul) of the human: such instinctive belief explains much in Hindu literature, but it was not wanted at first by the apologue.' There are many apologues in the *Arabian Nights*, but these are much longer and more involved in circumstance than the straightforward fables of Æsop, with their single event and simple moral. But these, despite their monumental antiquity, Burton regards as the offspring of a comparatively civilised age, when a jealous despotism or a powerful oligarchy threw difficulties and dangers in the way of speaking plain truths. He adds: 'A hint may be given, and a friend or foe can be lauded or abused as Belins the sheep, or Isengrin the wolf, when the author is debarred the higher enjoyment of praising them or dispraising them by name. And, as the purposes of fables are twofold, the speaking of brute-beasts would give a piquancy and a pleasantry to moral design as well as to social and political satire.' The danger of attempting openly to administer plain reproof to absolute Asiatic potentates may well have led to the invention of fables in which the lessons intended to be imparted were veiled under ingenious fictions of animals. Mr Clouston quotes the following story from an oriental historian of a tyrannical monarch having been reclaimed by such means. 'A wise and prudent vazir once related the following fable to his royal master: There was an owl in El-Basra and an owl in El-Mosul. And the owl of El-Basra said to the other one day: "Give me thy daughter in marriage to my son." Quoth the owl of El-Mosul, "I consent, on condition that thou give me as her dowry a hundred ruined villages." "That," replied the owl of El-Basra, "I cannot do at present; but if Allah spare the sultan another year, I will go what thou requirest." The sultan, deeply impressed by this simple fable, at once caused all the ruined towns and villages to be rebuilt, and henceforward studied to promote the

well-being of his subjects, and to render his rule easy and acceptable to them.'

Reinsch, 1890); Goldstaub and Wendtner's *Venetian Lattarius* (1892); Nover's *Thiersage* (1893); and books cited at ANIMALS (WORSHIP OF), FABLE, FOLKLORE, REYNARD THE FOX, and TOTEM. Also compare Rudyard Kipling's own beast-fables in his *Jungle Books* (1894 and 1895).

Beat is a phenomenon in sound caused by interference, and is of practical importance in the art of tuning instruments; see the article SOUND. The word is also used for the signal given by the hand or foot of the conductor of a musical performance, to enable the performers to keep time. Formerly various graces or ornaments in music, such as the reversed shake, were called by this inconvenient name.

Beatenberg, or SANKT BEATENBERG, is a small Swiss health-resort a little to the north of the Lake of Thun, about five miles WNW of Interlaken.

Beatification, an inferior degree of canonisation introduced in the 12th century, is a solemn act in the Catholic Church, by which the pope, after scrutinising the virtues and miracles of a deceased person, pronounces him to be among the blessed. After this his cultus is authorised, not universally as in canonisation, but in some district or order of the church. Beatification is generally a step towards Canonisation (q.v.). Thus Joan of Arc was beatified on the 18th April 1909, sanctified in 1920.

Beating the Bounds. See BOUNDS.

Beaton, or BETHUNE, DAVID, Cardinal and Primate of Scotland, was a younger son of John Beaton of Balfour, in Fife. Born in 1494, he was educated at the universities of St Andrews and Glasgow, and afterwards studied theology and law at Paris. His tact and general abilities recommended him to the Duke of Albany, regent during the minority of James V., who in 1519 appointed him resident for Scotland at the French court. In 1525 he took his seat in the Scots parliament as abbot of Arbroath; his uncle, James Beaton, on being translated three years before from the archbishopric of Glasgow to St Andrews, having resigned to him that abbey, with half the rents. In 1528 Beaton was appointed Lord Privy Seal, and he is said to have been the adviser of James V. in instituting the College of Justice or Court of Session in Scotland, the idea of which was suggested by the constitution of the parliament of Paris. Beaton subsequently was twice sent ambassador to France, to negotiate James's two marriages. During his residence at the French court, he was admitted to all the privileges of a French citizen, and in 1537 was appointed by Francis I. Bishop of Mirepoix in Foix. After his return, he became coadjutor to his uncle in the see of St Andrews, and in 1538 was by Pope Paul III. elevated to the dignity of a cardinal. On his uncle's death in 1539, he succeeded him as Archbishop of St Andrews and Primate of Scotland, and soon commenced a persecution of the Reformers, already numerous and increasing. That he might be invested with supreme authority in all matters ecclesiastical, he obtained from the pope the appointment of *legatus a latere* in Scotland, and induced the king to institute a Court of Inquisition, to inquire after heretics in all parts of the kingdom. To maintain the French influence, and prevent all danger to the Catholic Church in

Scotland from a friendly connection with England, he contrived to frustrate a proposed meeting of King James with his uncle, Henry VIII., and even prevailed on the former to declare war against England. On James's death, after the disastrous overthrow of the Scots at Solway Moss (1542), Beaton produced a forged will, appointing himself and three others regents of the kingdom during the minority of the infant Queen Mary. The nobility, however, rejected the fictitious document, and elected the Earl of Arran regent, who then professed the reformed faith. Beaton next month was arrested and imprisoned, accused, among other charges, of a design to introduce French troops into Scotland, in order to stop the negotiations then in progress with Henry of England for a marriage between the young Prince of Wales and Queen Mary. He was soon after liberated, and reconciled to the regent, whom he induced to abandon the English interest, and publicly to abjure the reformed religion. On the young queen's coronation in 1543, Beaton was again admitted of the council, and appointed chancellor. During a provincial council of the clergy held at Edinburgh, at which he presided, he caused the celebrated preacher, George Wishart (q.v.), to be apprehended at Ormiston, and conveyed to the castle of St Andrews, where he was burnt at the stake, Beaton and other prelates witnessing his sufferings from a window. A conspiracy having been formed against him, at the head of which were Norman Leslie, Master of Rothes, and Kirkcaldy of Grange, Beaton was assassinated in his own castle of St Andrews, 29th May 1546. Though endowed with great talents, Beaton possessed little learning, and the ascription of certain works to him rests on no valid authority. Haughty, cruel, and intolerant, he was also licentious in the extreme. He had seven natural children, four sons and three daughters—the latter married into families of distinction. One of his sons turned Protestant. The popular feeling about his death is expressed in the lines attributed to Sir David Lyndsay: 'Although the loon is weel away, The deed was foully done'; and Knox speaks of the assassination as a 'godly fact.'

See the *Life* by Herkless (1891); Herkless and Hannay, *The Archbishops of St Andrews* (1907-10); the articles SCOTLAND, JAMES V., MARY QUEEN OF SCOTS, KNOX, and works there cited.

Beaton, JAMES, an uncle of the cardinal's, took his M.A. at St Andrews in 1493, and rose rapidly to be Archbishop of Glasgow (1509), and of St Andrews (1522). One of the regents during James V.'s minority, he upheld the Hamilton against the Douglas faction. To the Edinburgh street-fight between them, famous in history as 'Cleanse the Causeway' (30th April 1520), he came wearing mail beneath his episcopal habit; but when Gawain Douglas, the poet-bishop of Dunkeld, besought him to stay the impending conflict, he swore on his conscience that he knew nothing thereof. His armour rattling as he struck his breast called forth the rebuke, 'My lord, your conscience clatters.' The Hamiltons lost the day, and Beaton himself owed his life to Bishop Gawain. In 1526 he had, says Pittcottie, 'to keep sheep in Balgrumo,' whilst the Douglasses plundered his castle; but he was soon reinstated in his see, and

figured as a zealous supporter of France, and an opponent of the Reformation, Patrick Hamilton and three other Protestants being burnt during Beaton's primacy. He died at St Andrews in 1539.—Another JAMES BEATON, nephew to the cardinal, was born in 1517, and in 1552 was consecrated to the archbishopric of Glasgow. He stood high in favour with the queen-regent, Mary of Lorraine, and it was to him that she handed the Lords' remonstrance (1557) with the remark, 'Please you, my lord, to read a pasquil.' On her death in 1560 he withdrew to Paris, and there he dwelt as Scottish ambassador, honoured by all men for his blameless life, till his death on 30th April 1603. See Herkless and Hannay, *The Archbishops of St Andrews* (vol. iii. 1910).

Beattie, JAMES, poet and essayist, was born at Laurencekirk, Kincardineshire, 25th October 1735; studied at Marischal College, Aberdeen (1749-53); was for five years schoolmaster to Fordoun parish; in 1758 was appointed a master of Aberdeen grammar-school, and in 1760 professor of Moral Philosophy in his old college. He had published three or four volumes of verse, when in 1770 appeared his *Essay on Truth*, an onslaught upon Hume, which met with most extravagant success. The author himself naturally shared the popularity of his essay. He was introduced to George III. (1773); dignitaries of the English Church solicited him to take orders, with promise of high preferment; but neglect has long since overtaken his treatise, which indeed is essentially commonplace. In 1771 appeared the first part of *The Minstrel*, and in 1774 the second. It is rich in picturesque descriptions, while the versification has a quiet fullness of melody. The poem describes 'the progress of a poetical genius born in a rude age, from the first dawning of fancy and reason, till that period at which he may be supposed capable of appearing in the world as a minstrel.' Beattie intended to add a third part, but circumstances hindered him. In 1776 he published a series of essays on *Poetry, Music, &c.*, in 1783 *Dissertations Moral and Critical*, in 1786 *The Evidences of the Christian Religion briefly and plainly stated*, and in 1790-93 *The Elements of Moral Science*, all of which works are written in a clear and elegant style, and with a high appreciation of the good and beautiful. He died 18th August 1803. See his *Life* by Sir William Forbes (1806), Miss Margaret Forbes's *Beattie and his Friends* (1904), and (for letters) Mackie's *James Beattie the Minstrel* (1908).

Beatty, DAVID, first EARL, admiral, born in County Wexford in 1871, entered the navy in 1884, and served in the Sudan (1896-98) and China (1900). Attaining flag rank at the age of 38, he took command of the first battle-cruiser squadron in 1912, distinguished himself in the battles of Heligoland Bight (28th August 1914), Dogger Bank (24th January 1915), and Jutland (31st May 1916), and in 1916-19 was Lord Jellicoe's successor as commander-in-chief of the Grand Fleet. Knighted in 1914, he was given in 1919 the Order of Merit, the rank of Admiral of the Fleet, an earldom and £100,000, and became First Sea Lord. For his battles, see TACTICS, WAR (GREAT).
